The numbers of wild elephants, in some parts both of the East Indies and of Africa, are being gradually reduced as cultivation extends, and many are shot for no other reason than a desire to reduce their numbers, and put an end to their ravages on cultivated grounds. A reward of a few shillings per head was claimed for 3,500 destroyed in part of the northern province alone of Ceylon, in less than three years prior to 1848. It is for the sake of ivory that the greatest slaughter of elephants takes place. A ball of hard metal, skillfully planted in the eye, base of the trunk, or behind the ear, generally ends an E.'s life in an instant; and expert *sportsmen* have been known to kill right and left one with each barrel.

Fossil Elephants.—The E. makes its appearance in the pleistocene strata. Its near ally, the mastodon, whose remains are found associated with it, began life earlier; it has left its traces in miocene deposits. Ten species of fossil elephants have been described, the remains of three of which are found in Europe. The best known of these is the *elephas primigenius*, or mammoth, the tusks of which are so little altered as to supply an ivory which, though inferior to that of the living species, is still used in the arts, especially in Russia. Its tusks are, on this account, regularly searched for by "ivory hunters" in Siberia, where, in the superficial deposits of sand, gravel, and loam, the remains occur in enormous abundance. They are also found in similar strata all over Europe. In Britain, the localities that have supplied these remains are very numerous. They are especially abundant in the pleistocene deposits of the e. and s.e. of England. Woodward, in his *Geology of Norfolk*, calculates that upwards of 2,000 grinders of this animal had been dredged up by the fishermen off Happisburgh in thirteen years. The bone-caves also yield remains of this gigantic animal.

The mammoth truly belongs to the geological history of the world; it died out at the close of the period represented by the pleistocene beds. It is the only fossil animal that has been preserved in a perfect condition for the examination of man. In all other remains we have to deal with the hard portions only—the bones, teeth, scales, etc., and frequently only with fragmentary portions, requiring the skill of a Cuvier or an Owen to make from them an approximation to the perfect animal. But the mammoth has been preserved so that its flesh has been eaten by dogs, bears, and wolves. In 1799, a Tungusian, named Schumachoff, while searching along the shores of lake Oncoul for mammoth tusks, observed among the blocks of ice a shapeless mass, but did not at the time discover what it was. The heat of succeeding summers gradually melted the ice around it, and, in 1803, the mammoth fell on a bank of sand. In Mar. of the following year, the hunter visited it, cut off, and carried away the tusks, which he sold for fifty rubles. In 1806, Mr. Adams visited the locality, and examined the animal, which still remained on the sand-bank where it had fallen, but in a greatly mutilated condition. The Jakutski of the neighborhood had cut off the flesh to feed their dogs, and the wild beasts had almost entirely cleared the bones. The skeleton was, however, entire, excepting one of the forelegs, and some of the bones of the tail. Many of the bones were still held together by the ligaments and by parts of the skin. The head was covered with dry skin; one of the ears was well preserved; it was furnished with a tuft of hairs. Three fourths of the whole skin were procured, which was so heavy that ten persons found great difficulty in transporting it to the shore, a distance of 150 ft.; it was of a dark-gray color, and was covered with a reddish wool, and long black hairs or bristles. The wool was short, and curled in locks; the bristles were of different lengths, varying from 1 to 18 inches. Some of this covering still remained attached to the skin, but the great mass was entirely separated from it. Mr. Adams collected 36 lbs., although much of it had been destroyed from the dampness of the place where it had lain so long. The animal was a male, and had a long mane on the neck. The entire carcass was removed to St. Petersburg, where it is now preserved. The tusks were repurchased, and added to the animal. It measures from the fore part of the skull to the end of the mutilated tail 16 ft. 4 in.; the height to the top of the dorsal spines is 9 ft. 4 in.; the length of the tusks along the curve is 9 ft. 6 inches. Portions of the hairy covering have been brought to this country, and may be seen in the British museum.

Taking the teeth as exhibiting clearly a marked difference in the recent species, the mammoth is easily separated from both by its broader grinders, which have narrower, and more numerous, and close-set plates and ridges. The existence of the E. and other genera, whose representatives are now found only in the warmer regions of the earth, in the n. of Europe and Asia, led to the belief, that at the recent period in the world's history when they were its living inhabitants, a tropical temperature existed in the temperate zone, and stretched further n. towards the pole; but the discovery of this perfect animal showed that these huge elephants were adapted by their clothing to endure a cold climate, and by the structure of their teeth were able to employ as food the branches and foliage of the northern pines, birches, willows, etc. There are few generalizations more plausible at first sight than to predicate of an unknown species of a genus what is ascertained regarding the known members of the same genus. It required a striking case, such as that supplied by the discovery of the mammoth, to show clearly the fallacy of deductions which were almost universally received by scientific men not many years

ago, which still occasionally mislead, and which may even now be met with in some popular hand-books of science.

ELEPHANT. An order of the E. was instituted in Denmark, by king Frederick II. The badge was a collar of elephants towered, supporting the king's arms, and having at the end the picture of the Virgin Mary.

ELEPHANT, SEA, *Macrorhinus proboscideus*, also known as the ELEPHANT SEAL, the PROBOSCIS SEAL, etc., is the largest of the seal family (*phocidæ*), an inhabitant of the seas of the southern hemisphere. It is more than twice as large as an elephant, being sometimes 30 ft. in length, with a circumference of about 18 ft. at the thickest part, which is at the chest, immediately behind the fore-flippers or swimming paws; the body tapering towards the tail. The color is grayish, bluish gray, or more rarely blackish brown. The whole body is covered with very short hair, distributed in patches, giving it a spotted appearance somewhat like watered silk. The swimming paws are large and powerful; the fore-paws have five nails, the thumb-nail easily distinguishable from the others; the hind-paws have not even the rudiments of nails, but are beautifully constructed like the webbed foot of a bird, so as to expand, and increase the power of swimming. The true nail is very short, not more than 6 in. long. The head is larger in proportion than in many seals; the eyes are very large and prominent, with eyebrows of coarse hair; the whiskers are composed of very long and coarse spirally twisted hairs; there are no external ears; the canine teeth are remarkably large and massive, somewhat assuming the character of tusks. The nose of the males is very remarkable, being prolonged into a kind of proboscis of about a foot long, which, however, is not at all an organ of prehension, and, indeed, seems to serve no purpose whatever analogous to those which are served by the proboscis of the elephant, but in its ordinary state hangs flaccid on the face, becoming distended like the wattle of a turkey when the animal is roused to passion of any kind, and in particular presenting this distended appearance during the rutting season. At that season, also, the males have furious combats, the victor winning for himself a whole herd of females. When the proboscis is dilated, the voice of the sea-elephant, which usually is like the lowing of an ox, is completely changed, and becomes a loud and extraordinary gurgling.

Sea-elephants are found on Kerguelen's Land, Juan Fernandez, South Georgia, the States islands, South Shetland, the Falkland islands, etc. They migrate southwards at the beginning of summer, and northwards at the approach of winter, thus avoiding the extremes of heat and cold. A single individual sometimes yields 1400 or 1500 pounds or 70 gallons of excellent oil, on account of which these animals are pursued to an extent that seems to have already much reduced the numbers of the species. They are either shot or killed by means of long lances. Cuttle-fish and other cephalopods seem to be their principal food; but remains of marine plants have also been found in the stomach.

The skin of the sea-elephant is not at all valued on account of its fur, but its thickness and strength make it very useful for harness-making and similar purposes. The flesh is black, oily, and indigestible; the tongue (salted) alone being esteemed a delicacy. The principal product, however, is the oil, which burns slowly, with a clear flame, and without smoke or disagreeable odor.

ELEPHANTA, an island of 6 m. in circuit, stands in the harbor of Bombay (q.v.), about 7 m. to the e. of that city, and about 5 m. to the w. of the mainland. It takes this its European name from a huge figure of an elephant near its principal landing-place, which, however, appears to have gradually crumbled away. This colossal animal has been cut out of a detached rock, which is apparently of basaltic origin. Further towards the interior, three temples, dug out of the living mountain, present themselves—the roofs being supported by curiously wrought pillars of various forms and magnitudes, and the walls being thickly sculptured into all the varieties of Hindu mythology. The largest of the three excavations is nearly square, measuring 133 ft. by 130½ ft.; and immediately fronting its main entrance stands a bust or third-length of a three-headed deity, with a height of 18 ft., and a breadth of 23. These monuments of superstition, like the quadruped which guards, as it were, the approaches to them, are said to be rapidly decaying—a state of things which, besides in some measure accounting for the execution of such works, seems to be inconsistent with any very high antiquity. The island is in lat. 18° 57′ n., and long. 73° east.

ELEPHANTI'ASIS is a term applied to two varieties of skin-disease, in which the limbs, from their enlargement, and from the changed condition of the skin, have a slight resemblance to those of the elephant. There is the *elephantiasis of the Greeks*, which is usually regarded as the same as the eastern leprosy, and as the *spedalskhed* of Norway; and the chief features of which are described in the article LEPROSY. In this affection, the size of the limbs and the state of the epidermis are comparatively slightly altered. In the *elephantiasis of the Arabs*, which seems to be identical with the *Barbadoes leg*, (q.v.), there is great enlargement of the affected parts, and the skin is much thickened.

ELEPHANTINÉ, a small island of the Nile, lying opposite to Assouan (q.v.), the ancient Syene, on the confines of Egypt and Nubia, in 24° 5′ n. lat., and 32° 34′ e. long. From this island, the Greek mercenaries were sent by Psammitichus I. to recall the

Egyptian deserters, and it was garrisoned in the time of the Pharaohs, Persians, and Romans. The island was anciently called *Abu*, or the "ivory island," from its having been the entrepot of the trade in that precious material. The most important ruins are a gateway of the time of Alexander, and a small temple dedicated to Khnum, the god of the waters, and his contemplar deities, Anucis and Sate. This temple was founded by Amenophis III., and embellished by Rameses III. Another remarkable edifice is the ancient Nilometer, formerly mentioned by Strabo, and which appears to have been built in the time of the Cæsars; and several remaining inscriptions record the heights of inundation from the time of Augustus to Severus. This island had the honor of giving a dynasty (the 5th) to Egypt, and was evidently an important place, the inscriptions on the rocks attesting the adoration paid by Sethos I., Psammitichus II., and other monarchs, to the local deities. Other interesting monuments have been found on this island: amongst which may be cited part of a calendar recording the rise of the dog-star in the reign of Thothmes III. (1445 B.C.), and numerous fragments of pottery—principally receipts in the Greek language—given by the farmers of the taxes in the reign of the Antonines. The island is at present inhabited by Nubians.—Wilkinson, *Topography of Thebes*, p. 460; Champollion, *Notice Descriptive*, p. 215; Champollion, *Lettres Ecrites*, pp. 111, 157, 171, 382.

ELEPHANT'S FOOT, or HOTTENTOT'S BREAD (*testudinaria elephantipes*), a plant of the natural order *dioscoreaceæ*, of which the root-stock forms a large fleshy mass, curiously truncate, or abruptly cut off at the end, so as somewhat to resemble an elephant's foot, and covered with a soft, corky, rough, and cracked bark. From this springs a climbing stem, which bears the leaves and flowers. The root-stock is used as food by the Hottentots. The plant is not unfrequently to be seen in hot-houses in Britain.

The name ELEPHANT'S FOOT (*elephantopus*) is also given, on account of the form of the root-leaves, to a genus of plants of the natural order *compositæ*, sub-order *corymbiferæ*, one species of which (*E. scaber*) is common in elevated dry situations in all parts of India, and is used in Indian medicine in affections of the urinary organs.

ELETTA'RIA. See CARDAMOMS.

ELETZ. See JELETZ.

ELEUSINE, a genus of grasses, chiefly natives of India and other warm climates, several of which are cultivated as grains. This is especially the case with *E. corocana*, an Indian species, called natchnee and nagla ragee, also mand and murwa, which has aggregated digitate spikes finally incurved. The Thibetans make a weak sort of beer, much in use amongst them, from this grain. *E. stricta* is cultivated as a grain-crop in the same parts of the world, and is, like the former, extremely productive. The grain called tocusso in Abyssinia is also a species of this genus, *E. tocusso*.—A decoction of *E. Ægyptiaca* is used in Egypt for cleansing ulcers; and a drink made from the seeds is regarded as useful in diseases of the kidneys and bladder. A decoction of *E. Indica* is also administered to infants in Demerara, to prevent or cure convulsions.

ELEUSIN'IAN MYS'TERIES, the sacred rites with which the annual festival of Ceres was celebrated at Eleusis. Many traditions were afloat in ancient times as to the origin of this festival. Of these, the most generally accepted was to the effect that Ceres, wandering over the earth in quest of her daughter Proserpine, arrived at Eleusis, where she took rest on the *sorrowful stone* beside the well Callichorus. In return for some small acts of kindness, and to commemorate her visit, she taught Triptolemus the use of corn on the Rharian plain near the city, and instituted the mystic rites peculiarly known as hers. The outward method of the celebration of these mysteries is known with considerable accuracy of detail. Their esoteric significance is very variously interpreted. The ancients themselves generally believed that the doctrines revealed to the initiated gave them better hopes than other men enjoyed, both as to the present life and as to a future state of existence. Modern speculation has run wild in the attempt satisfactorily to explain these mysteries. As reasonable a solution as any other seems to be that of bishop Thirlwall, who finds in them "the remains of a worship which preceded the rise of the Hellenic mythology and its attendant rites, grounded on a view of nature, less fanciful, more earnest, and better fitted to awaken both philosophical thought and religious feeling." The festival itself consisted of two parts, the greater and the lesser mysteries. The less important feast, serving as a sort of preparation for the greater, was held at Agræ, on the Ilissus. The celebration of the great mysteries began at Eleusis on the 15th day of Boëdromion, the third month of the Attic year, and lasted over nine days. On the first day (called *agurmos*, the assembling), the neophytes, already initiated at the preparatory festival, met, and were instructed in their sacred duties. On the second day (called Haladé, mystæ, *To the sea, ye initiated!*), they purified themselves by washing in the sea. On the third day, sacrifices, comprising, among other things, the mullet-fish, and cakes made of barley from the Rharian plain, were offered with special rites. The fourth day was devoted to the procession of the sacred basket of Ceres (the Kalathion). This basket, containing pomegranates, salt, poppy-seeds, etc., and followed by bands of women carrying smaller baskets similarly filled, was drawn in a consecrated cart through the streets, amid shouts of "Hail, Ceres!" from the onlookers. The fifth day was known as the "day

of the torches," and was thought to symbolize the wanderings of Ceres in quest of her daughter. On it the mystæ, led by the "daduchus," the *torch-bearer*, walked two by two to the temple of the goddess, and seem to have spent the night there. The sixth day, called Iacchus, in honor of the son of Ceres, was the great day of the feast. On that day the statue of Iacchus was borne in pomp along the sacred way from the Ceramicus at Athens to Eleusis, where the votaries spent the night, and were initiated in the last mysteries. Till this stage of the proceedings, they had been only *mystæ;* but on the night of the sixth day they were admitted into the innermost sanctuary of the temple, and, from being allowed to behold the sacred things, became entitled to be called "epoptæ," or "ephori;" i.e., *spectators*, or *contemplators*. They were once more purified, and repeated their original oath of secrecy with an imposing and awful ceremonial, somewhat resembling, it is believed, the forms of modern freemasonry. On the seventh day, the votaries returned to Athens with mirth and music, halting for a while on the bridge over the Cephisus, and exercising their wit and satire against the spectators. The eighth day was called Epidauria, and was believed to have been added to the original number of the days for the convenience of those who had been unable to attend the grand ceremonial of the sixth day. It was named in honor of Æsculapius, who arrived on one occasion from his native city of Epidaurus too late for the solemn rites, and the Athenians, unwilling to disappoint so distinguished a benefactor of mankind, added a supplementary day. On the ninth day took place the ceremony of the "Plemochoæ," in which two earthen vessels filled with wine were turned one towards the e., and the other towards the west. The attendant priests, uttering some mystic words, then upset both vessels, and the wine so spilt was offered as a libation.

Initiation into the Eleusinian mysteries was compulsory on every freeborn Athenian; but slaves, prostitutes, and persons who had forfeited their citizenship were excluded from the rites. During the period of the festival, none of those taking part in it could be seized or arrested for any offense. Lycurgus, with a view to destroying distinctions of class, forbade any woman to ride to the Eleusinia in a chariot, under a penalty of 6,000 drachmæ. The mysteries were celebrated with the most scrupulous secrecy. No initiated person might reveal what he had seen under pain of death, and no uninitiated person could take part in the ceremonies under the same penalty. The priests were chosen from the sacred family of the Eumolpidæ, whose ancestor, Eumolpus, had been the special favorite of Ceres. The chief priest was called the "Hierophant," or "Mystagogue;" next in rank to him was the Daduchus, or Torch-bearer; after them came the "Hiero-Ceryx," or sacred herald, and the priest at the altar. Besides these leading ministers, there was a multitude of inferior priests and servants.

ELEU'SIS, a celebrated t. in ancient Attica, stood near the northern shore of the gulf of Salamis, and not far from the confines of Megaris. It was famous as the chief seat of the worship of Ceres, whose mystic rites were here performed with great pomp and solemnity from the earliest authentic times till the era of Alaric. See ELEUSINIAN MYSTERIES. The temple of the goddess, designed by Ictinus, the architect of the Parthenon, was the largest sacred edifice in Greece. The site of the old Eleusis is now occupied by the little village of Lefsina or Lepsina.

ELEU'THERA, one of the Bahamas (q.v.), is, next to New Providence, the most populous island in the whole chain. Including its dependent *cayos* or *keys*, E. has a pop. of 5,209. It is more fertile than most of its neighbors, more especially surpassing all of them in the growth of fruit, such as the pine-apple, the orange, and the lemon.

ELEUTHE'RIA, a festival of the Greeks, to commemorate their deliverance from the invader Xerxes, instituted after the battle of Platæa, 479 B.C. There was a semi-military parade, eulogies on the heroes who fell in the great battle, the sacrifice of a bull to Jupiter and Mercury, and the sprinkling of the ground with wine.

ELEUTHE'RIA BARK, a name not unfrequently given to the bark of the *croton eleutheria*, also known as cascarilla bark. See CASCARILLA. It is called eleutheria (or eleuthera) bark, because it is chiefly gathered on the island of Eleuthera.

ELEVATED. Wings turned upwards are described in heraldry as elevated.

ELEVA'TION, in architectural drawing, is the representation of the flat side of a building, drawn with mathematical accuracy, but without the slightest attention to effect. In art, again, elevation is a raising of the subject beyond its ordinary character in real life. A very good instance of elevation in this sense is given by Fairholt in his *Dictionary of Terms in Art*, in Rembrandt's "Adoration of the Shepherds." The whole of the objects and surroundings of the infant Saviour are of the most homely description; and still the light which is represented as issuing from his person gives an elevation to the scene which takes off from it entirely the character of being commonplace or vulgar.

ELEVATION, in astronomy and geography, means generally the height above the horizon of an object on the sphere, measured by the arc of a vertical circle through it and the zenith. Thus, the elevation of the equator is the arc of a meridian intercepted between the equator and the horizon of the place. The elevation of the pole is the complement of that of the equator, and is always equal to the latitude of the place. The

elevation of a star, or any other point, is similarly its height above the horizon, and is a maximum when the star is on the meridian.

ELEVATION OF THE HOST (Host, *ante*). Members of the church of Rome worship the host under the assumption that the bread and wine in the Lord's supper are transubstantiated into the real body, blood, and divinity of Christ, who is, on each celebration of the sacrament, offered up anew as a victim (*hostia*) by the priests. The council of Trent, having determined that upon consecration the bread and wine of the sacrament are changed into the body of the Lord Jesus Christ, true God and true man, gave this decision: "There is, therefore, no room to doubt that all the faithful in Christ are bound to venerate this most holy sacrament, and to render thereto the worship of *latria*, which is due to the true God according to the constant usage of the Catholic church." In conformity with this decision, the rubric of the missal says: "Having uttered the words of consecration, the priest immediately, falling on his knees, adores the consecrated host; he rises, shows it to the people, places it on the corporale, and again adores it." Rising up after he has adored it, he elevates it before the people, who, as soon as they see it (having notice also by the ringing of the bell), fall down in humble adoration to it as if it were God himself. They pray to it, and use the same acts of invocation as they use to Christ. The host is also elevated for worship when it is carried through the streets in solemn procession, on its way to the dwellings of the sick, or on the feast of Corpus Christi, or before the pope. The custom of thus elevating the host was introduced into the church of Rome in 1216, the year after transubstantiation was made an article of faith. Pope Honorius then ordered that the priests, at a certain point of the mass service, should lift up the host and cause the people to prostrate themselves in worshiping it.

ELEVENTH, in music, is the interval of the octave above the fourth.

ELF, a fairy, pl. Elves. See Fairies.

ELF-ARROW-HEADS, Elfin-arrows, Elf-bolts, Elf-darts, Elf-shot, and Elf-stones, names popularly given in the British islands to the arrow-heads of flint which were in use at an early period among the barbarous tribes of this country and of Europe generally, as they are still in use among the American Indians, the Esquimaux of the Arctic regions, and the inhabitants of some of the islands in the Pacific ocean. It was believed that elves or fairies, hovering in the air, shot these barbs of flint at cattle, and occasionally even at men. Thus, Robert Gordon, of Straloch, an accomplished country gentleman of the n. of Scotland, writing in 1654, tells how one of his friends, traveling on horseback, found an elf-arrow-head in the top of his boot, and how a gentlewoman of his acquaintance, when out riding, discovered one in the breast of her habit. He remarks that, although they are got by chance in the fields and on the highways, one who goes to look for them on purpose will search in vain. He adds that they are most commonly met with after showers—a circumstance which probably helped them in Germany to their names of "thunder-bolts" and "thunder-stones," and is easily enough explained. The rain, by washing away the earth in which they have been imbedded, makes them more readily perceptible to the eye, especially if the sunshine happens to fall upon them. Cattle dying suddenly in the fields were believed to have been struck by elf-arrows—a belief which yet lingers in Ireland, and perhaps in some secluded parts of Scotland. "Thus, when cattle are sick," writes Mr. W. R. Wilde, in his *Catalogue of the Antiquities in the Museum of the Royal Irish Academy* (Dub. 1857), "and the cattle doctor, or fairy doctor, is sent for, he says the beast has been 'elf-shot,' or stricken by fairy or elfin darts; and he forthwith proceeds to feel the animal all over; and, by some legerdemain, contrives to find in its skin one or more poisonous weapons, which, with some coins, are then placed in the water which is given it to drink; and so a cure is said to be effected." The elf-arrow-head was occasionally set in silver, so as to be worn on the person as a talisman, or had a hole drilled through it, so that it might be dipped in water, which, being thus endowed with healing virtue, was used sometimes as a wash, more commonly as a draught. As a talisman, the elf-arrow-head was believed to be most efficacious as a preservative from poison and witchcraft. The ascription of the flint arrow-head to the elves or fairies, is but one of several instances of the disposition of a people to elevate or degrade the earlier races whom they vanquished or dispossessed into mythical beings, better or worse than mankind. Thus, in Greece and Italy, the remains of the rude strongholds built by the Pelasgi came to be regarded as works of the fabled Cyclops, or one-eyed giants. So also, in Scotland, the sepulchral mounds of the aboriginal inhabitants were called "elf-hillocks;" and the vestiges of ancient plowshares which may be traced on heaths and hill-tops were called "elfin-furrows." Examples of "elf-arrow-heads" may be seen in most museums of antiquities. They fall to be more particularly described in a following page, under the head of Flint Implements and Weapons.

EL-GHOR, "*the valley,*" is, according to Robinson (*Phys. Geog.*, p. 73), the name now given to the northern part of the great depression which extends from the base of Mt. Hermon to the Red sea. The southern part retains the old Hebrew name, El-Arabah (q.v.), the boundary between the two being the range of chalk cliffs about 6 m. s. of the Dead sea. The length of El-Ghor, from the sea of Galilee to the Dead sea, is about 65

m., and between these points there is an average descent of over 10 ft. to a mile. The width of the valley varies from about 6 m. at the northern end to 10 or 12 in the neighborhood of Jericho. On the w. is a series of irregular and precipitous cliffs from 800 to 1200 ft. high, everywhere naked and desolate; on the e. the mountains are still higher. About 22 m. s. of the sea of Galilee the ridge Kum Surtabeh, crossing the valley obliquely, divides it into the upper and lower Ghor. At this point there is a sudden "break-down" in the bed of the Jordan. Above it the valley is generally well-watered and fertile; below, it becomes dry and desolate, being covered with a white nitrous crust. Within the general valley of El-Ghor there is a still lower depression, varying from a quarter to a half of a mile in width, through which the Jordan flows (q.v.).

ELGIN, a co. in the province of Ontario, Canada, on lake Erie and Thames river; intersected by the London and Port Stanley railroad; 725 sq.m.; pop. '71, 33,666. The co. town is St. Thomas.

ELGIN, a city in Kane co., Ill., on Fox river, at the junction of the Chicago and Pacific, and the Freeport and Dubuque branch of the Chicago and Northwestern railroads; 35 m. w. of Chicago; pop. '70 (of township), 5,441. The city is on both sides of the river, which affords abundance of water-power. The Elgin National Watch company is the most important of several manufacturing establishments, and its watches, made by machinery, are highly esteemed, and have an extensive sale. Elgin is the center of a fine agricultural region, and has a good trade.

ELGIN, a royal burgh, the co. t. of Elgin or Morayshire, and a station on the Inverness and Aberdeen Junction railway, situated on the right bank of the river Lossie, about 5 m. from the sea. Pop. '71, 7,339. E. joins with Banff, Peterhead, Inverury, Cullen, and Kintore, in returning a member to parliament. It was probably a royal burgh so early as the reign of king David I. (1124–53), and had its privileges confirmed by several of his successors. Its trade is now almost wholly retail. E. has 12 yearly fairs, and a weekly grain market. It has a parish church, which is collegiate, 2 free churches, 2 United Presbyterian churches, 1 Baptist church, 1 Original Secession, 1 Independent, 1 Episcopal, and 1 Roman Catholic; with 10 schools. Gray's hospital for the sick poor, built and endowed from a bequest of £20,000 by the late Dr. Alexander Gray, of Bengal, and opened in 1819, with a lunatic asylum attached, now the Elgin district asylum; and the Elgin or Anderson's institution for the support of old age and the education of youth, built and opened 1831–33, on the foundation of £70,000 bequeathed by the late maj.gen. Anderson, H.E I.C.S.—are the principal of many public and private charities. E. is chiefly remarkable for the beauty of its situation, lying placidly in a gentle curve of the Lossie, for the salubrity if its climate, and for its history as the see of the bishop of Moray. Its appearance, about 60 years ago, was that of a little cathedral city, with an antique fashion of building, and with "a certain solemn drowsy air about the town and its inhabitants." That appearance is fast giving way to that of a gay modern county town, surrounded by elegant villas. The old town was partially burned in 1390 by the notorious Wolf of Badenoch (Alexander Stewart, earl of Buchan); in 1402, by Alexander, the son of the lord of the Isles; and in 1452, by the earl of Huntly—this last calamity originating the proverb, "Half done, as Elgin was burned." Its once magnificent cathedral church, partly of early English and partly of middle-pointed architecture, dedicated to the Holy Trinity, was begun by bishop Andrew Moray in 1224, on the transference of the see from Spynie; was injured by fire in 1270; was nearly burned down by the Wolf of Badenoch in 1390; was restored under bishops Bur, Spyny, Innes, and Leighton (1390–1424); and from subsequent accident and dilapidation is now a mere ruin. The other religious buildings of the olden time were the church of St. Giles, a picturesque example of our old parish churches, replaced 1826–28 by the modern less interesting structure; the monastery of the Black Friars, long since demolished; the convent of the Gray Friars, the walls of whose church remain; the hospital of the Maison Dieu, on the site of which is Anderson's institution; the Leper house, still commemorated by the grounds called the Leper lands; and the chapel of St. Mary of the castle, which gave name to the Lady hill and Lady well on the w. of the town. The castle itself, styled of old the manor of Elgin, whose ruins, surmounted by an obelisk—erected to the memory of George, fifth and last duke of Gordon—crowned the Lady hill, was a residence of the earls of Moray, for some time superiors of the burgh under our Scottish kings.

ELGIN, THOMAS BRUCE, Earl of, 1766–1841; the seventh of the line, succeeding his brother in the earldoms of Elgin and Kincardine when but seven years old. He rose to be gen. in the British army; was envoy at Brussels, at Berlin, and at Constantinople. While at the latter place he secured and removed from Athens the sculptures known as the "Elgin marbles," now in the British museum. (See ELGIN MARBLES, *ante.*) Lord Elgin was a representative peer of Scotland for more than 50 years.

ELGIN AND KINCARDINE, Earl of, Governor-General of India. James Bruce, eighth earl of E., was b. in Park Lane, London, in 1811. He was educated at his father's seat, in Fifeshire, and afterwards went to Christ church, Oxford, where he was first-class in classics, 1832; became fellow of Merton, and graduated M.A., 1835. He

entered public life in 1841, when, as lord Bruce, he was returned at the general election on the conservative interest for Southampton. A petition was presented against the return, and the election was declared void. Before, however, a new writ could issue, lord Bruce had succeeded his father (who enriched the British museum by the invaluable collection of sculpture known as the "Elgin marbles," q.v.) as earl of Elgin. Those who remember his early parliamentary and pre-colonial career, state that he gave early promise of oratorical distinction, and assert that if he had thrown himself into the politics of the day, he would have taken a high position as a parliamentary debater. By succeeding to a Scotch peerage, however, he was, in his own words, "expelled from the house of commons without being admitted into the house of peers." Being offered the governorship of Jamaica, in Mar., 1842, by the earl of Derby—then lord Stanley—he went to Jamaica, where he administered the affairs of the island with so much ability and success, that in Aug., 1846, the governor-generalship of Canada was tendered to him by earl Grey, then secretary of state for the colonies in the administration of lord J. Russell. Lord E., still finding himself in the same position as a Scottish peer, accepted the office, and went to Canada. His administration of the government of Canada will ever be a bright spot in our colonial history, and a model to future governors of English dependencies. He found Canada governed by cliques, and torn by intestine feuds. With admirable tact and entire success, he inaugurated a system of self-government, which has rendered the provinces of British America a support to the British throne, in place of being a source of weakness. Under his government, Canada made such strides in importance and prosperity, that between 1847 (in the beginning of which year he entered upon his government) and 1855, when he returned to England, the revenue of that great British possession quadrupled itself. During his administration, he successfully negotiated a treaty for reciprocity of trade between British America and the United States, which admitted the whole produce of British North America to be brought into competition with the products of the United States in their own markets. This treaty, till it was renounced by the United States in 1866, put an end to the risk of collision as to the fisheries between this country and America, which lord E. described as the most serious risk which had presented itself during his public service. His popularity was great, not only in Canada but the adjacent states, the citizens of which offered him ovations. He was now a peer of the United Kingdom (having been summoned to the house of lords in 1849), and was appointed lord-lieutenant of Fifeshire. In 1857, the affair of the lorcha *Arrow*, and the bombardment of Canton, by sir John Bowring, led lord Palmerston to invite lord E. to go to China as plenipotentiary extraordinary. An army was equipped to carry out the policy prescribed by the British government, and he started on his mission. But before he could approach his destination, and when he had barely left England a month, the Indian mutiny broke out. Lord E. did not hesitate a moment in preferring the safety of India to the success of his Chinese negotiations. He dispatched the Chinese expedition to lord Canning's assistance, and the English in India were thus enabled to hold their ground until further reinforcements arrived. After thus consigning himself to an inaction of several months, lord E. proceeded to China, and in 1858, in conjunction with baron Gros, the French plenipotentiary, he negotiated the treaty of Tientsin, which promised to give Great Britain a freer access to China than she had ever enjoyed before. He found time, before his return, to negotiate a treaty with Japan, under which English manufactures are admitted at low rates of duty, and a British minister is permitted to reside at Jeddo. On his return home, he was appointed postmaster-general. He had scarcely time to become acquainted with his duties, before the treachery of the Chinese, in firing upon the British squadron from the Taku forts, led to the organization of another Chinese expedition, and to lord E.'s second mission to China. A combined English and French force penetrated to the capital, and enabled lord E. and baron Gros to dictate a peace under the walls of Pekin. On the expiration of viscount Canning's term of service, the governor-generalship of India was offered by lord Palmerston to lord E. (1861), and accepted by him. He died in India, Nov., 1863. Lord E. (who was the representative in the male line of the great Scottish house of Bruce) was twice married: in 1841, to the daughter of Mr. Cumming Bruce, M.P. (she died 1843); and in 1846, to the daughter of the first earl of Durham, by whom he had a son, Victor Alexander, present earl, born 1849, and other issue. Lord E. was K.T. (1847), privy councilor (1857), G.C.B., civil, extra (1858).

ELGIN MARBLES, a celebrated collection of ancient sculptures, brought from Greece by Thomas, seventh earl of Elgin, and acquired from him by the nation for the British museum in 1816, at the sum of £35,000.

These sculptures adorned certain buildings on the Acropolis of Athens; the chief portions, which are from the Parthenon or temple of Minerva, were designed by Phidias, and executed by him, or under his superintendence. They consist of—1. Portions of several of the statues that were placed in the e. and w. tympana or pediments, the most important of which are the Theseus or Hercules, Ilissus or river-god, upper portions of the torsos of Neptune and Minerva, Iris, torso of Cecrops, Ceres, and Proserpine, the Fates, heads of the horses of Hyperion, and one of the horses of Night. Of all these, the Theseus, and the head of the horse of Night, are the most perfect, the former wanting only the hands and feet and part of the nose, while even the surface of the latter is

very little injured. But however mutilated, the greatness in style of these magnificent works is clearly manifest, and from the merest fragment valuable instruction in art may be obtained. 2. Fifteen metopes, executed in high relief, representing the battle of the Centaurs and Lapithæ. A metope is the interval betweent he triglyphs on a Doric frieze—in the Parthenon there were 92, 14 on each front, and 32 on each flank of the temple—and on every metope, a Centaur engaged in conflict with one of the Lapithæ is represented in a style of the highest excellence in point of spirit and truthfulness. 3. A large portion of the frieze of the outer walls of the cella. This remarkable work represents the solemn procession to the temple of Minerva during the Panathenic festival, and has never been equaled for elegance of composition and the variety and gracefulness of the figures. It is executed in low relief, in order to adapt it to the light, for placed within the colonnade, it received its light between the columns, and by reflection, from the pavement below. This exquisite frieze occupied, slab after slab, a space of 524 ft. in length. The remains of it in the British museum on slabs and fragments of marble are to the extent of upwards of 249 ft., besides 76 ft. in plaster casts.

Although the Elgin marbles are now acknowledged to be the most precious collection existing of specimens of Greek art in its purest state, yet it was only after very considerable hesitation that government consented to purchase them, and then the sum awarded was not only far short of anything like a fair value, if indeed a value could be put on such treasures, but lord Elgin was left largely out of pocket after all his exertions. Again, from petty jealousy, some of the connoisseurs of the day, who had earned a sort of reputation from their collections—of whom Mr. Payne Knight may stand for the type—made strong efforts to underrate these great works; while others, like lord Byron, from feelings apparently generous, but quite mistaken, because not based on fact, heaped obloquy on lord Elgin, and opposed their acquisition. But it has been clearly proved that lord Elgin, so far from destroying, has saved these masterpieces from destruction. It was not to be expected but that foreigners would grudge this country such an acquisition, but certainly it is remarkable that such opinions should have been expressed in this country. The view adopted by a foreigner, who has devoted much attention to the subject, M. Viardot, author of *Les Musées d'Europe*, may be accepted as that generally taken abroad; and it is very different from that at one time so pertinaciously maintained by many in this country. M. Viardot remarks: "It is said that, to justify the appropriation of the Lahore diamond, the English allege that if they have taken it, it was merely to prevent its appropriation by others. They may give the same excuse for their appropriation of the marbles of the Parthenon. No doubt, lord Elgin has carried them off; and the Greeks of the present day, seeing the old temple of their Acropolis despoiled of all its ornaments, have a good right to curse the spoiler. But when we think of the devastation these works have so often experienced, the total destruction of the principal statues, and the shameful mutilation of the others, and the risk these last ran of being entirely destroyed in their turn—when we consider that these precious relics of art are conserved in a place of surety, and placed in the center of artistic Europe, one loses the desire and almost the right to charge the English with piracy and robbery. For my part, if, in the course of my long devotion to the marbles of Phidias, a regret has come to trouble the ardent pleasure of my admiration, it was, that the robber of these marbles was not a Frenchman, and their resting-place the museum of Paris.' —*Visconti on the Sculptures in the Collection of the Earl of Elgin* (John Murray, London, 1816), *Library of Entertaining Knowledge—British Museum*, (London, Charles Knight).

ELGINSHIRE, MO'RAYSHIRE, or MURRAYSHIRE, a maritime co. in the n.e. of Scotland, on the Moray firth. It contains 531 sq.m., and is 30 m. long and 20 m. broad. About a third part was formerly cut off on the s. by a detached part of Inverness-shire; but by an act of parliament, passed in 1870, this part was annexed to Inverness-shire, and a part of the intervening portion of Inverness-shire, of about the same extent, rental, and population, was annexed to Elginshire. In the s. are the high and rugged Monadhliadh mountains of Inverness-shire, dividing the basins of the Spey and Findhorn, and forking in the n. to include the basin of the Lossie. In the s., gneiss predominates, with a little granite; and in the n., sandstone with fish and reptilian remains, and small patches of oolitic and Wealden strata. West of the Findhorn mouth are the sand-dunes of Culbin, 3 sq.m. in extent, some of them rising 118 feet. Great masses of peat and trunks of trees are often cast ashore near the mouth of the Findhorn. The climate is mild and dry, and the co. has been called the Devonshire of Scotland, the mountains of Aberdeenshire and Banffshire protecting it from the cold moist winds of the German ocean. The soil is open, sandy, and gravelly, and very fertile in the n., with some deep loams and clays. In 1878, nearly a third of the co.—104,274 acres—was under crop, the chief crops being oats, barley, and turnips. Pop. '71, 43,612, chiefly agriculturists. The chief exports are grain, cattle, salmon, and timber. There are some manufactures of woolens and malt liquors. E. unites with Nairnshire in sending one member to parliament. It contains 14 entire parishes, and 8 parts of parishes. In 1871, 84.87 per cent of children, from 5 to 13 years, were receiving education. The total valuation of E., including the burghs of Elgin and Forres, was, for 1877-78, £223,279; this includes railways. The ancient province of Moray

included the counties of Elgin and Nairn, and parts of those of Inverness and Banff. Scandinavians early settled in it. About 1160, Malcolm IV. subdued it. The chief antiquities are Elgin cathedral, Spynie castle, Duffus castle, Pluscarden abbey, Kinloss abbey, and the Norman parish church of Birnie. Burghead, on the coast, is supposed by many to have been a Roman station, but its ramparts and ditches, now almost destroyed, were probably of more recent origin. It was the last stronghold of the Norsemen in this part of Scotland. E. was overrun in the civil wars of Montrose, 1645, etc.

ELI, the high-priest of Israel in the latter part of the period during which the ark of the covenant remained at Shiloh. That he was of the family of Ithamar, the youngest son of Aaron, is shown by comparing several passages of Scripture. He was probably the first high-priest in that branch of Aaron's family. His sons having died before him, the office passed to his grandson, Ahitub, and continued in his family until Solomon removed Abiathar and made Zadoc, a descendant of Eleazar, high-priest. Eli was also judge over Israel for a period of 40 years, beginning, probably, soon after the death of Samson, and extending to his own death. If his languid reproofs of the wickedness of his sons were fair specimens of his general administration, he must have been a very inefficient magistrate. The divine judgment came at length on his house for the iniquity which he knew was practiced but did not strive to arrest. His sons made themselves vile, and he restrained them not. The sentence against them, pronounced first by a prophet and afterwards by the child Samuel, was executed in a battle with the Philistines, during which the ark of God was taken and the dissolute priests were slain. When Eli, then 98 years old, heard the news, he fell backward from his seat and died.

ELIA. See LAMB, CHARLES, *ante*.

ELI'AS, ST., a lofty mountain which occupies a conspicuous position on the n.w. coast of America, in lat. 60° 18′ n., and in long. 140° 30′ west. It rises about 17,860 ft., or almost 3½ m. above the sea, being visible to mariners at a distance of 50 leagues. Physically, it marks pretty nearly the point where the shore, after trending in a n.w. direction, turns due w., and politically it divides itself between the United States territory of Alaska and the Dominion of Canada.

ELIAS LEVITA, 1472–1549; b. Bavaria; the most distinguished Hebraist of his time. Banished because he was a Jew, he went to Italy early in the 16th c., taught Hebrew at Venice and Padua, and lectured and wrote on Hebrew grammar. In 1512, he went to Rome, where he was so friendly with high dignitaries of the church, that he was accused of apostasy. His latest years were spent in Venice. He was the author of many works, of which the most valuable are those in Hebrew philology.

ÉLIE DE BEAUMONT, JEAN BAPTISTE ARMAND LOUIS LÉONCE; 1798–1874; b. France; professor of geology in the Paris school of mines; in 1833, engineer in chief of the mines of France; senator of France in 1852, and on the death of Arago chosen perpetual secretary of the academy of sciences. His best service to science was in connection with the geological map of France, on which he was employed for 18 years.

ELI'JAH (in the Greek form, occurring in the New Testament, Elias), the greatest of the prophets of Israel, was born at Tishbe, in Gilead, on the borders of the desert. He comes upon the scene in the time of Ahab, about 920 B.C. When that monarch, to please his Phœnician wife Jezebel, had introduced, on an extensive scale, the worship of Baal, E. pronounced a curse on the *land*. The prophet had to flee. He took refuge by the brook Cherith, probably one of the torrents that cleave the high table-land of his native region. Here he was miraculously fed by ravens. He then went to Zarephath, a town lying between Tyre and Sidon. Here he lodged with a widow woman, prolonged her oil and meal, and brought back her son to health from the brink of the grave. Subsequently, he made a temporary reconciliation with Ahab, and on Mt. Carmel executed dreadful vengeance on the prophets of Baal, slaying 400 with his own hand. Such a deed enraged Jezebel to the utmost. She swore to destroy the prophet, who once more took refuge in flight. He rested not till he reached Beersheba in the far south, on the edge of the desert that leads down to Sinai. The brief allusion in Scripture to his weary wanderings is very touching. At last he comes to Horeb, where he has an interview with Jehovah. The passage in which this is recorded is one of the grandest and most significant in the whole of the Old Testament. He then receives certain instructions from Jehovah, among others that he should select Elisha to be prophet in his room. E.'s next appearance is when Ahab rides forth to take possession of Naboth's vineyard: he denounces the murderous monarch, and utters an awful prophetic curse on him and his wife. After the death of Ahab, he rebukes the idolatries of his son Ahaziah in a solemn and bloody fashion; and after the death of Ahaziah, we find him interfering in the affairs of the king of Judah, who had married a daughter of Ahab, and had begun to "walk in the ways of the kings of Israel." He denounced his evil doings, and predicted his death. The closing scene of his life on earth is exquisitely narrated. A chariot of fire and horses of fire appeared after Elisha and he had crossed the Jordan, and "Elijah went up by a whirlwind into heaven."

ELIMINA'TION is a process by which, where we have a number of statements concerning several quantities, we can obtain a separate statement concerning each. Thus, in algebra, elimination is the operation which consists in getting rid of a quantity or letter which is common, say, to two equations, by forming out of the two a new equation, in such a way as to make the quantity in question disappear. If three unknown quantities, for instance, are to be found from three independent equations, the first step is to form out of the three given equations two new equations, so as to eliminate one of the unknown quantities; from these two equations another of the quantities is eliminated in the same way, giving one equation with one unknown quantity, the value of which is then found. In complicated equations, elimination becomes difficult, and often impossible. Elimination is an important process in other sorts of reasoning besides the mathematical; in this larger acceptation, it means the setting aside of all extraneous considerations—of everything not essential to the result. In astronomical observations, the elimination of errors of observation is often effected by repeating the observations several times in such a way as to cause the errors to be of opposites kinds, then adding the observed values, and taking their average.—The word to "eliminate" is often erroneously used in the sense of, to "elicit," or bring to light.

ELIOT, CHARLES WILLIAM, LL.D., b. Boston, 1834; a graduate of Harvard, and tutor of mathematics in that institution. In 1858, he became interested in chemistry, and went to Europe to study that branch of science. In 1865, he was appointed professor of chemistry and metallurgy in the Massachusetts institute of technology; in 1869, he succeeded Thomas Hill as president of Harvard university. His father, SAMUEL ATKINS ELIOT, was the author of a history of Harvard, and for nearly a dozen years treasurer of the college. Dr. E. has led in the introduction of extensive changes in the course of study and the administration of his college, tending towards the style of the European universities.

ELIOT, GEORGE. See EVANS, MARIAN.

ELIOT, JARED, 1685-1763; b. Conn.; grandson of the "apostle to the Indians," preacher, agriculturist, and botanist; also eminent as a physician. He brought the white mulberry-tree to Connecticut. Among his works were *Agricultural Essays*, and *Religion Supported by Reason and Revelation*.

ELIOT, Sir JOHN, 1592-1632; an English statesman, b. at his father's seat on the river Tamar. He graduated at Oxford, studied law, and traveled on the continent, for part of the time with George Villiers, afterwards duke of Buckingham. At the age of 22, he entered parliament, and at 27, was made vice-admiral of Devon, in which office he captured the famous Nutt, a pirate whose depredations were a constant infliction upon the commerce on the southern coast. But by corrupt influences at court, Nutt was released to continue his depredations, while E. was imprisoned, on false charges, in the Marshalsea for about four months. Immediately upon his release, in 1624, he was returned to parliament, where, during the first three parliaments of Charles I., with Pym, Hampden, Selden, and Coke, E. was the foremost leader in resistance to the encroachments of the crown, surpassing all the great statesmen of his time in his symmetrical union of learning, genius, and lofty devotion, with absolute personal bravery and the fire of oratory. He spoke out boldly against the lawlessness and venality of the ministry, and the weak, ill-tempered foreign policy of Buckingham, and urged parliament to withhold supplies until an account was given of the money already voted. For comparing Buckingham to Sejanus, he was imprisoned in the Tower in 1626; but the commons compelled his release, and exonerated him by special vote. He suffered another short imprisonment for petitioning the king against forced loans, and later received sentence of outlawry. These persecutions only increased his popularity, and though earnestly opposed by the court, he was again returned to parliament in 1628. He took part in drawing up the petition of right, and, on the last day of that parliament, read a protest against tonnage and poundage and other taxes unauthorized by parliament; and against the king's illegal encouragement of Arminians and Roman Catholics. Being summoned before the council, with Holles, Selden, Valentine, and others, he refused to answer for his acts in parliament except to parliament itself. He was then rigorously confined in the Tower, with his fellow-members, for more than two months, until manifestations of popular indignation compelled the king to bring him to trial. During tedious delays his confinement was somewhat softened; he occupied himself in writing a personal defense, and other works; and in Feb., 1631, sentence was at last given. All the prisoners were condemned to a fine, the largest, of £2,000, being imposed upon E.; to imprisonment during the king's pleasure; and not to be released until they had given security for good behavior, submitted to the king, and acknowledged their offenses. The confinement of the others was gradually relaxed, until they were all released, but E. would make no submission. Dec. 21, 1631, more than a year after his arrest, the council resolved to force him to submission. They removed him to a cold, unwholesome room, and forbade any one except his sons to visit him. His health broke down, and with medical advice he petitioned the king, in simple, manly words, for such release as health demanded. His petition was refused as not sufficiently humble. In a second petition he declared himself "heartily sorry that he had displeased his majesty," but added no words acknowledging wrong. He was denied an answer. He

had now been prisoner two years, and though only forty years old, was worn out with cruel confinement. He died two weeks after the king refused his last petition. Charles even refused permission to his sons to bury him in the family tomb, and ordered that he should be buried in the church of the parish where he died. During the commonwealth his sentence of conviction was reversed by act of parliament.

ELIOT, JOHN, 1604–90; "the apostle of the Indians;" b. at Nasing, Essex, Eng. He graduated at Cambridge in 1623, and entering the non-conformist ministry, emigrated in 1631 to Boston, Mass., where he officiated for a year in the church of Mr. Wilson, who was then in England, and, in 1632, he was settled over the church in Roxbury. He soon began preaching to the Indians, acquiring their language by the help of a young Pequot, taken prisoner in 1637. He translated the commandments, the Lord's prayer, and many texts, and first preached without an interpreter in 1646, at Nonantum, now Brighton, on the border of Newton. A settlement of Christian Indians was established, and a missionary society was organized in England, of which Robert Boyle was a leading member. This society sent Eliot £50 per annum to supplement his salary of £60 at Roxbury. In 1651, the settlement was removed to Natick, where an Indian church was formed in 1660. In 1653, E. published a catechism for their use, said to have been the first work published in the Indian language: no copy is known to exist. In the same year accounts of Eliot's labors were published by the corporation in London, and in 1655, a tract containing the doctrinal and experimental confession of these Indians who had been baptized and admitted to church fellowship. In 1660, E. published in London *The Christian Commonwealth, or the Civil Policy of the rising Kingdom of Jesus Christ*, which was criticised as containing seditious principles. The governor and council of Massachusetts required him to retract some of its utterances. About this time he completed his great work, the translation of the Bible into the Indian tongue. The New Testament was published at Cambridge, Mass., in 1661, the Old in 1663. A second edition of the New Testament was printed in 1680, and of the Old in 1685. Both of these editions are now very rare; the language in which it was written has ceased to be spoken, and only one or two persons in recent times are able to read it. E. was assisted in the translation by the Rev. John Cotton, of Plymouth, Mass. A new edition was printed at Boston, 1822. E. published many other works in the Indian and in the English tongue. His well-known *Indian Grammar Begun*, printed at Cambridge, Mass., 1666 (reprinted 1822), has at the end these memorable words: "Prayers and pains, through faith in Jesus Christ, will do anything." Of his *Indian Primer* (1669), the only complete copy known to exist is preserved in the library of the university of Edinburgh. It was reprinted, 1877. In 1671, E. printed in English, at Cambridge, *Indian Dialogues, etc.;* and in 1672, *The Logick Primer*. Of the former the only known copy is in a private library in New York; of the latter work there is a copy in the British museum, and another in the Bodleian library. Even in his old age the pen of E. was not idle. He died at Roxbury, Mass., at the age of 86, having won all hearts by his simplicity of life and manners, and his evangelical sweetness of temper, whether in the villages of the English colonists, or in the huts and wigwams of the Indians. His Indian publications are still of value for the light which they throw upon the structure and character of unwritten dialects.

ELIOT, SAMUEL, LL.D., b. Boston, 1821; graduated at Harvard, and traveled in Europe four years. He became professor of history and political science in Trinity college, Hartford, in 1856, and was president from 1860 to 1866; and in 1874, professor of political science and constitutional law in the same institution. He has published *Passages from the History of Liberty*, 1847, in which he traced the careers of Savonarola and other reformers, a work afterwards enlarged under the title *The Liberty of Rome*, 1849, and republished, with additional volumes, as *The History of Liberty*, 1853. He also published a *Manual of United States History*, 1856.

ELIOTT, or ELLIOT, GEORGE AUGUSTUS. See HEATHFIELD, LORD.

ELIS, one of the ancient divisions of the Peloponnesus, bounded n. and n.e. by Achaia, e. and s. by Arcadia, and w. by the Ionian sea. It was originally divided into three districts—Cœle or Hollow Elis, Pisatis, and Triphylia. Of these, the first-named was by far the largest and most valuable, comprising as it did the broad and fertile plains watered by the Peneus and the Ladon, and producing excellent crops of corn, cotton, and flax; while the pastures by the river-banks reared cattle and horses of proverbial excellence. This district, from its fertility, was called "the milk-cow of the Morea." Pisatis is drained by the Alpheus, and is separated from Cœle Elis by Mt. Pholoë, a spur of Erymanthus. The low grounds of this division possess great natural fertility. Most of the surface of Triphylia is hilly, being occupied with offshoots from the great Arcadian ranges. It is separated from Pisatis by the Alpheus, on whose banks were the grove and temple of Olympic Jove, and the plain in which the great Olympic games were celebrated. Though E. had few facilities for preventing invasion, it yet suffered less from war than any other of the Greek states—an advantage chiefly due to the sacred character of the country, as the seat of the greatest of the national festivals. Their prerogative of holding the Olympic games gave the Eleans a prestige which they continued to enjoy in greater or less degree till the games themselves were suppressed by the emperor Theodosius in 394 A.D.—ELIS, now *Kaloscopi*, the capital of the fore-

going country, stood on the Peneus, and was long famous as one of the most splendid and populous cities of Greece. It was at one time strongly fortified, and contained many magnificent buildings, conspicuous among which was the gymnasium, in which it was necessary that all athletes intending to take part in the Olympic games should go through a month's training before they were allowed to compete. See Leake's *Morea*, and Curtius' *Peloponnesus*.

ELI'SHA, a prophet of Israel, the successor of Elijah, who found him at the plow, and consecrated him to the sacred office by throwing his mantle over his shoulders. He exercised his functions for a period of 55 years. When Elijah was carried up into heaven, E. returned to Jericho, where he dwelt for some time. He then proceeded to Bethel, where the perplexing miracle occurred of the destruction of the 42 children by the two she-bears. After this period, he seems, besides performing an extraordinary number of miracles, to have taken an active part in the religious politics of his country, but he exhibited nothing of the fiery and sanguinary zeal of his master. Mild, tolerant, conciliatory, we hardly ever, if at all, find him rebuking the Baal-worship that was still prevalent in Israel. Many of the incidents in his history recall the creations of eastern fancy, such, for example, as those of the horses and chariots of fire round about E. on the hillside, of the smiting of the Syrian host with blindness, so that the prophet led them all unconsciously into Samaria, captive, etc. With Elijah, it has been said (see Smith's *Dictionary of the Bible:* art. "Elisha"), the miracles are "introduced as means towards great ends, and are kept in the most complete subordination thereto. But with E., as he is pictured in the Hebrew narrative, the case is completely reversed; with him, the miracles are everything, the prophet's work nothing. The man who was for years the intimate companion of Elijah, on whom Elijah's mantle descended, and who was gifted with a double portion of his spirit, appears in the Old Testament chiefly as a worker of prodigies, a predicter of future events, a revealer of secrets, and things happening out of sight or at a distance." The difficulties that thus beset the literal acceptance of the narrative of E.'s miracles have been felt by most modern commentators, and to evade these difficulties various methods, more or less satisfactory, have been employed. For several years E. was the chief theocratical counselor of Jehoram. Under the reign of Jehu and his successors, he gradually withdrew from public affairs, and died in Samaria in the reign of Jehoash, grandson of Jehu (about 840 B.C.). It has been customary to draw a parallel between E. and Christ; and his mildness and gentleness—always excepting the story of the destruction of the children at Bethel, which has perplexed all humane readers of Scripture—seem to justify this. E. is canonized in the Greek church; his day is the 14th of June.

ELIX'IR (Lat. *elixare*, to extract by boiling), a term in pharmacy, which has come down from the days of alchemy, and is applied to various preparations, consisting mostly of solutions of aromatic and bitter vegetable substances in spirits of wine. The term tincture is now more common. ELIXIR OF VITRIOL, or aromatic sulphuric acid, is prepared from 1½ fluid ozs. of sulphuric acid (oil of vitriol), 10 fluid ozs. of rectified spirit, ½ oz. cinnamon in powder, 1 oz. ginger in powder. The acid is gradually added to the spirit, and the mixture being placed in a closed vessel, is allowed to digest at a gentle heat for three days; the cinnamon and ginger are then added, and after being allowed to stand about six days, the whole is strained through cloth. The elixir of vitriol is useful for quenching thirst, sharpening the appetite, checking profuse perspiration, and often reducing the action of the pulse. The dose may range from 10 to 40 minims, and is administered in a wine-glassful of water, or some mild liquid, as infusion or conserve of roses.—ELIXIR VITÆ OF MATHIOLUS is composed of alcohol, and upwards of twenty aromatic and stimulating substances, and was at one time administered to patients suffering from epilepsy.

ELIZABETGRAD, a t. of South Russia, is situated in the midst of a delightful plain, on the banks of the Ingul, in lat. 48° 27′ n., long. 32° 15′ e., about 130 m. n. from Kherson. It consists of a town proper and four suburbs, is well built, its streets straight, wide, and adorned with avenues of trees. E. has a large arsenal within the walls, and is protected by six bastions. A considerable trade is carried on here in the produce of the surrounding districts; and an annual fair is held, which is attended by many thousands of dealers; commerce is also carried on with Poland and Moldavia. In the immediate neighborhood of the town there are upwards of 30 wind-mills. Great numbers of cavalry are always present in E., as it is the head-quarters of the military colonies e. of the river Bug. Pop. '67, 31,968.

ELIZABETH, a city and seat of justice in Union co., N. J., on Newark bay and Staten Island sound, 12 m. s.w. of New York; on slightly elevated ground on both sides of the Elizabeth river; reached by the New Jersey Central and the Pennsylvania railroads. It was settled under the name of Elizabethtown in 1665, and was the colonial capital from 1755 to 1757. It is well laid out with broad and well-shaded streets, and contains several small parks and many handsome residences. It is the home of a large number of men who do business in New York and travel to and fro daily upon one or the other of the railroads which meet and cross each other near the center of the city. The port is accessible for vessels of 300 tons, and receives large quantities of coal and iron brought by rail from the Pennsylvania mines for transhipment. A line of steam-

boats plies daily between Elizabethport and New York; a private company supplies the city with water from Elizabeth river; the streets are lighted with gas and paved. The property of the city was assessed in 1873 at $15,563,625—probably not more than one third of its real value. Among the public institutions are an almshouse, orphan asylum, and old ladies' home. The schools, having an average attendance of from 2,500 to 3,000 children, are well cared for. The amount appropriated for their support in 1873 was $32,000. There is a business college and a collegiate school for young men, besides several private schools. There are 24 churches, the denominations represented being Presbyterian, Roman Catholic, German Moravian, Baptist, Methodist, Episcopal, Congregational, and German Lutheran. The periodicals are three daily, one semi-weekly, and one monthly. The principal manufactories are of sewing-machines, cordage, edge tools, gas machinery, boots and shoes, carriages, zinc, combs, pottery, trunks, stoves, saws and hats. There also several foundries, breweries, and planing-mills. There are two national banks, with a total capital of $600,000, 3 savings-banks, and several insurance companies. The city is at present in a state of financial embarrassment on account of debts incurred for public improvements of a speculative character. Pop. in '70, 20,832, of whom 6,752 were of foreign birth.

ELIZ'ABETH, Queen of England, was the daughter of Henry VIII. and the unfortunate Anne Boleyn, and was b. 7th Sept., 1533. While she was yet in her third year, her mother was beheaded. After her mother's execution, she was sent to the country, where, in comparative poverty and seclusion, under the care of ladies who leaned to the "new learning," and sometimes, though seldom, with the companionship of her brother Edward, or her sister Mary, the greater part of her early youth was spent. When Catharine Parr became queen, E., who was a favorite with her, was more seen at court; but from some unknown cause, she incurred her father's displeasure, and was again sent to the country. Her father died when she was 13 years old. During the reign of her brother Edward, her life passed quietly and peacefully. She was then remarkable for a great demureness and sobriety of manner, discoursing with her elders with all the gravity of advanced years. Edward used to speak of her as his "sweet sister Temperance." During her sister's reign, this demureness was exaggerated into prudery, and the vanity which, in after years, with ampler means at its command, displayed itself in the utmost profusion of personal decoration, then sought for distinction by excess of plainness. Her Protestantism, and the way in which court was paid to her by the Protestant nobility, caused uneasiness to Mary and her council. On her sister's command, she conformed to papacy, but the insincerity of the conformity imposed upon no one. Upon the pretext of having been concerned in Wyatt's rebellion, she was sent in 1554 to the Tower. She entered it with all the gloomy forebodings which the fate of so many royal ladies who had been recently within its walls, could suggest. In daily fear for her life, many months passed. Indeed, the warrant for her execution was at one time prepared; and it is unquestionable that the stern bigotry of Mary and her councilors, Gardiner and Bonner, would have sacrificed E., but for the fear of popular commotion. The people, however, regarded E. with great favor, and many already looked forward to the time when the death of Mary should free the court from foreign influence, and give room for a milder government. Thus the life of E. was saved, but for some time longer she was kept a prisoner at Woodstock. During the remainder of Mary's reign, E., though occasionally at court, resided chiefly at her residence of Hatfield house, in Hertfordshire, where she occupied herself with feminine amusements, and the study of classical literature, under the learned Roger Ascham.

When Mary died (17th Nov., 1558), E. was 25 years of age. Her accession was welcomed alike by Catholic and Protestant. The former were, outwardly at least, the majority in Mary's reign; but among them were few who really cared for the peculiar doctrines of the Roman church, and there were many who were weary of priestly interference, foreign dictation, and cruel persecution. Like E. herself, there were many who had conformed merely to save themselves from trouble. They had obeyed the Six Articles in Henry's time; had agreed to the Protestant settlement of Edward; had turned with queen Mary, and were now ready to turn again with queen Elizabeth. The Protestants, of course, who had never believed the sincerity of E.'s conformity, welcomed her to the throne. E. then began, amidst dangers and difficulties, a reign which, contrary to the expectation of all, was of unexampled length and prosperity. It would be wrong not to attribute to her influence some effect in producing the great changes which, during the next 44 years, took place in England; but so far as these changes were not produced in the natural course of the development of the nation's powers, and so far as they bear the mark of an individual mind, they bear much more the impress of the bold yet cautious judgment and clear intellect of the great minister, Cecil, than of the sovereign's will. It is to the highest praise of E. that her first act on succeeding was to consult with such a man, and that to the very last she could bend her capricious temper to his control.

How the government influence was to be directed, was not long in being shown. Till parliament should meet, E. issued a proclamation that the English language should be used in the greater part of the church service, and that the host should not be elevated by the priest during mass. This sufficiently indicated into what hands power

had passed, and was enough to throw the mass of the indifferent to the side of the Protestants, and to cause a Protestant majority to be returned to E.'s first parliament. The acts of this parliament must be ever memorable in our history. It was then that England took its position as a Protestant power. The Book of Common Prayer, retaining, doubtless, some mixture of mediæval thought, but still vivid with new energy, was appointed to be used in all churches; the Thirty-nine Articles were settled as the national faith; the queen was declared to be head of the church. Thus all allegiance to Rome was thrown off. This revolution was soon accomplished and with little turmoil. The bishops, with one exception, refused to conform; but as a sign of the times, marking how thoroughly the priesthood must have become demoralized before their power was lost, it is noteworthy that of the 9,000 clergymen who held livings in England, there were fewer than 200 who resigned, rather than obey the new order of things.

The policy of E.'s ministers was one of peace and economy. They found the nation at war with France and Scotland, and one of their first acts was to secure peace upon favorable terms. Ever afterwards, they followed the same path. No war was undertaken in her reign for the sake of territorial conquest. To strengthen her own throne, E. secretly succored the Protestants in Scotland, in France, and in the Low Countries; but she had few open wars. To be at peace with a government, nay, apparently to be upon the most amicable terms with it (as E. was with the French court, while she sent assistance to the Huguenots at Rochelle), and at the same time to aid its rebellious subjects, was in those days thought only part of the politic dissimulation, without which, it was believed, no nation could be safely ruled. To maintain the security of her own throne, and to prevent foreign interference in English matters, was the mainspring of E.'s foreign policy; and she lost no opportunity of weakening and finding occupation abroad for any foreign power that unduly threatened her authority.

The one great blunder of England's policy was the treatment of Mary Queen of Scots. Had E. pursued a straightforward course, when her rival was thrown into her hands, much evil might have been spared. Some of the English ministers were prepared to take effectual measures to remove a life which might be turned into so dangerous a tool in the hands of Catholics. E. shrank from that course, but had not the courage and generosity to set queen Mary at liberty. Had this course been taken, Mary would have gone to France or Spain, would have made a foreign marriage, and as a foreigner would have lost the only sources of her real power—the sympathies of the Scotch and English Catholics. As it was, E. retained her a prisoner, and thus for years gave cause to conspiracy after conspiracy among the English Catholics. For a rebellion incited to set Mary free, the richest and most popular of the English nobility, Norfolk, was executed. The discovery of every new plot led to demands, on the part of parliament, for the execution of Mary. The plots then took a graver aspect. The assassination of E., and the placing of Mary on her throne, became the object. On the discovery of Babington's conspiracy for this purpose, the popular cry was irresistible, and was joined in by Cecil and Walsingham, and others of E.'s ministers, who had sinned too deeply against Mary to run the risk of her succession to the throne. With reluctance and hesitation, the sincerity of which need not be questioned, E. consented; and Mary, after long years of confinement, was condemned and executed.

This led to new evils. The participation of the Catholic party in the plots was retaliated by persecution. Many suffered under an act passed in 1585, making it treason for a Catholic priest to be in England, and felony to harbor one. These cruel measures were the ultimate means of bringing upon England the most menacing foreign attack which she had suffered. Philip of Spain had long meditated vengeance against England. The greatest state in Europe, enriched by splendid acquisitions in the new world, could ill brook that a power of the second rank should incite rebellion among her subjects in the Netherlands, should aid the Protestants in their desperate struggle against Alva, and allow its ships (little better than pirates, it must be confessed) to enter the Spanish harbors, and cut out the rich laden galloons. These were the real reasons: to restore the Catholic faith, and to revenge the death of a Catholic queen, furnished ostensible reasons. Years had been spent in preparation. In 1588, the "invincible armada" sailed from the Tagus, manned by 8,000 sailors, and carrying 20,000 soldiers. To aid these, a land-army of 100,000 men was to be transported from the Netherlands under the duke of Parma. The news roused all England, and every man who could carry arms—Protestant and Catholic from 18 years of age to 60—was enrolled in the forces. The old queen herself rode at Tilbury, energetically encouraging the army. A fleet of 200 vessels and 15,000 seamen gathered itself on the southern coasts, and waited the attack. Superior skill and courage gained the victory for the English; and what these had begun, the force of the elements completed. The splendid armada was broken and destroyed before it could join the land-army, not a soldier of which ever left foreign ground; while not a seaman of the fleet, save those whom shipwrecks sent, ever set foot on English ground.

E. died on 24th Mar., 1603, having lived nearly 70, and reigned nearly 45 years. If the life of her rival, Mary of Scotland, read somewhat like a tragedy, the private life of E. might afford abundant materials for comedy. Always parading her wish to live an unmarried life, E. coquetted with suitor after suitor till long after that period of life

when such proposals verge upon the ridiculous. Of her father's schemes to marry her to the Scotch earl of Arran or to Philip the son of Charles V.—afterwards husband of Mary—it is unnecessary to speak, for E. had personally little to say in regard to them. But she was scarcely more than a child when her flirtations with the handsome lord admiral Seymour—the brother of the protector Somerset—had passed the bounds of decorum. In Mary's reign, E. was flattered with the attentions of her kinsman, the earl of Courtenay, and she declined the hand of Philibert of Savoy, pressed on her by her sister's council. When queen, with some hesitation she refused the offer of Philip II., who was desirous of perpetuating his influence over England, and she began that connection with Leicester, which so seriously compromised her character. It is certain that she loaded him with honors as soon as she had them to bestow; allowed him to become a suitor for her hand within a few days after the sudden death of his wife, Amy Robsart, attributed by all England to his agency; and allowed him to remain a suitor long after his open profligacy had disgusted the nation, and had even opened her own eyes to his worthlessness. If we credit the scandal of the times, the intimacy was of the most discreditable kind. If we credit those sources of information, recently turned to more profit by Mr. Froude than by any of his predecessors, which are found in the dispatches of the bishop of Aquila, ambassador of Philip II. in London, preserved in the archives of Simancas, not only was the moral character of E. sullied with the darkest crimes, but even the quality for which she has ever been most honored, her English patriotism, was mere affectation. These dispatches represent her as accessory —at least, after the fact—to the murder of Amy Robsart, and as offering to Spain to become a Catholic, and to restore the Spanish ascendency in England, if Philip would support her on the throne as the wife of Leicester; and they represent her as being restrained from giving way to the fatal consequences of her wild passion only by Cecil's control. That there is some basis of truth in this revelation, it is scarcely possible to deny; but the hatred with which Philip regarded E. after her refusal to marry him, has undoubtedly led the courtly bishop to gross exaggerations. It is undeniable, however, that had E. followed her own inclinations, she would have married Leicester. Her ministers, wisely for the nation, prevented this, but E. never seriously entertained another proposal. Cecil could prevent her marrying whom he would not, but he could not force her to marry whom he would. Among less distinguished suitors, the archduke Charles of Vienna, and prince Eric of Sweden, pressed their suit in vain. Petitions from parliament to the queen to marry, only excited her maidenly wrath, and produced dignified replies that she would attend to the matter when the time came. Years passed on, and she remained a spinster. Catharine of Medici, queen-mother of France, intrigued to marry her to one of her sons, Henry of Anjou (afterwards Henry III.), or the duke of Alençon, afterwards duke of Anjou. When the foreign envoys pressed the suit of the latter, E. was 38 years of age, and her suitor 19; but they ingeniously flattered her that she and he looked of the same age, for she, by her good preservation, looked nine years younger than she was; while the duke, by his wisdom, gravity, and mature intellect, looked nine years older. This flattery, with more plausible attractions, was without effect.

E.'s position gave too much scope for the development of the unamiable and ridiculous features of her character. The personal vanity displayed in her extravagant dress, her conversation, her "high and disposed" dancing, excites a smile, not lessened when we read of the irritable mistress boxing the ears of her councilors, cuffing her attendants, indulging in expressive masculine oaths, and amusing herself with rough masculine sports. The assertion that she was of a cruel disposition is false. That she could do cruel things when her vanity was concerned is sufficiently attested by her ordering the right hand of a barrister, named Stubbes, to be struck off for writing a remonstrance against her marriage with the duke of Alençon, which she thought unduly reflected on herself; but in her reign, the reckless waste of human life which marked the reigns of her predecessors was unknown. She was not, however, of fine feelings. Her brother could compliment her on the calm mind and elegant sentences with which she replied to the communication of the death of her father. On the news of her sister's death, she burst out with rhapsodical quotations from the Psalms; and when she heard of the execution of her lover Seymour, she turned away the subject with something like a jest. By her attendants, she was more feared than loved. The one quality which never failed her, was personal courage; and when she chose, her demeanor was stately and royal. Religion was with her, as with a great proportion of the nation at that time, a matter more of policy and convenience than of feeling or principle. She preferred Protestantism, from early associations, because it gave her the headship of the church, freed her from foreign interference, and was more acceptable to her ministers and to the nation. But she had conformed in Mary's time to Catholicism with little difficulty; and, had there been necessity for it, she would rather have reigned a Catholic than not have reigned at all. To the last, she retained in her private chapel much of the ritualism of the Roman church; and while refusing her Catholic subjects the exercise of their religion, she entertained the addresses of Catholic suitors. How thoroughly incapable she was of appreciating a matter of religious principle may be gathered from the fact, that she looked upon the great Puritan movement, destined soon afterwards to play so impor-

tant a part in the nation's development, as some frivolous controversy about the shape of clerical vestments. Of toleration, then well enough understood by Bacon and the more advanced spirits of the age, she had no conception.

What makes the name of E. so famous, was the splendor of her times. In her long reign, the true greatness of England began. Freed from the possession of those French provinces which rather harassed than enriched—with little domestic commotion—with no great foreign wars—with an almost complete immunity from religious persecution, the nation turned to the arts of peace. An unequaled literature arose. The age that produced Spenser, Shakespeare, and Bacon could not be other than famous. Under Frobisher and Drake, maritime adventure began, and the foundations of our naval force were laid. Commerce, from being a small matter in the hands of a few foreign merchants, developed itself largely. The exchange of London was opened in E.'s time; and in the charter which she granted to that company of merchant adventurers, which afterwards took the name of the East India company, may be seen one of the small beginnings of our vast colonial empire. The social condition of the people also greatly improved in her reign. The crowds of vagabonds which the monastic institutions had fostered, and who had pillaged the country in all ways on the secularization of the monastic property, died out, or were absorbed in industrious employments. The last traces of bondage disappeared. Simultaneously with the growth of greater comfort and intelligence in the people, parliament began to assert, with greater vigor, its constitutional rights. The right of the commons to free speech, and to initiate all money-bills, was steadily asserted, and the right of the crown to grant monopolies, or to issue proclamations having the force of law, vigorously assailed. In the later years of her reign, the attempts of E. to gain arbitrary power, and her caprices, had forfeited the popularity which she so anxiously cultivated. But after her death, her fame revived; and during the time of the Stuarts, amid the jealousy of the Scotch, the troubles of the civil wars, and the hatred of a Catholic sovereign, the nation looked back with fond regard to the long reign of the "Good Queen Bess," when peace had prevailed, and the government had been thoroughly English.

ELIZABETH, CHRISTINA, 1715–97; Queen of Prussia, wife of Frederick the great. Although Frederick was decidedly opposed to the marriage, to which he was compelled by his father, he spoke very highly, in after years, of her high and winning character. She wrote a number of works in the French language.

ELIZABETH, SAINT, daughter of Andreas II., king of Hungary, was b. at Presburg in 1207. At the age of four, she was affianced to the landgraf of Thuringia, Louis IV., called the pious, and brought to his court to be educated under the eyes of the parents of her future husband. She early displayed what may be called a passion for the severities of the Christian life, as it was conceived in those days. She despised pomp, avarice, ambition; cultivated humility, and exhibited the most self-denying benevolence. Her conduct, even as a girl, astonished the Thuringian court; but such was the grace and sweetness of her disposition, and the excellence of her beauty, that Louis—though her affections seemed to be given wholly to God—still wished to marry her. They were united when E. was only 14. Louis himself, far from blaming the devout girl whom he had made his wife for her long prayers and ceaseless almsgiving, was himself partially attracted to a similar mode of life. A boy and two girls were the fruit of their union; but the happiness of E., in so far as it depended on anything earthly, was shattered by the death of her husband in 1227, when absent on the crusade headed by Barbarossa. Her confessor, Conrad of Marburg, a narrow fanatical monk (to whose miserable teaching E. mainly owed her perverted idea of life and duty), had trained her to stifle the emotions of her nature as sinful, and the poor widow hardly dared to bewail her loss. Great misfortunes soon befell her. She was deprived of her regency by the brother of her deceased husband, and driven out of her dominions on the plea that she wasted the treasures of the state by her charities. The inhabitants of Marburg, whose miseries she had frequently relieved, refused her an asylum, for fear of the new regent. At last she found refuge in a church, where her first duty was to thank God that he had judged her worthy to suffer. Subsequently, after other severe privations, such as being forced to take up her abode in the stable of a hostelry, she was received into the monastery of Kitzingen by the abbess, who was her aunt. When the warriors who had attended her husband in the crusade returned from the east, she gathered them round her, and recounted her sufferings. Steps were taken to restore to the unfortunate princess her sovereign rights. She declined the regency, however, and would only accept the revenues which accrued to her as landgravine. The remainder of her days were devoted to incessant devotions, almsgivings, mortifications, etc. There is something mournfully sublime in her unnatural self-sacrifice. We shudder even in our sympathy when we read of this beautiful tender-hearted creature washing the head and the feet of the scrofulous and the leprous. Murillo has a painting (now in the museum at Madrid) of this act of evangelical devotion. The solemn tragedy of her brief life assumed towards its close a ghastly intensity through the conduct of her confessor, Conrad, who, under pretense of spiritual chastisement, used to strike and maltreat her with brutal severity. The alleged cause of this was Conrad's aversion to her "squandering" her money among the poor. Perhaps he thought it should have gone

to *him*. At last her health gave way; and on the 19th Nov., 1231, at the age of 24, E. died, the victim partly of ill-usage and partly of a mistaken theory of religious life, but as gentle and saintly a soul as figures in the history of the middle ages. She was canonized four years after her death. See Montalembert's *Histoire de Sainte Elisabeth de Hongrie* (Paris, 1836). The Rev. Charles Kingsley's dramatic poem, entitled *The Saint's Tragedy* (London, 1848), is founded on the story of E.'s life.

ELIZABETHAN ARCHITECTURE, a term applied to the mixed style which sprang up on the decline of Gothic architecture. By some it is called the Tudor style, but that name belongs more correctly to the perpendicular, or latest kind of Gothic. The Elizabethan is chiefly exemplified by mansions erected for the nobility in the reigns of Elizabeth and James I., and originated in the first attempt to revive classic architecture, influenced, no doubt, by Holbein, who was patronized by Henry VIII., and furnished several designs in this manner. John of Padua succeeded him, and built in the mixed style a palace for the protector Somerset (for which purpose the cloisters of St. Paul's were taken down), and the mansion of Longleat for his secretary, sir John Thynne. The vast dimensions of the apartments, the extreme length of the galleries, and enormous square windows, are the leading characteristics of this manner of building. The ornaments both within and without were cumbrous; nothing could exceed the heaviness of the cornices and ceilings wrought into compartments; in short, the architecture was just in keeping with the dress of the period, rich and gorgeous, rather than elegant, graceful, and comfortable. The following examples of mansions of the 17th c. may be still seen near London: Holland house, Campden house; and the following in Kent: Sir T. Willow's at Chariton, the marquis of Salisbury's at Hatfield, and Knowle, the property of the duke of Dorset. The most eminent architects of those times were John Thorpe, Gerard Christmas, Rodolph Symonds, and Thomas Holt.

ELIZABETH CITY, a co. in s.e. Virginia, on James river and Chesapeake bay; 50 sq.m.; pop. '70, 8,303—5,471 colored. Corn and wheat are the staple products. Co. seat, Hampton.

ELIZABETH ISLANDS, a group s.w. of cape Cod, between Buzzard's bay and Vineyard sound, forming the town of Gosnold, Dukes co., Mass. There are 16 islands, the most important of which are Naushon, Cuttyhunk, Pasque, and Nashawena; pop. of the whole group (permanent residents) about 100. The islands have a fine climate, and afford excellent fishing. On Cuttyhunk island the foundations of the first English colony of New England were laid, in 1602, by Bartholomew Gosnold, but the place was abandoned a few weeks later. On another island, Penikese (area 100 acres), a school of natural history, connected with Harvard college, was established 1873, but discontinued in a few years.

ELIZABETH PETROV'NA, empress of Russia, daughter of Peter the great and Catharine I., was b. in the year 1709. On the death of Peter II., in 1730, she allowed Anna, duchess of Courland, to ascend the throne, she herself being apparently indifferent to anything but the indulgence of her passions. Anna died in 1740, and Ivan, the son of her niece (also called Anna), an infant of two months, was declared emperor, and his mother regent during his minority. Shortly after this, a plot was formed to place E. upon the throne; the two principal agents in it were Lestocq, a surgeon, and the marquis de la Chetardie, the French ambassador. The officers of the army were soon won over; and on the night of the 5th Dec., 1741, the regent and her husband were taken into custody, and the child Ivan conveyed to Schlüsselburg. The leading adherents of Anna were condemned to death, but pardoned on the scaffold, and exiled to Siberia. By eight o'clock in the morning, the revolution was completed, and in the afternoon all the troops did homage to the new empress. La Chetardie was handsomely rewarded; and Lestocq was created first physician to the empress, president of the college of medicine, and privy councilor. E., however, did not possess the qualities requisite in a ruler. She wanted energy, knowledge, and love of business, and allowed herself to be guided by favorites. In order to strengthen her position, E. took pains to win over her nephew, the young prince Peter, the son of her sister, the duchess of Holstein-Gottorp. She summoned him to Petersburg in the year 1742, and proclaimed him her successor. E. took part in the Austrian war of succession, and in spite of the opposition of France, dispatched an army of 37,000 men to the assistance of Maria Theresa, and thereby hastened the conclusion of the peace of Aix-la-Chapelle in 1748. E. showed herself less placable towards Frederick II., against whom she cherished a personal enmity, excited by some severe expressions he had employed respecting her. At the commencement of the seven years' war, she allied herself with Austria and France, and marched her troops into the Prussian states. Her troops gained the victory in the battles of Grossjägerndorf and Kunersdorf, and took possession of Berlin, but without any decisive result. E. died before the expiration of the war, 5th Jan., 1762. She founded the university of Moscow and the academy of art at St. Petersburg. Though no person was put to death during her reign, the most shocking punishments were inflicted, and thousands were exiled to Siberia and Kamtchatka. E. had several illegitimate children. Profligacy, espionage, and persecution reigned in her court, the administration of justice was restrained, and the finances neglected; but E. was nevertheless extremely strict in the observance of the public ordinances of religion.

ELIZABETH STUART, queen of Bohemia, remarkable not only as a heroine, but as forming the connecting link between the ancient royal families of England and Scotland and the present reigning dynasty, was b. in the palace of Falkland (q.v.) on the 19th of Aug., 1596. On the accession of her father, James VI. of Scotland, to the crown which fell to him by the demise of queen Elizabeth, in 1603, she accompanied the family to England, where she was educated. On the 14th of Feb., 1613, E. was married to Frederick, elector-palatine, whom she soon after accompanied to his residence, the castle of Heidelberg (q.v.); see also PALATINATE. When the Protestant princes of Germany sought for a fitting person to fill the throne of Bohemia, they made choice of Frederick, who accepted the perilous honor, partly, perhaps, from the ambition of his wife, who is alleged to have longed for the title of queen. The palatine removed with E. and three children to Prague, which they entered Oct. 21, 1619. Frederick and E. occupied the throne of Bohemia only about a year. By the forces of the Catholic league, the army of Frederick was routed at the battle of Prague, Nov. 8, 1620, and the royal family fled into exile, for already the palatinate was laid waste. With her husband and children, and a few faithful attendants, E. took up her residence at the Hague, and ever afterwards the family lived in a state of dependence. E. was the mother of 13 children, the eldest of whom was accidentally drowned in Holland, and 3 others died young. The next were Charles-Louis and Rupert, and, following in order, were Elizabeth, Maurice, Edward, Philip, Louisa, Henrietta Maria, and Sophia. From this numerous offspring, E. derived little comfort in her misfortunes. Charles-Louis was a selfish, calculating person, with low, disreputable habits. Rupert (q.v.) the "mad cavalier," and his brother, Maurice, fought in England during the civil war, and, after the loss of the royalist cause at the battle of Naseby, they betook themselves to the sea, and for some time were little better than pirates. Edward, in 1645, abjured Protestantism, and was admitted into the Roman Catholic church. Philip committed an assassination at the Hague, fled from justice, became a soldier of fortune in France, and was slain in the civil wars. Elizabeth accepted the office of superior of the Lutheran abbey of Hervorden, Henrietta-Maria was espoused by Ragotzi, prince of Transylvania, but died shortly after her marriage. Louisa fled to France, and died as abbess of Maubisson. Previous to these events, E. became a widow by the death of Frederick, Feb. 17, 1629, when his right to the palatinate devolved on Charles-Louis, who, by the treaty of Westphalia, was restored to the family inheritance, Oct. 24, 1648. This favorable turn of affairs did not mend the fortunes of E., who was scandalously neglected by her son, the young elector-palatine; and all he would do for the family was to give a shelter to his youngest sister Sophia, until she was married to Ernest-Augustus, a scion of the house of Brunswick, who ultimately succeeded to the electorate of Hanover.

Deprived, in one way or other, of all her children, the queen of Bohemia—by which title she continued to be known—resolved to quit Holland. Relieved of her debts by the sale of jewels, and by aid of a pecuniary subsidy from the British parliament, she embraced an invitation from her nephew, Charles II., to come to England. She arrived May 17, 1661. From this time she was in a great measure indebted to the hospitality of lord Craven, in a mansion which he had purchased from sir Robert Drury, in Drury lane, London. Charles II. paid her little attention; but at her death, which occurred Feb. 13, 1662, he caused her remains to be interred in Westminster abbey. Charles-Louis, her son, died in 1680, leaving a son, who died without issue, and the palatinate then went to a distant branch of the family; he left also a daughter, Charlotte-Elizabeth, who, in 1671, had married Philip, duke of Orleans, only brother of Louis XIV. In 1674, she gave birth to a prince, who became the noted regent of France during the minority of Louis XV. She died at St. Cloud in 1722. The late Louis-Philippe, king of the French, was her lineal descendant. When, in 1708, the question of succession to the crown of Great Britain was debated, it was found that all the descendants of James I. were either dead or were Roman Catholics, except Sophia, electress of Hanover, and her family. By act of parliament, that year, the crown was accordingly secured to her and her descendants, "being Protestants;" and in virtue of this act of settlement, on the death of queen Anne, Sophia would have ascended the throne, but she predeceased the queen three months, and her son became sovereign of these realms as George I., Aug. 12, 1714. In this extraordinary and unforeseen manner did a grandson of the unfortunate queen of Bohemia become king of England, and originate the dynasty of the reigning monarch. The *Memoirs of Elizabeth Stuart, Queen of Bohemia*, by Miss Benger, 2 vols., may be perused as an accurate and pleasing piece of biography.

ELIZABETO'POL, a government in Asiatic Russia bordering on Persia; 17,038 sq.m.; pop. 503,282. The principal city bears the same name.

ELIZABETO'POL, a t. of Russian Transcaucasia, is situated in lat. 40° 42′ n., long. 46° 20′ east. The town consists of three parts, one of which is fortified with a bastioned wall. Its principal buildings are its churches and mosques, of which there are many. The town is remarkable for its numerous fruit-gardens and vineyards. Horticulture, the rearing of silk-worms, bees, and cattle, with agriculture and mining, are the chief occupations of the inhabitants. Pop. '67, 14,971, principally Tartars and Armenians.

ELK, a co. in central n.w. Pennsylvania, on the head waters of Clarion river, intersected by the Philadelphia and Erie, and Pennsylvania railroads; 700 sq.m.; pop. '70,

8,488. The surface is rough; coal-mining and lumbering are the leading occupations. Co. seat, Ridgeway.

ELK, IRISH, *Megaceros Hibernicus*, a large deer found in the pleistocene strata. There is a double error in its popular name, for it is a true deer, between the fallow and reindeer, and though abundant in Ireland, it is not peculiar to that country, being found also in England, Scotland, and on the continent of Europe. In Ireland, it occurs in the shell marl underlying the extensive turbaries. In England, lacustrine deposits and brick-clay contain its remains, and, associated with the mammoth and rhinoceros, they are found also in ossiferous caves. The most striking feature in this animal was its enormous antlers. A straight line drawn between their extreme tips in one specimen measured 10 ft. 10 inches. The form of the antler differs from that of any living species of deer. The beam enlarges and flattens into a palm; a brow snag exists as in the fallow-deer, but in adult specimens, this bifurcates and expands somewhat as in the reindeer—a peculiarity never observed in the fallow-deer group. The antler is also furnished with a back snag. Some idea of the enormous size and weight of the antlers may be formed from the fact that, in a specimen where the head weighed 5½ lbs., their weight was 81 lbs. To sustain this, the vertebræ of the neck and the limbs are very much larger and stronger than in any other deer. A fine and almost perfect specimen of this animal, from the Isle of Man, exists in the Edinburgh museum.

ELK, MOOSE, or MOOSE DEER, *Alces malchis*, or *cervus alces*, the largest existing species of the *cervidæ*, or deer family, is a native of the northern parts of Europe, Asia, and America. When full grown, it is about 6 ft. in height at the shoulders, and sometimes weighs 1200 lbs. The body is round, compact, and short; the neck is short and thick, unlike that of deer in general, but thus adapted for sustaining the great weight of the head and horns. The head is very large, narrow, about 2 ft. long. The horns in males of the second year are unbranched, not flattened and about 1 foot long; as the animal becomes older, they begin to display a blade, with more numerous snags, and in mature elks the blade becomes very broad, the snags sometimes 14 on each horn; a single antler has been known to weigh about 60 lbs. The horns have no basal snag projecting forwards. The ears are long, and have been compared to those of the ass. The eyes are small. The limbs are long, and very graceful. The tail is only about 4 in. long. The body is covered with coarse angular hair, which breaks when it is bent. On the neck and withers there is a heavy mane, and the throat is covered with long hair. A large goitre-like swelling under the throat of the younger elks has a very curious appearance. The hoofs of the E., like those of the reindeer and of the buffalo, are so constructed as to part widely, and to afford a better footing on soft marshy ground or on snow; they make a clattering when it runs. In running, it carries its muzzle forward, with the horns thrown back upon the neck, so that they may not be caught by branches. Its shoulders being higher than the croup, its common gait is a shambling trot; but it can also gallop with great rapidity. The color of the elk is brownish black, darker in winter than in summer; the limbs, the sides of the head, and the mane are of a lighter color than the body. Elks are sometimes seen in small herds, but often singly; they are now very rare in Europe, and are no longer found in parts of North America in which they were once common. They formerly extended as far s. as the Ohio. They are sometimes seen even on the shores of the Arctic ocean. They delight in marshy districts and in forests. When compelled to eat grass, they must get down on their knees to reach it; their proper food consists of the branches and foliage of shrubs and trees. They are very timid and inoffensive, except during the rutting season. A single stroke of an elk's fore-foot is sufficient to kill the strongest dog. It is also an extremely wary animal, and is with the greatest difficulty approached by the hunter. Its sense of smell is very acute, and the slightest sound excites its alarm. It is, however, much sought after in North America. In Sweden, its destruction is prohibited; and in Norway is placed under legal restrictions. The flesh of the elk is esteemed a good kind of venison; the fat is remarkably soft; the nose and the tongue are reckoned delicacies. The skin is used for a variety of purposes.

The elk is easily domesticated, and was at one time employed in Sweden for conveying couriers, being capable of traveling more than 200 m. in a day when attached to a sledge.

The elk of Ceylon is a deer of the group to which the name *rusa* has been given.

ELKESAI'TES, or ELCES'AITES, Jewish Christians of the 2d c., who held as the highest authority a work known as the *Book of Elxai*. This book was known to Origen, who reports that it was believed to have fallen from heaven, and was revealed by an angel who was the son of God. Its contents were made known only upon a pledge to keep them secret. Apparently the object of the sect was to mingle Judaism and Christianity, so that the Hebrews of that day could embrace the new doctrines without entire repudiation of their old belief. The fullest account of the *Book of Elxai* is found in the *Philosophonmena* of Hippolytus.

EL-KHAR'GEH, capital of the Great Oasis, Upper Egypt, is situated in lat. 25° 28′ n., long. 30° 40′ east. In the vicinity of the town are numerous ruins, among which are those of a temple; there is also a remarkable necropolis. Pop. 6,000.

ELKHART, a co. in n. Indiana, on the Michigan border, intersected by the St. Joseph's river and the Lake Shore and Michigan Southern railroad; 467 sq.m.; pop. '70, 26,026. The surface is generally level, with extensive oak and maple forests. The soil is fertile, producing wheat, corn, etc. Co. seat, Goshen.

ELKHART, a city in Elkhart co., Ind., on St. Joseph's river, and Lake Shore and Michigan Southern railroad, 101 m. e. of Chicago; pop. '70, 3,265. Three rivers converge here, affording abundant water power, supplying a rolling mill and many other manufactories.

ELKO, a co. in n.e. Nevada, drained by the sources of the Humboldt and Owyhee rivers, and crossed by the Central Pacific railroad; 13,800 sq.m.; pop. '75, 3,602. The surface is rough, 5 or 6 mountain ranges running n. and s. through the co., between which are wide and almost barren plains, with some rich bottom lands along the rivers. There are valuable mines, especially of silver. Co. seat, Elko.

ELKO, a village and seat of justice in Elko co., Nev., on the n. fork of the Humboldt river, and on the Central Pacific railroad; 460 m. n.e. of Sacramento; pop. about 1200. The place has a large trade with the mining districts. It is the seat of the state university.

ELL (allied to *el*bow, Ger. *ellen*bogen, Lat. *ulna*, the fore-arm or arm in general) is a measure of length now little used. It was originally taken in some vague way from the arm, and hence has been used to denote very different lengths. The Latin ulna appears to have denoted sometimes the measure from the elbow to the tips of the fingers, sometimes that between the outstretched hands. The English ell, as a measure of cloth, is equal to five quarters of a yard (q.v.).

ELLAG'GIC ACID, a constituent of animal secretions such as the bezoar stones found in the antelope. It may be produced by the decomposition of gallic acid.

ELLENBOROUGH, EARL OF. Edward Law, first earl of E., son of the first baron (many years chief-justice of the king's bench), was b. 1790; educated at Eton and at St. John's college, Cambridge, where he graduated M.A., 1809; succeeded his father in the barony in 1818; was lord privy seal in the duke of Wellington's administration, 1828–29; president of the board of control during the short-lived Peel administration of 1834–35; and appointed, on the return of sir Robert Peel in Sept., 1841, to the same office, which he relinquished a month afterwards for the post of governor-general of India. He received the thanks of parliament in 1843 for his "ability and judgment" in supporting the military operations in Afghanistan. In many other respects, his Indian administration was open to censure. He was charged with reserving his favor for the military, and inflicting undeserved slights upon the civil servants of the company. He made showy progresses; addressed proclamations to the rulers and natives of India which appeared to sanction idolatry; and, finally, in his proclamation concerning the sandal-wood gates of the temple of Juggernaut, when brought back from Ghuznee, he reached the climax of a series of extravagances, which induced the directors of the East India company to exercise a power only used in extreme cases, and to recall him. The ministry, however, stood by him, and he was created by the crown an earl and a viscount; he also received the distinction of G.C.B. In 1846, sir R. Peel made him first lord of the admiralty, an office which he resigned in July of the same year, when the disruption of the Peel administration took place. In the Derby administration of 1858, he was again minister for India, and the author of an India bill, which failed to obtain the sanction of parliament. Having permitted a dispatch to see the light, in which he had administered a severe and caustic rebuke to viscount Canning, governor-general of India, an outcry was raised against him, which threatened the existence of the Derby government. To avert this result, lord E. resigned. He afterwards took a frequent and influential part in the debates of the upper house. He was styled, by no less a judge than M. Guizot, "the most brilliant of the tory orators." He was twice married—first to a daughter of the marquis of Londonderry, and second to the daughter of admiral Digby. His divorce from the latter made some noise at the time. E. died without issue, Dec. 2, 1871, when the earldom and viscounty became extinct.

ELLENBOROUGH, EDWARD LAW, Lord, 1750–1818; chief-justice of the court of king's bench; educated at Cambridge, and a fellow of Trinity college; studied law, and was called to the bar in 1780, speedily gaining a large practice and a high reputation. He was principal counsel for Warren Hastings in the famous impeachment trial. He began political life as a whig, but the French revolution made him a supporter of Pitt. In 1801, he was appointed attorney-general; the next year he succeeded to the king's bench as chief-justice, and at the same time was made a peer. He was also a member of the Grenville cabinet. As a judge he showed profound legal knowledge, and was especially an authority on mercantile law; but he was harsh and overbearing to counsel, and generally against any prisoner tried for a political offense. In the trial of Hone for blasphemy he directed the jury to return a verdict of guilty, but they brought in one for acquittal—an event which is thought to have hastened the judge's death.

ELLENRIEDER, MARIE, a female painter of very high excellence, was b. at Constance in 1791, studied in Munich, and in 1820 went to Rome, to perfect her knowledge

of art. Her admiration of the old German masters gave a religious bent to her genius. On her return to Germany, she resided for some time at Carlsruhe, where she painted a "Martyrdom of St. Stephen" as an altar-piece for the Roman Catholic church. She was afterwards appointed court-painter at Munich, but she chose to fix her residence at Constance, and devoted herself exclusively to her profession. Among her principal pieces are the "Transfiguration of St. Barthelemy;" "Christ Blessing Little Children;" "Mary and the Infant Jesus;" "Joseph and the Infant Jesus;" "St. Cecilia;" "Faith, Hope and Charity;" and a Madonna. Marie E. is reckoned in Germany the greatest female artist of the present age. So full of ideal grace and beauty are the heads of her women and children, in particular, that it has been said that "she seems to paint in the presence of angels;" her coloring, however, is gray, dull, and somber, like that which prevails among the old masters of the German school. She died in June, 1863.

ELLERY, WILLIAM, 1727–1820; b. R. I.; graduated at Harvard, and went into trade in Newport; afterwards began the practice of law, and in 1776 was elected to the continental congress, where, with his fellow member from Rhode Island, Stephen Hopkins, he signed the declaration of independence. With the exception of the two years 1780 and 1782 he was in congress until 1786, and was one of the most influential members. In 1790, he was appointed collector of customs at Newport, and held the office during life.

ELLESMERE, a t. in the n.w. of Shropshire, near a beautiful lake or mere, 19 m, n.n.w. of Shrewsbury. Pop. '71, 2,013. It has considerable malting establishments. On the present site of a bowling-green once stood an ancient castle, alternately held by the English and Welsh.

ELLESMERE, first EARL OF, politician, patron of the arts, and author. Francis Egerton, second son of the first duke of Sutherland, was b. 1800; graduated at Christ Church, Oxford, where he was second-class in classics, 1820; entered the house of commons, 1820, and represented successively Bletchingly, Sutherland co., and South Lancashire; filled the office of chief-secretary for Ireland from Jan., 1828, to July, 1830, and secretary at war from July to Nov., 1830; in 1833, assumed the name of lord Francis Egerton, in lieu of his patronymic Leveson-Gower. He achieved considerable literary distinction as a writer of graceful poems, translations from the German, etc. He also published a pamphlet on the defenseless state of the coasts and of the metropolis, which called forth some adverse criticism. He was a munificent patron of the arts, and made many valuable additions to the collection of pictures which he inherited with the large estates of the last duke of Bridgewater. He also built a noble gallery for their reception, which he liberally threw open to the public. After faithfully voting with the conservative party in parliament for a quarter of a century, he, on the retirement of the Peel administration in 1846, obtained a revival in his favor of the peerages of Ellesmere and Brackley. His last public appearance was in May, 1856, when he moved, in the house of lords, an address to the crown, approving of the treaty of peace after the war with Russia. He died in 1857 at his new mansion, Bridgewater house, London, and was succeeded in the earldom by his eldest son, viscount Brackley.

ELLET, CHARLES, Jr., 1810–62; b. Penn.; an engineer, builder of the first wire suspension bridge in the United States (over the Schuylkill, at Fairmount, near Philadelphia); architect of the first suspension bridge over the Niagara river below the falls, and of the first one at Wheeling. During the war of the rebellion he built a number of steam rams for the western rivers, with which he took part in the battle in the Mississippi at Memphis, June 4, 1862, sinking or disabling a number of confederate vessels. He received a wound on that occasion, from the effects of which he died.

ELLET, ELIZABETH FRIES, 1818–77; b. N. Y.; wife of William H., and author of sketches, poems, etc. At 17 years of age she published a volume of poems, and about the same time wrote *Teresa Contarini*, a tragedy based on Venetian history. In 1841, she published *The Characters of Schiller*, following with *Women of the American Revolution; Evenings at Woodlawn; Family Pictures from the Bible; Domestic History of the American Revolution; Watching Spirits; Pioneer Women of the West; Novelettes of the Musicians; Summer Rambles in the West; Women Artists in All Ages and Countries; Queens of American Society;* and *Court Circles of the Republic.* She was also a frequent contributor to periodicals.

ELLET, WILLIAM HENRY, 1804–59; b. N. Y.; graduated from Columbia college, where he was professor of chemistry in 1832; in 1835, professor of chemistry, mineralogy, and geology in South Carolina college. The South Carolina legislature presented him with a testimonial for the discovery of a cheap method of manufacturing gun-cotton. His latest work was that of consulting chemist to one of the great gas manufacturing companies of New York.

ELLEZELLES, a large village of Belgium, in the province of Hainault. Linen-weaving is extensively carried on. There are several flour-mills, breweries, and a salt-refinery. Pop. 6,200.

ELLICOTT, ANDREW, 1754–1820; b. Penn. His scientific attainments caused his employment at various times for marking the boundaries of Virginia, New York, and Pennsylvania; and in 1789 he surveyed the country between Pennsylvania and

lake Erie, making the first accurate measurement of Niagara river. In 1790, he laid out the proposed city of Washington, now the federal capital, and in 1796 he was one of the commissioners to settle the southern boundary between the United States and Spanish territory. Later in life he was professor of mathematics at West Point, He was an active member of the American philosophical society, and a frequent contributor to the *Transactions* of that body.

ELLICOTT, CHARLES JOHN, D.D., b. 1819; bishop of Gloucester and Bristol. He graduated at Cambridge in 1841, and was ten years rector of Pilton, Rutlandshire, but in 1858 became professor of divinity in King's college, London, and in 1860, Hulsean professor of divinity at Cambridge. In 1861, he was made dean of Exeter, and in 1863 bishop. He is the author of a *Treatise on Analytical Statics; The History and Obligation of the Sabbath; Lectures on the Life of our Lord Jesus Christ;* and *Considerations on the Revision of the English Version of the New Testament;* but his most important works are *Commentaries* of a number of the New Testament Epistles, eminent for thoroughness of grammatical criticism.

ELLICOTT CITY, the chief t. of Howard co., Md., on the Patapsco river and the Baltimore and Ohio railroad, 12 m. w.s.w. of Baltimore; pop. 1722. The soil is excellent; water power is abundant, and many flour mills and other manufacturing establishments are in operation. There are two Roman Catholic colleges in the place.

ELLIOT, EBENEZER, the CORN-LAW RHYMER, was b. at Masborough, in Yorkshire, Mar. 7, 1781. His father was a man of strong character and narrow opinions, and, as appears from Ebenezer's autobiography (published in the *Athenæum* in 1850), exercised no little influence on his son's modes of thinking and sympathies. When a boy at school, E. was not a quick pupil; and even after his father had sent him to work in the iron-foundry, where he himself held the situation of a clerk, the youth exhibited no fondness for reading. Before long, however, he entirely changed, and commenced to study Milton, Shakespeare, Ossian, Junius, and other authors. His first published poem was composed in his 17th year; it is entitled *The Vernal Walk.* This was succeeded by *Night; Wharncliffe;* etc. In 1821, E. began business as an iron-founder on his own account at Sheffield. He was very successful; and in 1841 retired to an estate which he had purchased at Great Houghton, near Barnesley, where he died 1st Dec., 1849. E.'s principal productions are *Love,* accompanied with a letter to lord Byron; his famous *Corn-law Rhymes; The Ranter;* and *The Village Patriarch,* a work full of noble and earnest poetry, all of which appeared between 1823–30. In 1834, he issued a collected edition of his works, in 3 vols.; and in 1840, an edition in one volume. E. followed Crabbe, but with more depth and fire of feeling, in depicting the condition of the poor as miserable and oppressed, tracing most of the evils he deplores to the social and political institutions of the country. The laws relating to the importation of corn were denounced by E. as specially oppressive, and he inveighed against them with a fervor of manner and a harshness of phraseology which ordinary minds feel as repulsive, even while acknowledged as flowing from the offended benevolence of the poet. But the glow of earnestness kindles his verse, and hides a multitude of faults. More enduring, however, than his rhyming philippics, are his descriptions of English, and especially of Yorkshire scenery, and his delineations of humble virtue and affection. These are instinct with the purest spirit of poetry.

ELLIOTT, a co. in n.e. Kentucky, drained by the head-waters of the Little Sandy river; pop. '70, 4,433—22 colored. It is hilly, with much forest land. Productions, wheat, corn, etc. Iron ore and coal are found. Co. seat, Sandy Hook.

ELLIOTT, CHARLES, D.D., LL.D.; 1792–1869; b. Ireland, where he joined the Wesleyan Methodists, and prepared for the ministry. At the age of 23, he came to America, and in 1818 joined the Ohio conference; in 1822, he was superintendent of missions among the Wyandot Indians; afterwards for five years presiding elder of the Ohio district; then for four years professor of languages in Madison college (Uniontown, Penn.). He was a few years later presiding elder of the Pittsburg district, editor of the *Pittsburg Conference Journal,* and subsequently of the *Western Christian Advocate* (Cincinnati). In 1857, he became professor of Biblical literature and president of the Iowa Wesleyan university. About 1860, he became editor of the *Central Christian Advocate* at St. Louis. Among his works are *Treatise on Baptism; Delineation of Roman Catholicism; History of the Great Secession from the Methodist Episcopal Church; Political Romanism; Reminiscences of the Wyandot Mission; South-western Methodism;* works against slavery, biographies, etc.

ELLIOTT, CHARLES LORING, 1812–68; b. New York, the son of an architect. Having an inclination for painting, he became a pupil of Trumbull, and afterwards of Quidor. He was for some time in New York city, where his efforts began to attract attention. After working chiefly on portraits for several years in the w. part of the state, he returned to the city, where he soon became the chief of portrait painters, having at his easel many hundreds of the most eminent citizens.

ELLIOTT, CHARLES WYLLYS, b. Conn., 1817; a descendant of the "apostle to the Indians." He began business as a merchant in New York, took up the study of horticulture and landscape gardening with A. J. Downing, and practiced the business in

Cincinnati. Returning to New York, he became one of the founders of the "Children's Aid Society," and was chosen a commissioner to lay out the Central park. Among his works are: *Cottages and Cottage Life; Mysteries—or Glimpses of the Supernatural; San Domingo—Its Revolution, and its Hero, Toussaint L'Ouverture; New England History from the Discovery of the Continent by the Northmen in* 986 *to* 1776; *Remarkable Characters and Places in the Holy Land*, etc.

ELLIOTT, JESSE DUNCAN, 1782–1845; b. Philadelphia; midshipman in the U. S. navy in 1804, rising to capt. in 1818. He was in the *Essex* in the war with Tripoli, and on the lakes under Perry and Chauncey in the war of 1812, where he commanded a boat expedition which captured two English brigs. In Perry's great victory, Elliott commanded the *Niagara*. He succeeded Perry in command on the lakes; in 1815, he was in the Mediterranean squadron; was commissioner to select sites for dockyards, light-houses, and fortifications on the North Carolina coast; and later, commanded the *Constitution* in the Mediterranean. His conduct did not meet with approbation, and he was tried by court-martial and suspended for four years. A portion of the sentence was remitted, and he was made commandant of the Philadelphia navy-yard in 1844.

ELLIOTT, STEPHEN, LL.D., 1771–1830; b. S. C.; a botanist; graduate of Yale. He was instrumental in establishing the literary and philosophical societies of South Carolina, and was their president. He also assisted in establishing the state medical college, of which he was one of the faculty. He published *The Botany of South Carolina and Georgia*. He was for a time the editor of *The Southern Review*

ELLIOTT, STEPHEN, D.D., 1805–66; son of the botanist; b. S. C.; graduate of Harvard; a lawyer until 1833; ordained in the Protestant Episcopal church, 1838. Soon afterwards he was appointed professor of sacred literature in South Carolina college. In 1840, he was chosen Protestant Episcopal bishop of Georgia.

ELLIOTT, WILLIAM, 1788–1863; b. S. C.; studied at Harvard; was in both branches of the legislature of his state, and in 1832 resigned rather than support nullification. He published *Fiesco*, a tragedy; *Carolina Sports by Land and Water;* and many political letters and essays.

ELLIPSE' is the name of a figure in geometry, important from its being the approximate shape of the planetary orbits. It is a curve of the second order, and is a conic section, formed by cutting a right cone by a plane passing obliquely through its opposite sides. It may be defined as a curve, the sum of the distances of every point in which from two fixed points within the curve is always the same. These two fixed points are called the foci; and the diameter drawn through them is the major axis; the minor axis bisects the major at right angles. The distance of either focus from the middle of the major axis is the *eccentricity*. The less the eccentricity is compared with the axis, the nearer the figure approaches to a circle; and a circle may be considered as an E. whose foci coincide.

There are various contrivances for describing an E., called ellipsagraphs or *elliptic compasses*. The simplest method of description is to fix on a plane the two ends of a thread with pins in the foci, and make a pencil move on the plane, keeping the thread constantly stretched. The end of the pencil will trace an E., whose major axis is equal to the length of the thread.

The equation to an E. (see CO-ORDINATES), referred to its center as origin, and to its major and minor axes as rectangular axes, is $\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$, where a and b are the semi-major and semi-minor axes respectively. From this equation, it may be shown, by the integral calculus, that the area of an E. is equal to πab; or is got by multiplying the product of the semi-major and semi-minor axis by 3.1416. It may also be shown that the length of the circumference of an E. is got by multiplying the major axis by the quantity $\pi\left(1-\frac{d^2}{2^2}-\frac{3d^2}{2^4.4^2}-\frac{3^2.5d^2}{2^6.4^2.5^2}-\text{etc.}\right)$, where $d=\frac{1-4b^2}{4a^2}$.

ELLIP'SIS (Gr. omission) is a term used in grammar and rhetoric, to signify the omission of a word necessary to complete the expression or sentence in its usual form. The object of E. is shortness and impressiveness; accordingly, it prevails in proverbs. Ellipses are used in all languages, but the same forms of ellipses are not common to all. Thus, "the house we saw," instead of "the house *that* we saw," is a kind of E. peculiar, so far as we know, to English.

ELLIP'SOID is a surface of the second order, of which the spheroid (q.v.) is a species, and the most interesting, from the fact of the form of the earth being spheroidal. The equation to an E. referred to its center and rectangular co-ordinates is $\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{c^2}=1$.

ELLIPTI'CITY (of the earth). See EARTH.

ELLIS, a co. in w. Kansas, drained by Saline and Smoky rivers, and crossed by the Kansas Pacific railroad; 900 sq.m.; pop. '78, 2,437. It is mostly prairie, and the soil is fertile. Co. seat, Hays City.

ELLIS, a co. in n.e. Texas, on Trinity river, intersected by the Houston and Texas Central railroad; 1100 sq.m.; pop. '70, 7,514—1506 colored. The surface is undulating, with plenty of timber; soil fertile, producing corn, cotton, wheat, etc. Co. seat, Waxahatchie.

ELLIS, ALEXANDER JOHN, F.R.S., F.S.A., was b. at Hoxton in 1814, and educated at Shrewsbury, Eton, and Trinity college, Cambridge, taking his B.A. degree in 1837. His name by birth was Sharpe, which was changed by royal license in 1825. He was elected a fellow of the royal society in 1864, and of the society of antiquaries in 1870. He was president of the philological society during 1872–74, and is a member of the philosophical and mathematical societies of London. Among his numerous and valuable works may be noted: *Alphabet of Nature* (1845); *Essentials of Phonetics* (1848); *Universal Writing and Printing* (1856); *Early English Pronunciation* (1869–71); *Practical Hints on the Quantitative Pronunciation of Latin* (1874); translation of Helmholtz's *Sensations of Tones as a Physiological Basis for the Theory of Music* (1875).

ELLIS, GEORGE EDWARD, D.D.; b. Boston, 1814; graduate of Harvard and of Cambridge divinity school; in 1840, Unitarian pastor in Charlestown, Mass.; resigning in 1869; in 1857, professor of doctrinal theology in the Cambridge divinity school. In 1864, he delivered the Lowell lectures in the evidences of Christianity. He wrote lives of John Mason, Anne Hutchinson, and William Penn, for Spark's *American Biography;* and published the *Half Century of the Unitarian Controversy; The Aims and Purposes of the Founders of Massachusetts;* and various memoirs and biographies. For several years he was editor of the *Christian Examiner*.

ELLIS, WILLIAM, an eminent English missionary, was b. in the year 1795. In Jan., 1816, he sailed with his wife for the South Sea islands, as a missionary of the London missionary society, and labored there for nearly ten years. He set up in Tahiti the first printing-press in the South Sea islands. In 1824, he returned to England, on account of the illness of his wife. He was for some years employed at home in the business of the London missionary society. In 1826, he published a *Narrative of a Tour through Owhyhee;* and in 1829, *Polynesian Researches,* 2 vols. In 1839, he published a *History of Madagascar,* 2 vols., compiled from government papers, and information received from missionaries. In 1835, his wife died, and two years afterwards he married Miss Sarah Stickney, who for many years conducted a school for girls at Hoddesdon, in Hertfordshire, and who is well known as the authoress of many popular works, among which are *The Women of England* (1838), *The Daughters of England* (1842), *The Wives of England* (1843), *Hearts and Homes* (1848–49), and *The Mothers of Great Men* (1859). Her works are all of an excellent moral and religious tendency, and have been very widely circulated both in Britain and America. She was educated among the Society of Friends, to which her parents belonged.—In 1853, Mr. E. was sent to Madagascar by the London missionary society, to inquire into the state of things in that island, and particularly into the condition and prospects of the Christians there. In 1859, he published an interesting and valuable work, entitled *Three Visits to Madagascar, during* 1853–56, *with Notices of the People, Natural History,* etc., a work to which we are largely indebted for our present information concerning that island. In his *Polynesian Researches,* as well as in this work, Mr. E. gives much information concerning the inhabitants, scenery, and productions of the countries which he visited, and few works of greater general interest or higher value have come from the pens of modern missionaries. In 1867, he published another work, the nature of which appears from its title, *Madagascar Revisited, describing the Events of a New Reign, and the Revolution which followed, setting forth also the Persecutions endured by the Christians, and their Heroic Sufferings, with Notices of the Present State and Prospects of the People.* He died in 1872.

ELLIS, WILLIAM, an English missionary and author. He was a poor boy with a scanty education, but bright and intelligent. When 20 years old, having come under deep religious impressions, he offered himself as a missionary to the London missionary society, and after spending a year in studying theology and acquiring several practical arts, such as printing and book-binding, he was sent to the South Sea islands in 1816, and reached his destination a year later. Here his labors were exceedingly fruitful, contributing much toward the great and beneficent changes that have taken place during the present century in that portion of the world. At the end of seven years he was compelled by the illness of his wife to return to England. The homeward voyage was made by way of the United States, where he spent several months in traveling and addressing missionary meetings, doing much thereby to arouse a missionary spirit in the American churches. On his arrival in his native land, he was appointed traveling agent of the London missionary society, whose principles and purposes he advocated in nearly every important town in Great Britain. While thus employed he published his *Tour through Hawaii,* which he had written while on the journey home; and also his *Polynesian Researches,* in two volumes, a work of much interest and value. In 1832, he was appointed foreign secretary of the society which he had so long served in other capacities, discharging the duties of the office with zeal and efficiency for seven years till ill-health compelled his resignation. During this period he had married his second wife, Miss Sarah Stickney, the well-known author, and published his *History of Madagascar.* After resting for a time in France, he took up his residence at Hoddesdon, Hertford-

shire, where, in 1847, he became pastor of a small Congregational church. At length he was called by the London missionary society to visit Madagascar, to promote the resumption of the missionary enterprise there. The results of this agency are set forth in his *Three Visits to Madagascar;* one of the most romantic narratives in the whole literature of missions. He made a fourth visit to the island in 1863, of which an account will be found in his *Madagascar Revisited.* He also wrote and published *A Vindication of the South Sea Missions from the Misrepresentation of Otto von Kotzebue;* and *Village Lectures on Popery.*

ELLISTON, ROBERT WILLIAM, 1774–1831; b. London; appeared as an actor at Bath when 17 years old; and in London at 22, where he rose to a leading position. He was lessee of Drury Lane in 1819; afterwards of the Surrey theater. Elliston was considered the best comedian of his time.

ELLO'RA, a decayed t. in the dominions of the Nizam, not far from the city of Dowlatabad, in lat. 20° 2′ n., and long. 75° 13′ east. It is celebrated for its wonderful rock-cut temples. Their number has not been precisely ascertained, but Erskine reckoned 19 large ones, partly of Hindu and partly of Buddhist origin. Some are cave-temples proper—i.e., chambers cut out in the interior of the rock—but others are vast buildings hewn out of the solid granite of the hills, having an exterior as well as an interior architecture, and being, in fact, magnificent monoliths. In executing the latter, the process was, first to sink a great quadrangular trench or pit, leaving the central mass standing; and then to hew and excavate this mass into a temple. The most beautiful of these objects is the Hindu temple, Kailasa. At its entrance, the traveler passes into an antechamber 138 ft. wide by 88 deep, adorned by numerous rows of pillars. Thence he proceeds along a colonnade over a bridge into a great rectangular court, which is 247 ft. in length and 150 broad, in the center of which stands the temple itself, a vast mass of rock richly hewn and carved. It is supported by four rows of pilasters, with colossal elephants beneath, and seems suspended in the air. The interior is about 103 ft. long, 56 broad, and 17 high, but the entire exterior forms a pyramid 100 ft. high, and is overlaid with sculpture. In the great court are numerous ponds, obelisks, colonnades, sphinxes, and on the walls thousands of mythological figures of all kinds, from 10 to 12 ft. in height. Of the other temples, those of Indra and Dumarheyna are little inferior to that of Kailasa. Regarding their antiquity and religious significance, authorities are not agreed; but at all events they must be subsequent to the epic poems *Ramayana* or *Mahabharata,* because they contain representations taken from these poems, and also to the cave-temples at Elephanta, because they exhibit a richer and more advanced style of architecture.

ELLORE, a t. of the district of Godavari, in the province of Madras, stands in lat. 16° 42′ n., and long. 81° 10′ east. According to the census of 1871, the pop. of E. was 25,487. E. was formerly an important military station, and has at present carpet manufactures. The town occupies both banks of the Jummulair, a torrent of the eastern Ghauts, which, instead of reaching the bay of Bengal, loses itself 3 m. further down, in the landlocked Colair lake. In fact, for about 50 m. to the westward of the sea, the neighboring country is depressed below the level of the maritime belt, the stagnant pool above mentioned not only having independent feeders of its own, but also receiving supplies, in the season of high-water, from the Kistnah or Krishna, and the Godavery. Under such circumstances, the climate of E. is at once unpleasant and unhealthy. During the s.w. monsoon, bringing with it, of course, the accumulated heats of the whole breadth of the peninsula, the temperature is more particularly oppressive, having been known to rise, in the night, to 120° F.

ELLSWORTH, a co. in central Kansas, on Smoky river, crossed by the Kansas Pacific railroad; 720 sq.m.; pop. '78, 5,057. The surface is nearly all prairie, and the soil fertile, producing corn, wheat, etc. Co. seat, Ellsworth.

ELLS'WORTH, a small but flourishing t. of North America, in the state of Maine, on both sides of the navigable river Union, 30 m. s.e. of Bangor, and about 4 m. w. of Frenchman's bay. It exports 50,000,000 ft. of timber annually, carries on cod and mackerel fisheries, and had, in 1870, 5,275 inhabitants.

ELLSWORTH, a port of entry, city, and seat of justice of Hancock co., Me., on Union river near the sea, 28 m. s.e. of Bangor; pop. '70, 5,257. The chief occupations are lumbering, navigation, and fishing.

ELLSWORTH, EPHRAIM ELMER, b. N. Y., 1837; killed May 24, 1861, at Alexandria, Va. Before the rebellion he organized a company of zouaves, with which he traveled in different parts of the country, in the summer of 1860, winning great praise by the perfection of their drill. In April, 1861, he organized a zouave regiment from the volunteer firemen of New York city. His regiment took part in the first advance of the national forces from Washington into Virginia. Ellsworth, as they entered Alexandria, went into a hotel to take down a secession flag which was flying from its roof, and while coming out with it was met and shot dead by the landlord, who the next moment was also dead—killed by Ellsworth's soldiers.

ELLSWORTH, OLIVER, LL.D., 1745–1807; b. Conn.; graduated at the college of New Jersey in 1766, and began the practice of law at Hartford. He was a member of

the Connecticut general assembly, and in 1777, a delegate to Congress. From 1780 to 1784, he was a member of the council of Connecticut, and in the latter year was appointed judge of the superior court. In 1787, he was sent as a delegate to the convention which framed the first constitution of the United States. He was one of the first U. S. senators from Connecticut, and at the end of his term was nominated by Washington chief-justice of the U. S. supreme court. After five years' service he resigned; but in the mean time he was sent to France as one of the commissioners to negotiate a treaty with that nation. Returning to Connecticut, he was chosen chief-justice of the supreme court, but declined to accept the place.

ELLSWORTH, WILLIAM WOLCOTT, LL.D.; 1791–1868; son of Oliver; b. Conn.; graduate of Yale, and professor of law in Trinity college. He was judge of the supreme court of the state from 1847 to 1861, a member of congress in 1829, and governor of Connecticut in 1838.

ELL'WANGEN, a t. in Würtemberg, 55 m. n.e. of Stuttgart; a place of considerable importance in manufacturing; pop. '70, 4,155. It is the seat of government of the circle of Jaxt.

ELLWOOD, THOMAS, 1639–1713; an English author noted for his intimacy with Milton, whom he met through an introduction by a Quaker family, and to whom he became reader of Latin. Ellwood had become a Quaker, to his father's great disgust, and with the result of bringing upon himself much persecution. Milton gave Ellwood the manuscript of *Paradise Lost* to read, and asked his opinion of it. In returning it, Ellwood suggested *Paradise Found* as a subject; and this, as Milton long afterward said, suggested to his mind the supplementary poem of *Paradise Regained*. It may be the general opinion that it would have been as well for the great poet if Ellwood had kept his idea to himself. Ellwood was the author of a number of polemical works, among them *Forgery no Christianity; The Foundation of Tithes Shaken;* and *Sacred Histories of the Old and New Testaments*.

ELM, *Ulmus*, a genus of trees of the natural order *ulmaceæ*, natives of temperate climates, with serrated leaves unequal in their two sides, and small flowers growing in clusters appearing before the leaves, and containing 4 to 12 stamens and one germen. The fruit is a samara, or compressed one-seeded little nut, winged all around. One of the most important species is the COMMON SMALL-LEAVED or ENGLISH ELM (*U. campestris*), a tree of 60 to 80 ft. in height, with ovato-elliptic, doubly serrated leaves, and flowers almost destitute of stalks. The wood is compact, and very durable in water. The tree is diffused all over Europe; is found also in the w. of Asia and n. of Africa, and is used for a great variety of purposes by wheelwrights, machine-makers, ship and boat builders, etc.; it is also prized by joiners for its fine grain, and the mahogany color which it readily assumes on the application of an acid. It is reckoned superior to the wood of any other species of elm. The bark is used in dyeing and in sugar-refining, and, in times of scarcity, has been used in Norway for grinding into meal and mixing in bread, which has a less disagreeable taste than that made from meal mixed with fir-bark. The inner bark is used medicinally in cutaneous diseases; it is mucilaginous, and has a bitter astringent taste. The ELM BALSAM (*beaume d'orme*,) which was formerly in great repute, is a brownish substance, which is found in dried galls of the leaves in the s. of Europe, Persia, etc. From these galls, in an earlier stage, flows a clear, viscid, sweetish liquid, called elm water (*eau d'orme*), which is used for washing wounds, contusions, and sore eyes.—The seeds of the E. are eagerly eaten by pigeons and common poultry. The E. is one of the principal timber trees of Britain, most extensively planted, and a chief ornament of English scenery.—The CORK-BARKED ELM (*U. suberosa*), by many regarded as a variety of *U. compestris*, is distinguished by the corky wings of the bark of the branches. It is a taller and more spreading tree, with much larger leaves. It is a European tree, common in plantations in Britain, but a doubtful native.—The DUTCH CORK-BARKED ELM (*U. major*) is also looked upon by many as a variety of *U. campestris*. It is still more corky in its bark, and has still larger leaves. It is of very quick growth, but the wood is very inferior.—The BROAD-LEAVED or WYCH ELM (*U. montana*) is the only species that can with certainty be regarded as indigenous to Scotland. It has rough and broad leaves, a stem less upright than the English E., and large spreading branches. The wood is used for all the purposes of the English elm. The tree is of very quick growth. Protuberances of gnarled wood are not unfrequently produced, which are finely knotted and richly veined; they are much esteemed for veneering, and are sometimes very valuable. Varieties of this species are known as the GIANT ELM and CHICHESTER ELM.—The SMOOTH-LEAVED ELM (*U. glabra*) is by some regarded as a variety of *U. montana*, but is distinguished, besides other characters, by smooth leaves, which are much smaller. It is a native of England. A variety called the HUNTINGDON ELM is much esteemed.—The CORNISH ELM (*U. stricta*), found in the s.w. of England, is remarkable for its rigid, erect, and compact branches.—Very different is the habit of *U. effusa*, a continental species with a large spreading head and smooth bark, distinguished also by the long stalks of its flowers and its ciliated fruit.—The AMERICAN or WHITE ELM (*U. Americana*), which abounds in the basin of the Mississippi, and attains its loftiest stature between lat. 42° and lat. 46°, is a magnificent tree, sometimes 100 ft. in height the trunk reaching 60 or

70 ft. before it separates into branches, and the widely diffused pendulous branches floating gracefully in the air; but the timber is not much esteemed.—The RED or SLIPPERY ELM (*U. fulva*) is also common in the basin of the Mississippi as far s. as lat. 31°, and in the western parts of Canada. It attains a height of 50 or 60 feet. The wood is more valuable than that of the last species, but much inferior to the English elm. The leaves and bark yield an abundant mucilage, which is bland and demulcent, and esteemed a valuable remedy in catarrh, dysentery, and other complaints.—The WAHOO or WINGED ELM (*U. alata*) is a small tree, found from lat. 37° to Florida, Louisiana, and Arkansas, remarkable for the branches being furnished on two opposite sides with wings of cork. The wood is fine-grained, compact, and heavy.—*U. Chinensis* is a Chinese species of E., the leaves of which often bear galls used by the Chinese in tanning and dyeing.

The name SPANISH ELM is given in the West Indies to a tree also called BOIS DE CHYPRE, *cordia gerascanthus*, of the natural order *cordiaceæ*, the timber of which is valuable; also to *hamelia ventricosa*, of the natural order *rubiaceæ*, the timber of which is known to cabinet-makers as prince-wood.

ELMI'NA, a fortified t. and seaport of West Africa, formerly capital of the Dutch settlements on the Gold coast, is situated in an undulating and thickly wooded district, in lat. 5° 10′ n., and long. about 1° 40′ west. It is a large, irregularly built town; and seems to be destitute of any noteworthy architectural features. The inhabitants consist chiefly of traders, fishermen, and artisans. A few miles to the e. is cape Coast Castle. E. was established by the Portuguese in 1481, and was the first Eropean settluement on the coast of Guinea. It was taken by the Dutch in 1637, and four years after, was ceded to them by Portugal. It was ceded to the British in 1872, and destroyed by them in 1874, during the Ashantee war. Pop. 12,000 to 15,000.

ELMI'RA, a t. of New York state, contains, according to the census of '75, 20,538 inhabitants. In point of situation, it possesses both natural and artificial advantages. It stands on the Chemung, a navigable feeder of the Susquehanna; it it connected by canals with Seneca lake and the interior of Pennsylvania, and by the Erie and Northern Central railways with New York, Philadelphia, etc. It possesses important iron and steel works, flour mills, breweries, tanneries, etc. E. is 273 m. distant from the capital of the state.

ELMIRA, (*ante*), a city and seat of justice of Chemung co., N. Y., on the Chemung river and canal, and the Erie, the Northern Central, the Tioga and Elmira State Line, and the Utica, Ithaca, and Elmira railroads; pop. '75, 20,436. In the city are a college for women, a free academy, a Roman Catholic academy, the New York state reformatory institution, and a large number of manufactories of railroad machinery, farming implements, tools, etc. It has a beautiful park of 300 acres, street railways, and water works. Its growth has been both rapid and substantial. The region around it is very fertile, and the city has an extensive trade. In the war of the rebellion it was made a great recruiting station, and was also the site of a military prison. The place was settled in 1790 and chartered as a city in 1864.

ELMORE, a co. in central Alabama, intersected by the Coosa and bounded by the Tallapoosa river, and crossed by the Eufaula and Montgomery railroads; 775 sq.m.; pop. '70, 14,477—6,730 colored. The surface is undulating, and the soil fertile; the productions are wheat, corn, and cotton. Co. seat, Wetumpka.

EL'MO'S FIRE, ST., is the popular name of an appearance sometimes seen, especially in southern climates during thunder-storms, of a brush or star of light at the tops of masts, spires, or other pointed objects. It is sometimes accompanied by a hissing noise, and is evidently of the same nature as the light caused by electricity streaming off from points connected with an electrical machine. See ELECTRICITY. The phenomenon, as seen at sea, was woven by the Greeks into the myth of Castor and Pollux; and even yet such lights at the mast-head are considered by sailors a sign that they have nothing to fear from the storm.

ELMSHORN, a t. in the Prussian province of Schleswig-Holstein, 20 m. n.w. of Hamburg, is situated on both banks of the Krückau, a navigable stream, and feeder of the Elbe. It is well-built, has considerable manufactures and an active trade in grain; it has also a boat-building yard and some tanneries. Vast numbers of boots and shoes are made at E., and are sold at all the fairs in the country round about. Many Jews reside here, as this was one of the few places in Schleswig or Holstein in which they were allowed to settle without having previously obtained permission. E. has an important annual cattle-market. Pop. '75, 5,183.

EL OBEID. See IL OBEID, or EL OBEID.

ELOCU'TION (Lat. for speaking out), the art of effective speaking, more espccially of public speaking. It regards solely the utterance or delivery; while the wider art of oratory, of which E. is a branch, takes account also of the matter spoken. The art of E. held a prominent place in ancient education, but has been greatly neglected in modern times. See READING AND SPEAKING.

ÉLOGE. When a member of the French *académie* dies, it is customary for his successor to deliver an oration, setting forth his merits and services. This is called an *éloge* (Lat. *elogium*, Gr. *eulogia*, praise), and a considerable branch of French literature goes by the name. Many of the French éloges are mere florid panegyrics; but others, particularly those written by Thomas, D'Alembert, Bailly, Condorcet, Cuvier, and other eminent savants, are interesting and valuable biographies. The proper epoch of the éloge began with Fontenelle (2 vols., Par. 1731), who was distinguished for clearness, ease, and elegance. His successors have tried to outshine him in pomp of language.

ELOHIM, Hebr., plural of *Eloâh*, Arab. *Ilâh*, Chald. *Elâh*, Syr. *Alôh*, might, power; in plur., intensified, collective, highest power—great beings, kings, angels, gods, *Deity*. As a *pluralis excellentiæ* or *majestatis*, and joined to the singular verb, it denotes, with very rare exceptions, *the One*, true God. Joined to the plural verb, however, it usually means gods in general, whether including the One or not. It is mostly used (in the singular sense) for or together with Jehovah (the Everlasting One); but some portions of the Scriptures employ exclusively either the one term or the other. This circumstance has given rise to endless discussions, and has also suggested amongst others the notion of different authors of Genesis. On this, and on the relation of those two words to each other, see the article JEHOVAH. We shall only mention here the hitherto unnoticed opinion of the Talmudists, that E. denotes the Almighty under the aspect of a God of strict justice; Jehovah, of clemency and mercy. As important for the history of the word E., we may add, in conclusion, that it was very probably Petrus Lombardus who first tried to prove the Trinity out of this plural form—an attempt which, although unanimously and scornfully rejected by all scholars, from Calvin, Mercerus, Calixtus, the younger Buxtorf, etc., to our times, has lately been revived by Rudolf Stier, who has gone so far as to invent a new grammatical term, "*Pluralis Trinitatis*," for this purpose. See also the articles SHEMITIC PLURAL and PENTATEUCH.

ELONGA'TION, ANGLE OF, is the angle measuring the distance between two stars, as seen from the earth. Usually, it is employed only in speaking of the distance of planets from the sun; the word "distance" being used instead of the word E., in regard to fixed stars and planets, as related to one another.

ELOPEMENT. See ADULTERY.

ELOQUENCE is the oral or written expression of thoughts and truths in a manner adapted to convince or persuade hearers or readers, and excite them to corresponding action. In its highest form it is inspired by an earnest love of truth and right, and a hearty scorn for whatever is base and false. An unrighteous cause may be defended with consummate skill, but not eloquently in the best sense of the word. The finest examples of eloquence—those which, through generations, have kept their place in the world's admiration, and which time can never destroy—are the utterances of men devoted to the truth and to the welfare of the human race. Emerson used to say that eloquence was "dog-cheap" in the antislavery meetings; if so, it must have been because those who spoke were inspired by a love of human freedom, and were conscious that they had a great and just cause. The great orators of antiquity were Demosthenes and Cicero. England in modern times has had her Pitt, Burke, Fox, and Sheridan, and now has her Gladstone and Bright. Ireland has a long line of men whose eloquence has moved the heart of nations, among them Grattan, Phillips, and O'Connell. In many of the European nations the growth of eloquence has been checked by causes originating in their political institutions and social habits. Among the names of great orators in France, that of Mirabeau is the most conspicuous. In the records of pulpit eloquence France presents among others the names of Bossuet, Massillon, Lacordaire, Lamennais, and Hyacinthe. The history of the United States is illustrated by eloquence at every step. James Otis, Fisher Ames, and Patrick Henry are names belonging to the period of the revolution. Since that day we have had Webster, Clay, Calhoun, Wirt, and Choate. In pulpit eloquence the country has been and is still rich. Among many eminent names in this department may be mentioned Samuel Davies, John Mason, Lyman Beecher, William Ellery Channing, Orville Dewey, Edwin H. Chapin, Henry Ward Beecher, Stephen H. Tyng, sr., and Richard S. Storrs.

EL PASO, a co. in central Colorado, on the head-waters of the Arkansas river, intersected by the Denver and Rio Grande railroad; 2,800 sq.m.; pop. '70, 987. The surface is rough and the soil fertile; productions chiefly agricultural. Pike's Peak, so long known as a guide-post for travelers over the plains, is one of its features. Co. seat, Colorado Springs.

EL PASO, the extreme w. co. of Texas, on the Rio Grande, and the New Mexico border; 9,450 sq.m.; pop. '70, 3,761—306 colored. Nearly the whole of the co. is sandy and barren, but there is some moderately good soil along the valley of the Rio Grande. Co. seat, El Paso.

EL PA'SO DEL NOR'TÉ (in English, *the Pass of the North*) is a narrow valley of 9 or 10 m. in length, near the north-eastern extremity of the republic of Mexico. It is situated within the state of Chihuahua (q.v.), in lat. 31° 42' n., and long. 106° 40' w., being on the right bank of the Rio Grande, or Rio Bravo del Norte, about 1420 m. from its mouth. It is remarkably fertile, yielding, in particular, considerable quantities of wine and brandy.

It contains about 5,000 inhabitants, nearly all of them of mixed blood. In fact, the people are little better than the aboriginal savages, being almost destitute of the most ordinary appliances of civilized life. The place is worthy of notice chiefly as the main thoroughfare between New Mexico and Mexico proper.

EL'PHIN, a bishop's see in Ireland, united to Kilmore in 1833.

ELPHINSTONE, The Honorable MOUNTSTUART, 1779–1859· an English statesman. He was sent when but 17 years old by the East India company to Calcutta, became assistant to the British resident at Poonah in 1801, and later to sir Arthur Wellesley, to whom he acted as aid on the outbreak of war, and after the war was appointed resident at Nagpore. In 1808, he was envoy to the Afghan capital, Cabul, and in 1811 resident at Poonah. On the renewal of hostilities in 1817, he assumed command of the English troops during the battle of Kirkee, and contributed largely to their success. He subsequently governed the conquered districts with remarkable force and considerateness, preserving the native customs and rights, so as to win the regard of his subjects, and strengthen British rule. In 1820–27, he was lieutenant-governor of Bombay, and drew up the Elphinstone code. He is regarded as the founder of state education in India. He was twice offered the governor-generalship of India, but declined. His last 30 years were devoted to study and authorship. He wrote *An Account of the Kingdom of Cabul and its Dependencies in Persia and India*, and a *History of India*. Both are standard authorities.

EL'PHINSTONE, WILLIAM, a celebrated Scottish prelate, and founder of King's college, Aberdeen, was b. in the year 1430 or 1431. He was the son of William Elphinstone, rector of Kirkmichael, and archdeacon of Teviotdale, and, as the marriage of ecclesiastics was then prohibited, his birth was illegitimate. E. studied at the university of Glasgow, where he took his degree of M.A. at the age of 24, at the same time that he took priest's orders. He seems to have acted as his father's curate at Kirkmichael for four years, but being strongly attached to the study of law (he had practiced as an advocate in the church courts before this), he went to France in his 29th year, at the instigation of his uncle, Laurence Elphinstone, who supplied him with the means of studying at the most celebrated schools of the continent. E. so highly distinguished himself, that after three years he was appointed professor in the university of Paris, and afterwards at Orleans, which had then the highest reputation as a legal school. So greatly were his learning and talents appreciated, that the parliament of Paris used to ask his opinion on great questions. After a residence of nine years abroad, he returned to Scotland, and was made successively official-gen. of the diocese of Glasgow (1471–72), rector of the university (1474), and official of Lothian in 1478, "then probably," says Mr. Cosmo Innes (*Sketches of Early Scottish History*, Edin. 1861), "the second judicial office in the kingdom, which he filled for two years, sitting in parliament, and serving on the judicial committees, which formed the supreme civil jurisdiction in Scotland." His dignity, learning, and prudence now began to procure him universal respect. He was the principal member of a great embassy sent from Scotland to France, to settle certain disputes that had sprung up between the two countries, and threatened the stability of their ancient alliance. In this important affair, he was eminently successful. On his return, he was made bishop of Ross in 1481. In 1483, he was removed to the see of Aberdeen; and between this period and the death of James III. he was several times engaged in embassies to France, England, Burgundy, and Austria. For a few months before the death of that monarch, he held the office of chancellor of the kingdom. He lost this great office on the accession of James IV., but, says the authority already quoted, "he was speedily restored to favor, and to the royal councils, and seems to have been keeper of the privy seal from 1500 till his death." He did not suffer his office to withdraw him from the care of his diocese, where he applied himself to the faithful discharge of his episcopal functions, endeavoring to reform the clergy, the service, and the ritual of his church. He next concluded (while on a mission to the continent for another purpose) a treaty with Holland, which was beneficial to Scotland. E. seems to have had a genuine desire for the enlightenment and improvement of his countrymen. Whenever leisure permitted, we find him engaged in devising means to this end. It appears to have been chiefly through his influence that the first printing-press —that of Chepman and Miller—was established in Scotland. He superintended the preparation and printing of the *Breviary of Aberdeen*, and collected the materials for the lives of the Scottish saints contained in that work. He procured from the pope (Alexander VI.) a bull for erecting a university in Aberdeen. The bull was sent in 1494, but the college was not founded till 1500, when it was dedicated to St. Mary—a name afterwards changed to King's college. E. built also the great central tower and wooden spire of his cathedral church at Aberdeen, provided its great bells, covered the roofs of its nave, aisles, and transept with lead; and, at his own expense, built a stone bridge over the Dee for the benefit of his townsmen. The fatal battle of Flodden, 9th Sept., 1513, broke the spirit of E., who was never seen to smile after. He died 25th Oct., 1514, and was buried before the high altar of the chapel of the college which he founded. E. was a man of great vigor of mind and nobleness of nature—"one of those prelates," says a writer in the *Quarterly Review* (No. clxix., p. 141), "who in their munificent acts, and their laborious and saintly lives, showed to the Scottish church, in her

corruption and decay, the glorious image of her youth." "We know him," says Mr. Innes, "in the history of the time as the zealous churchman, the learned lawyer, the wise statesman; one who never sacrificed his diocesan duties to mere secular cares, but knew how to make his political eminence serve the interests of his church; who, with manners and temperance in his own person, befitting the primitive ages of Christianity, threw around his cathedral and palace the taste and splendor that may adorn religion, who found time, amidst the cares of state and the pressure of daily duties, to preserve the Christian antiquities of his diocese, and collect the memories of those old servants of truth who had run a course similar to his own; to renovate his cathedral service, and to support and foster all good letters, while his economy of a slender revenue rendered it sufficient for the erection and support of sumptuous buildings and the endowment of a famous university." Some volumes of notes made by E. when studying in the law schools, are preserved in the library of the university of Aberdeen. A transcript of Fordun's *Scotichronicon*, with some additions, in the Bodleian library at Oxford, was long erroneously ascribed to him. His *Breviarium Aberdonense*, printed in 1509–10, was reprinted in two vols. 4to at London in 1853.

EL ROSARIO, a small t. of the Mexican confederation in the state of Cinaloa, is situated 55 m. e.n.e of Mazatlan. It is important chiefly as being a commercial entrepôt between Mazatlan and the interior. Pop. 5,000.

ELSASS AND ELSASS-LOTHRINGEN. See ALSACE, *ante*.

ELSINORE' (Dan. *Helsingör*), a t. and seaport of Denmark, on the island of Seeland, is situated on the western shore of the sound, and at its narrowest part, 3½ m. w.s.w. of the town of Helsingborg in Sweden, and 24 m. n. of Copenhagen. Lat. 56° 2′ n., long. 12° 36′ east. The town, which has been in recent times considerably improved, is spacious, and consists of one long principal street, with several lateral branches. The cathedral, containing some fine tombs, many of them very old, may be considered as one of the most interesting edifices. At a short distance to the e. of E. are the castle and the fortress of Kronborg, the former a white stone building in the Gothic style, and the latter, a stronghold mounted with guns that command the sound in all directions. To the n.w. of E., and in its immediate vicinity, is the royal château of Marienlist, the pleasure-grounds of which, occupying the crest of a hill, are open to the public. From the grounds of Marienlist, magnificent views may be had of the sound, of Helsingborg, and of the plains of Sweden. The harbor of E., formed by a wooden pier, is accessible to ships of light draught. E. has a brisk foreign trade, and has, besides, manufactures of straw-hats, arms, sugar, brandy, etc., also cotton-printing and fisheries. The sound dues (q.v.) were collected here. Pop. '70, 8,891.

Saxo Grammaticus, a famous writer of the 12th c., was born here. Here Shakespeare laid the scene of his *Hamlet*, a perversion of history on the part of the great dramatist, as Jutland, not Seeland, was Hamlet's country. The vaults under the castle of Kronborg were supposed to be the residence of Holger Danske, the mythic hero of Denmark, who never appeared above ground save when the country was in danger, and was then supposed to march at the head of the Danish armies. In severe winters the sound is frozen over at E., so that one can walk over the ice from Denmark to Sweden.

ELSSLER, FANNY, a celebrated dancer, was b. at Vienna in the year 1811, and educated at Naples for the ballet, along with her elder sister Theresa. The first triumph of the sisters took place at Berlin, where they appeared in 1830. The reputation acquired by Fanny in Berlin preceded her to France, America, England, and St. Petersburg, where her beauty, amiability, and mastery in her art, charmed all classes of society. In 1841, the two sisters went to America, where they excited unwonted enthusiasm. After Fanny had earned laurels in St. Petersburg, she returned, in 1851, to Vienna, to take a final leave of the stage. She then retired to Hamburg, where she remained, till in 1854 she settled finally in Vienna. Theresa was less graceful in her motions than her sister, but exhibited great strength, boldness, and agility. On the 25th April, 1851, she became the wife of prince Adalbert of Prussia (who died in 1873), and was ennobled by the king of Prussia.

ELSTER, the name of two rivers of Germany, the white and the black Elster. The white E. rises at the foot of the Elster mountains, on the n.w. boundary of Bohemia, flows in a northerly direction, and falls into the Saale 3 m. s. of the town of Halle, in Prussia. Its chief affluent is the Pleisse from the right. Total length, 165 miles. The black E. rises in the kingdom of Saxony, within 2 m. of Elstra, flows n.w., enters Prussia, and joins the Elbe 8 m. s.e. of Wittenberg. Length, 130 miles.

ELSTRACKE, REGINALD or RENOLD, an English engraver, who flourished about 1620. He worked chiefly for the booksellers, and his plates, which are executed with the graver, without etching, are almost entirely confined to portraits. Prints from his plates are much sought after, not only from their scarcity, and as illustrating English history, but as works of art, in which much character is expressed in a firm and forcible manner. When he did not sign his plates with his name, he marked them with his initials, R. E.

ELTON, a famous salt lake of Russia, is situated in the government of Saratov, 170 m. s.s.e. from the town of that name, the lat. of its center being 48° 56′ n., and the long. 46° 40′ east. Its longest diameter is 11 m., and its shortest about 9 miles. It has a superficial extent of 45,500 English acres, but at no place is it more than about 15 in. in depth. It is of an oval form, and can be easily reached from the s., but the northern bank rises so rapidly that access to it from that quarter is difficult. In the hottest season, so wonderful is the illusion produced by the crystallized salt, that the lake seems covered with snow and ice. E. yields about 100,000 tons of salt annually, in the collection of which about 10,000 persons are employed.

ELUTRIATION is the term applied to the process of separating, by means of water, the finer particles of earths and pigments from the heavier portions. The apparatus generally used is a large vat, in which grinding wheels revolve, and the substance to be reduced to powder being placed in the vat along with water, the wheels in revolving not only pulverize the material, but from their motion being communicated to the water, the latter is enabled to retain in mechanical suspension the finer particles of the clay, etc. By allowing a stream of water to flow in and out of the vat, the finer particles can be constantly floated away, and the liquid being run into settling vats, the fine powder settles to the bottom, when the water can be run off from the surface. This process is much employed in the manufacture of the materials used in pottery, and in the preparation of pigments.

ELUTRIATION (from a Latin word meaning "to cleanse"), an operation for preparing clay for porcelain manufacture, and for glazing earthenware, and for other purposes. Different forms of apparatus are used; some employ vats containing grinding wheels, others only wheels for stirring; but a simple deep vat or hogshead will answer the purpose on a small scale, the stirring being done by hand, with a rod or paddle. The earth or clay being mingled with sufficient water to make it quite thin, is stirred and allowed to stand, till the coarser particles are precipitated. The finer particles, suspended in the water, may then be drawn off (a siphon may be used with advantage), and after they have subsided, may be collected. The process for filtering water in reservoirs supplying cities by which it is made to pass over and under diaphragms, so that both light and heavy impurities are separated, is a process of filtration by elutriation. Elutriation on a grand scale is exhibited by nature in the deposit of fine earths. The immense beds of fine potter's clay and kaolin covering many square miles in area, are the result of the slow subsidence of fine particles suspended in water passing in a slow but steady current in estuaries. The streams from the land carry down the turbid products of rain, depositing at first coarse gravel, then finer gravel, then coarse and fine sand, all the particles pursuing an oblique descent, more and more approaching the horizontal, till at last the impalpable particles of fine clay are slowly deposited over vast areas.

EL'VANS are veins of a granular crystalline mixture of felspar and quartz, probably proceeding from a granite mass, which are found in granite rocks and fossiliferous slates in Cornwall, Devon, and the s. of Ireland.

EL'VAS, an episcopal city and fortress of Portugal, stands in a very fruitful district on the eastern frontier of the province of Alemtejo, 10 m. w. of Badajoz, and 40 m. n.e. of Evora. It is the strongest fortress in Portugal, and one of the strongest in Europe. It is built upon a precipitous hill; is surrounded by walls, and by a glacis and covered-way. Besides these, E. has other defenses in two formidable forts, fort Sta. Lucia, and fort Lippe, the former to the s., and the latter—almost entirely shell-proof—to the n. of the city. E. is an old town; many of its houses are badly built. Its most striking architectural feature is an enormous aqueduct, which conveys water to it from a distance of 3 miles. This aqueduct consists of four tiers of arches built upon one another, and rising to the height of about 250 feet. The chief manufactures of E. are arms and jewelry. There are here extensive store-houses filled with British manufactures, and the inhabitants, by illegally selling these goods within the Spanish frontier, realize considerable wealth. Pop. 18,510.

E. has undergone may sieges, but has never been taken. The Spaniards besieged it in 1385, and again in 1659, when a famous battle took place called the Lines of Elvas, in which the Portuguese, through greatly inferior in numbers, drove the Spaniards from their lines in front of the town. E. was raised to the rank of a city by D. Manoel, king of Portugal, in 1513.

ELVES. See FAIRIES.

E'LY, so called from a Saxon word, *elig*, an eel, or *helig*, a willow, may be called a cathedral town rather than a city, and is situated on an eminence in that part of the fen-country of Cambridgeshire called the *Isle of Ely*. Pop. '71, 8,166. The Eastern Counties and the Great Northern railways have each stations, the former outside, the latter in the town.

Ely Cathedral.—About the year 673, Etheldreda, daughter of the king of East Anglia, and wife of Oswy, king of Northumberland, founded a monastery here, and took on herself the government of it. Two hundred years afterwards (870), the Danes ravaged the Isle, and destroyed the monastery, which was rebuilt in 970 by St. Ethelwold, bishop

of Winchester; and this continued till 1081, when a new church was begun, which was converted into a cathedral, and the abbey erected into a see in 1109. The possessions of the abbey were divided between the bishop and the community. The cathedral contains some beautiful specimens of architecture, especially of early Norman. Its exterior dimensions are 535 ft. from w. to east. The great cross or main transept is 190 feet. The turrets of the w. tower are 215 ft. high, and the lantern over the central tower 170 feet. The w. front was built by Geoffry Ridel, the third bishop, who died in 1189, and is of Norman work. About 200 years after his time, an addition of 64 ft. was made to the tower, and over that a spire. This great superincumbent weight crushed the n.w. transept, and the s.w. one, which still remains, was considerably weakened. In front there is a w. portico or galilee (q.v.), of early Gothic, said to be the work of bishop Eustachius. The nave is of Norman work, and was completed about 1174. The columns are alternately round and octagonal. The roof was, in 1861, beautifully painted. The transepts, which are the most ancient parts of the church, were built in the reign of Henry I. They had originally a middle and two side aisles, but the latter are, in the s. transept, walled up, and the space used as a vestry and library. Originally there stood a square tower in the center of the building, opening into the nave and transepts; but this gave way in 1322, and fell eastwards, crushing three arches of the choir. The repair of this dilapidation was undertaken by the sacrist of that time, Alan de Walsingham. The design was original, an octagon tower with four longer and four shorter sides, surmounted by a lantern. The upper part of this, which is of timber, has recently been rebuilt.

The choir contains some rich varieties of decorated Gothic, and the fine shafts of Purbeck marble combine beautifully with the white stone-work. The whole has lately been restored and beautified. Originally, it was much shorter eastwards, and protruded into the nave, but in 1235 the semicircular end of the old church was taken down, and six arches added by Hugh de Northwold. At the dedication and removal of the relics, Henry III. and his court were present. The e. end is eminently beautiful: it consists of two tiers of high lancet-shaped windows. Perhaps the most interesting and yet beautiful part of the building is the Lady chapel—an incomparable work, irreparably spoiled by the barbarism of Puritan times. It was begun in 1321, and finished in 1349, simultaneously with the rebuilding of the central tower and ruined choir, a circumstance highly illustrative of the taste and munificence of the times. It has a stone roof, like King's college chapel in Cambridge, which it is supposed to have suggested, and the walls were once decorated from top to bottom with countless niches and images of saints and martyrs, not one of which remains undefaced. Its length is 100 ft.; width, 46; height, 60. Bishop Alcock's chapel, in which he lies buried, is at the e. end of the n. aisle—an overloaded specimen of the richest florid Gothic. Bishop West's chapel, at the e. end of the s. aisle, is a more pleasing example of the same style.

Amongst the celebrated names connected with E. are abbot Thurstan, who defended the isle against William the conqueror for seven years; Longchamp, chancellor and regent under Richard I.; chancellor Morton, Simon Patrick, and bishop Andrews. The bishops of E., like the bishops of Durham, formerly enjoyed a palatine jurisdiction, and appointed their own chief-justice, etc.; but this privilege was taken from them by the 6th and 7th Will. IV. The bishop of E. is visitor to St. Peter's, St. John's, and Jesus colleges, Cambridge, of which last he also appoints the master. There is a grammar-school attached to the cathedral, founded by Henry VIII. There are some interesting remains of the old conventual buildings in the neighborhood of the cathedral.

ELY, Isle of, the s. part of the Bedford Level, or the part of Cambridgeshire n. of the Ouse. It includes above a half of this county, is 24 m. long from n. to s., with an average breadth of 14 m., and contains four hundreds. It consists of a monotonous, marshy, or fenny plain, formerly covered with water, and abounding in aquatic birds and plants. It chiefly consists of black earth and turf, and, where well drained by innumerable artificial canals and ditches, it produces fine crops of hemp, flax, wheat, oats, and cole-seed. Over it are interspersed small eminences, generally crowned with villages and towns, as Ely City, March, Thorney, Whittlesea, and Wisbeach. Pop. about 60,000.

ELYMAIS, an ancient province on the Persian gulf, supposed to have been a district of Elam (q.v.), though the name is sometimes used as equivalent to Elam.

ELYRIA, the seat of justice of Loraine co., Ohio, on Black river, 7 m. s. of lake Erie, on the Lake Shore and Michigan Southern railroad, at the junction of the Sandusky and Norwalk divisions, and the crossing of the Lake Shore and Tuscarawas Valley railroads; pop. '70, 3,038. There is water-power furnished by Black river, and a number of important manufactories.

ELYSIUM (Gr. *elysion*), a place in the infernal regions of the ancient classical mythology, where the souls of the good dwell after death. In the *Odyssey*, Homer describes it as a place where the souls of the departed lived in ease and abundance among innocent pleasures, and enjoying a mild and wholesome air. In the *Iliad*, however, he gives a somber view of the state of the departed souls. Achilles, though in E., is made to envy the life of the meanest hind on earth. By succeeding poets, the bliss of E. is drawn

in much more lively colors. Besides the amenity and various delights of the place, diverse employments are found for the inhabitants, according to the ruling passion of each while on earth. E. was supposed by some writers to be in mid-air, by others in the sun, by others in the center of the earth, next Tartarus, by others in the Islands of the Blest.

ELZEVIER', or ELZEVIR, the name of a celebrated family of printers at Amsterdam, Leyden, and other places in Holland, whose beautiful editions were chiefly published between the years 1583 and 1680. Louis, the first of them, is said to have been born at Louvain about the year 1540. He was induced by religious disturbances to leave his native city, and in 1580, he settled as a bookbinder and bookseller in Leyden, where he died about 1617. The first work edited by him bears the title *Drusii Ebraicorum Quæstionum ac Responsionum Libri Duo, videlicet Secundus ac Tertius, in Academia Lugdunensi* MDLXXXIII. *Veneunt Lugduni Batavorum apud Elseuirium e Regione Scholæ Novæ.* The second, a Eutropius by P. Merula, bears the date 1592, and was long erroneously believed to be the first that issued from E.'s press. Five out of Louis' seven sons continued to carry on their father's business. Their names were Matthew, Louis, Aegidius, Jodocus (Joost), and Bonaventura. The last, in conjunction with his nephew Abraham E. (a son of Matthew), prepared the smaller editions of the classics, in 12mo and 16mo, which are still valued for their beauty and correctness. It is mainly on these that their reputation is based. The house of E., in Amsterdam, was established by Louis, the son of Jodocus E., in 1638. Peter E., grandson of the last mentioned, carried on the bookselling business in Utrecht, and died in 1696. For more than a century, however, this family has ceased to have any connection with book-printing. It is believed that 1213 works in all proceeded from the E. presses. Amongst the most beautiful are the editions of Pliny, Virgil, Livy, Tacitus, and Cæsar; and, though for Greek and Hebrew texts the house of E. was surpassed by that of Stephens (q.v.), their Latin classics are unrivaled both for beauty and correctness. It is said that the Elzeviers generally employed women to correct the press, under the conviction that they would be less likely than men, on their own responsibility, to introduce alterations into the text. Compare Adry, *Notice sur les Imprimeurs de la Famille des Elzeviers* (Paris, 1806), and Pieter's *Annales de l'Imprimerie Elsévirienne* (Ghent, 1851–52).

EMACIA'TION (Lat. *macies*), leanness. See CONSUMPTION, TABES DORSALIS.

EMANA'TION means, in general, efflux or issue. In theology and philosophy, it indicates an ancient doctrine, which considered all things as emanating or flowing from a supreme principle. According to this doctrine, the origin of things is only an overflowing of the divine fullness—an outstreaming of the light from the necessity of its nature, and not any free action on the part of God. What is thus given off as a copy from original perfection, departs more and more from its source, and gradually degenerates, which was thought to account for the origin of evil. This doctrine came from the east, and pervades the Indian mythology, the system of Zoroaster, and the Neo-Platonic philosophy of Alexandria. In Christian theology, the idea of E. has been applied to explain the relation among the persons of the Trinity.

EMANCHÉ. See MANCH.

EMANCIPA'TION. See SLAVERY.

EMANCIPATION, in the Roman law, was the act by which the *patria potestas* (q.v.), or paternal authority, was dissolved in the life-time of the father. It took place in the form of a sale (*mancipatio*) by the father or the son to a third party, who manumitted him. The Twelve Tables required that this ceremony should be gone through three times, and it was only after the third sale that the son became *sui juris* under his own law. In general, the son was at last resold to the father, who manumitted him, and thus acquired the rights of a patron (q.v.), which would otherwise have belonged to the alien purchaser who finally manumitted him. In the case of daughters and grandchildren, one sale was sufficient. If the child died intestate, or if he required a tutor or curator, the father's rights as patron came into play; but if the father died intestate, the son took nothing, because he was out of his family. But this rigor of the old law was modified by the prætor's edict, which placed all the children on the same footing. In the law of Scotland, E. is called forisfamiliation (q.v.). The only case in which the term is employed in England is with reference to poor-law settlements. See SETTLEMENT, POOR AND POOR-LAWS.

EMANCIPATION, CATHOLIC. See ROMAN CATHOLIC EMANCIPATION.

EMANCIPATION, PROCLAMATION OF. The document issued by Abraham Lincoln, president of the United States, Jan. 1, 1863, declaring the immediate freedom of the great majority of the slaves in the United States, and striking a death-blow at the whole system of American slavery in this country, for the purpose of putting an end to the rebellion then existing in the slave states and restoring the union on the basis of equal liberty for all men. For a long time president Lincoln hesitated, on constitutional grounds, to take this step, which he held to be within the power of the executive only as a measure of war. At length, however, a crisis arrived when he felt it to be not only a right but a duty to destroy the institution in which the rebellion had its roots, and

which had long been the great embarrassment and opprobrium of the republic. The document, in view of its purposes and effects, must ever hold an important place in the national annals.

PROCLAMATION.

Whereas, On the 22d day of Sept., in the year of our Lord 1862, a proclamation was issued by the president of the United States, containing among other things the following, to wit:

That, on 1st day of Jan., in the year of our Lord 1863, all persons held as slaves within any state, or any designated part of a state, the people whereof shall then be in rebellion against the United States, shall be thenceforward and forever free, and the executive government of the United States, including the military and naval authority thereof, will recognize and maintain the freedom of such persons, and will do no act or acts to repress such persons, or any of them, in any efforts they may make for their actual freedom:

That, the executive will, on the 1st day of Jan. aforesaid, by proclamation, designate the states and parts of states, if any, in which the people thereof respectively shall then be in rebellion against the United States, and the fact that any State, or the people thereof, shall on that day be in good faith represented in the congress of the United States by members chosen thereto at elections wherein a majority of the qualified voters of such state shall have participated, shall, in the absence of strong countervailing testimony, be deemed conclusive evidence that such state and the people thereof are not then in rebellion against the United States:

Now, therefore, I, Abraham Lincoln, president of the United States, by virtue of the power in me vested as commander-in-chief of the army and navy of the United States, in time of actual armed rebellion against the authority and government of the United States, and as a fit and necessary war-measure for repressing said rebellion, do, on this 1st day of Jan., in the year of our Lord 1863, and in accordance with my purpose so to do, publicly proclaim for the full period of 100 days from the day of the first above-mentioned order, and designate as the states and parts of states wherein the people thereof respectively are this day in rebellion against the United States, the following, to wit: Arkansas, Texas, Louisiana, except the parishes of St. Bernard, Plaquemines, Jefferson, St. John, St. Charles, St. James, Ascension, Assumption, Terre Bonne, Lafourche, St. Mary, St. Martin, and Orleans, including the city of New Orleans, Mississippi, Alabama, Florida, Georgia, South Carolina, North Carolina, and Virginia, except the 48 counties designated as West Virginia, and also the counties of Berkeley, Accomac, Northampton, Elizabeth City, York, Princess Ann, and Norfolk, including the cities of Norfolk and Portsmouth, and which excepted parts are, for the present, left precisely as if this proclamation were not issued.

And by virtue of the power and for the purpose aforesaid, I do order and declare that all persons held as slaves within said designated states and parts of states are, and henceforward shall be, free; and that the executive government of the United States, including the military and naval authorities thereof, will recognize and maintain the freedom of said persons,

And I hereby enjoin upon the people so declared to be free, to abstain from all violence, unless in necessary self-defense, and I recommend to them, that in all cases, when allowed, they labor faithfully for reasonable wages.

And I further declare and make known that such persons of suitable condition will be received into the armed service of the United States to garrison forts, positions, stations, and other places, and to man vessels of all sorts in said service.

And upon this, sincerely believed to be an act of justice, warranted by the constitution, upon military necessity, I invoke the considerate judgment of mankind and the gracious favor of Almighty God.

In witness whereof, I have hereunto set my hand and caused the seal of the United States to be affixed.

[L.S.] Done at the city of Washington, this 1st day of Jan., in the year of our Lord 1863, and of the independence of the United States of America the 87th.

By the president: ABRAHAM LINCOLN.

WILLIAM H. SEWARD, secretary of state.

The work of emancipation in the United States was completed at the adoption of article XIII. of the amendments to the constitution, and the reconstruction of the states in rebellion upon that basis. (See SLAVERY, *ante*).

EMANUEL, a co. in e. central Georgia, s.e. of Ogeechee river; 950 sq.m.; pop. '70, 6,134—1703 colored. The surface is level and largely covered with pine forests; soil sandy, and not very productive. Cotton, corn, and pork are produced. Co. seat, Swainsborough.

EMAN'ÜEL I., King of Portugal, styled THE GREAT, and sometimes, likewise, THE FORTUNATE, was b. on the 3d May, 1469, and succeeded John H. in 1495. Before his accession to the throne, he bore the title of duke of Beja. On his accession, he prepared the code of laws which bears his name, and rendered himself remarkable by his zeal and exertions in the cause of education, by his active piety, and by his predilection for the society of artists and scholars. Through his exertions, Portugal became the

first naval power of Europe, and the center of the commerce of the world. He despatched Vasco da Gama to sail round the cape of Good Hope, and discover the passage to India. Cabral was commissioned by him to prosecute the discoveries of Vasco da Gama still further, and Corte Real to sail along the coasts of North America. The expeditions under Albuquerque put E. in possession of the s. coast of Africa and of the Indian archipelago. Not satisfied with this, he opened a communication with Persia, Ethiopia, and, in 1517, with China. At his death, 13th Dec., 1521, Portugal was in possession of a large fleet, strong fortresses, well-furnished arsenals, a warlike army, a flourishing trade and commerce, and extensive colonies. His reign has been termed the golden age of Portugal. E. was thrice married: first to Isabella, the daughter of Ferdinand; afterwards to Mary of Castile, her sister (by whom he had two children, John and Isabella, the former of whom succeeded him on the throne); and thirdly, to Eleanore of Austria, sister of Charles V.

EMARGINATE. See LEAVES.

EMBA, a river of Turkistan, in the Kirghiz territory, rises at the western base of the Muchajar or Mongojar mountains, and flowing in a s.w. direction, enters the Caspian sea after a course of about 300 miles.

EMBALMING, the art of preserving the body after death, invented by the Egyptians, whose prepared bodies are known by the name of mummies, and are called in the hieroglyphs *sahu*, and by St. Augustine *gabbaroe*. This art seems to have derived its origin from the idea that the preservation of the body was necessary for the return of the soul to the human form after it had completed its cycle of existence of three or ten thousand years. Physical and sanitary reasons may also have induced the ancient Egyptians; and the legend of Osiris, whose body, destroyed by Typhon, was found by Isis, and embalmed by his son Anubis, gave a religious sanction to the rite, all deceased persons being supposed to be embalmed after the model of Osiris in the *abuton* of Philæ. The art appears as old as 2000 B.C., at least the bodies of Cheops, Mycerinus, and others of the age of the 4th dynasty having been embalmed. One of the earliest recorded embalmments on record is that of the patriarch Jacob; and the body of Joseph was thus prepared, and transported out of Egypt. The process has been described by Herodotus and Diodorus; but their accounts can only refer to their own age, and are only partially confirmed by an examination of the mummies. The following seems to have been the usual rule observed after death. The relations of the deceased went through the city chanting a wail for the dead. The corpse of a male was at once committed into the charge of the undertakers; if a female, it was retained at home till decomposition had begun. The *paraschistes*, or flank-inciser of the district, a person of low class, whose establishment was situated in the cemeteries or suburbs, conveyed the corpse home. A scribe marked with a reed-pen a line on the left side beneath the ribs, down which line the paraschistes made a deep incision with a rude knife or Ethiopian stone, probably flint. He was then pelted by those around with stones, and pursued with curses. Another kind of embalmer, the *tarichcutes*, or preparer, then proceeded to remove the entrails and lungs, with the exception of the heart and kidneys. The brain was extracted by another tarichcutes, by a crooked instrument, through the nose. All this having been effected, the body was ready for the salts and spices necessary for its preservation, and the future operations depended upon the sum to be expended on the task. When Herodotus visited Egypt, three methods prevailed: the first, accessible only to the wealthy, consisted in passing peculiar drugs through the nostrils into the cavities of the skull, rinsing the belly in palm-wine, and filling it with resins, cassia, and other substances, and stitching up the incision in the left flank. The mummy was then steeped in natron for seventy days, and wrapped up in linen, cemented by gums, and set upright in a wooden coffin against the walls of the house or tomb. This process cost a silver talent, which, considering the relative value of ancient money at one third of that at present, would amount to about £725. The second process consisted in removing the brain, as before, but only injecting the viscera with *kedrion*, or cedar oil, and soaking the corpse in a solution of natron for seventy days, which brought away or destroyed the viscera and soft portions, leaving only the skin and bones. The expense was a *mina*, relatively worth about £243. The third process, in use for the poorer classes, washed the corpse in myrrh, and salted it for seventy days. The expense was a trifle, not mentioned. When thus prepared, the bodies were ready for sepulture, but were often kept some time before being buried—often at home—and even produced at festive entertainments, to recall to the guests the transient lot of humanity. When buried, they were sent to the *cholchytæ*, a higher class than the *tarichsutæ*, who had charge of the tombs, the mummies, and the masses for the dead. All classes were embalmed, even malefactors; and those who were drowned in the Nile or killed by crocodiles received an embalmment from the city nearest to which the accident occurred. As the art, however, existed for many centuries, it may be easily conceived that mummies were preserved by very different means, and quite distinct from those described by classical authors, some having been found merely dried in the sand; others salted by natron, or boiled in resins and bitumen, with or without the flank incision, having the brains removed through the eyes or base of the cranium, with the viscera returned into the body, placed upon it, or deposited in jars in shapes of the genii of the dead, the skin

partially gilded, the flank incision covered with a tin plate, the fingers cased in silver, the eyes removed, and replaced. The mummies are generally wrapped in linen bandages, and placed in costly coffins. See SARCOPHAGUS. The sacred animals were also mummied, but by simpler processes than men. Mummies, it may be observed in passing, were used in the 15th and 16th centuries of the Christian era for drugs and other medical purposes, and nostrums against diseases, and a peculiar brown color, used as the background of pictures, was obtained from the bitumen. The Ethiopians used similar means to preserve the dead, and the successful nature of embalming may be judged from the numerous mummies in the different museums of Europe. Other less successful means were used by nations of antiquity to embalm. The Persians employed wax; the Assyrians, honey; the Jews embalmed their monarchs with spices, with which the body of our Lord was also anointed; Alexander the great was preserved in wax and honey, and some Roman bodies have been found thus embalmed. The Guanches, or ancient inhabitants of the Canary isles, used an elaborate process like the Egyptians; and desiccated bodies, preserved by atmospheric or other circumstances for centuries, have been found in France, Sicily, England, and America, especially in Central America and Peru. The art of embalming was probably never lost in Europe; and De Bils, Ruysch, Swammerdam, and Clauderus boast of great success in the art. There was a celebrated cabinet of M. De Rasière in 1727, containing prepared bodies; and the mode of embalming princes and others, by prepared balms and other substances, is detailed by Penicher, consisting in the removal and separate embalmment of the heart and viscera, and removing the brain, and introducing the preparations by incisions all over the body. Dr. Hunter injected essential oils through the principal arteries into the body. Boudet, during the French empire, embalmed the bodies of the senators with camphor, balsam of Peru, Jews' pitch, tan and salt; but the discovery of Chaussier of the preservative power of corrosive sublimate, by which animal matter becomes rigid, hard, and grayish, introduced a new means of embalming by Beclard and Larrey; but owing to the desiccation the features do not retain their shape. The discovery of the preservative power of a mixture of equal parts of acetate and chloride of alumina, or of sulphate of alumina, by Bannal in 1834, and of that of arsenic by Tranchini, and of pyroxilic spirits by Babington and Rees in 1839, and of the antiseptic nature of chloride of zinc, have led to the application of these salts to the embalming or preparation of bodies required to be preserved for a limited time; but there is no reason to believe that bodies so preserved will last as long as Egyptian mummies. See Pettigrew, *History of Mummies* (4to, Lond. 1834); Gannal, *Traité d'Embaumement* (8vo, Paris, 1838), translated by Harlan (8vo, Philadelph. 1840); Magnus, *Das Einbalsamiren der Leichen* (8vo, Braunsch. 1839).

EMBANKMENT, EARTHWORK. Embankments, in engineering, are masses of earth, rock, or other materials artificially formed, and rising above the natural surface of the ground. They are chiefly formed either (1) to carry railways, common roads, canals, etc., over depressions of the country; or (2) for hydraulic purposes, such as the formation of reservoirs for storing water; or as defenses against the overflowing of rivers, the encroachments of the sea, of lakes, etc.

In the formation of canals, railways, and other roads, embankment and *excavation* go hand in hand, and, under the name of EARTHWORK, form—especially in modern times, and since the development of the railway system—a vast branch of industry, giving employment to many thousands of laborers, known in England as "navvies." The earthworks executed within the last quarter of a century in Great Britain alone have cost many millions of pounds.

In planning works of the kind alluded to, engineers follow, as much as possible, the principle of making the cuttings or excavations and the embankments balance; i.e., of making the earth, etc., taken from the cuttings be sufficient for the formation of the embankments. See RAILWAYS (ENGINEERING). In proceeding to the actual construction of a railway embankment, e.g., a beginning is made at the points where the level of the formation meets the surface of the ground; and on each side of these points the cutting is taken out, and the embankment formed by men using pick, shovel, and barrow, so that a roadway is formed for a distance of from 50 to 100 yards. When the "lead," or the distance between the face of the cutting and the "tip-head," or end of the embankment, is greater than this, it is no longer economical to use the barrow. To continue the cutting and embankment, several methods may be employed; the most common are dobbin carts; small wagons run upon light rails at a narrow gauge, and drawn by men or horses; ordinary earth-wagons drawn by horses, and occasionally by a locomotive; and, lastly, ballast-wagons or trucks drawn by a locomotive. The cost of earthwork naturally varies greatly with the nature of the strata in which the cutting has to be made, the length of the "lead," and other circumstances. When rocks have to be cut through, blasting (q.v.) is had recourse to. One of the points on which considerable doubt existed was as to the inclination of the side-slopes of embankments; but it has been found that nearly all kinds of earthwork will stand at an inclination of 1½ horizontal to 1 vertical. When, however, it is necessary to use very wet substances, such as peat-moss or wet clays, or when the embankment is of great height, a flatter slope may be necessary. In many cases, it is advisable to substitute a viaduct (q.v.) for

an embankment. All embankments put in as above mentioned subside more or less, the subsidence being much more distinctly perceptible in clay than in gravel. When clay is thrown by the wagon over a considerable tip, the lower half of the embankment will be seen to consist of round bullets of clay of sufficient hardness to resist being squeezed into one mass by the weight of the embankment, until, in the course of time, from the effects of moisture, they become gradually disintegrated, and a settlement or sinking of the embankment takes place, sometimes to the extent of a twelfth, or even a tenth of the height. The greatest sinking usually occurs during the first wet weather after the formation of the embankment; but it sometimes goes on, though more and more slowly, for years. In the case of railway embankments, this subsidence is seldom of very material importance. If the permanent rails are laid, the labor and expense of restoring them to the level is not great, and the embankment should always be formed sufficiently wide at the top to allow of filling it up to its proper level without adding to the slopes. It is, however, practicable, though rather hazardous, to widen it at the top afterwards by cutting trenches in the slopes.

When the side-slope of the ground on which an embankment is to be formed is very steep, the whole work has a tendency to slip laterally; and to prevent this, trenches or steps are cut in the ground before putting in the embankment. When the material is very wet, it sometimes is impossible to prevent the slopes from bulging out, in which case it is generally sufficient to put in additional stuff until the work stands. Peat-moss is seldom used to form an embankment, but frequently an embankment has to be formed where the ground below is moss to a considerable extent. In this case, many plans have been adopted to form a substantial, unyielding work, which, where the moss is deep, and contains much water, is often very troublesome and expensive. Among these, perhaps, in most cases, the best is to continue throwing in earth until no further subsidence takes place. In some cases, piling has been adopted, and in others, a layer of tree-tops and brushwood has been placed on the moss under the embankment. When this is done, it frequently happens that the ground on each side of the embankment opens in great rents, rises to a considerable height, and moves laterally from the embankment. A good example of this may be seen on the Scottish Central railway, a short distance to the s. of the Bridge of Allan station.

Embankments, when finished, have their side-slopes usually covered with soil and sown with grass-seed; this not only improves their appearance, but adds considerably to their stability, preventing rain and wind from doing the damage that might otherwise take place.

In regard to embankments to restrain or prevent the encroachment of water, it is necessary, in addition to forming them of sufficient height and strength, to cover the surface of the slopes in such a way that the action of the water will not affect it. Of course the method adopted must depend entirely on the nature of the case; where, for example, the water only occasionally touches the embankment, as in the case of river-floods, and does not run with great violence along it, good turf pinned to the slopes has been found effectual. Where, however, the slopes are subject to the action of waves or rapid water, more effectual and expensive measures must be adopted, such as stone-pitching, piling, etc. Embankments of this nature are used on a great scale in Holland. See DYKE.

Embankments for damming up water so as to form ponds or reservoirs, require, in addition to the other conditions, to be perfectly water-tight; and for this purpose a "puddle-wall" of clay is carried from top to bottom in the heart of the structure. The great difficulty lies in preventing the water from finding its way between the bottom of the puddle-wall and the foundation on which it rests, or even through the substances of which that foundation consists; and the wall must often be carried to a great depth below the surface of the ground until an impermeable stratum be found. A knowledge of the geology of the place is here essential to the engineer.

EMBARGO (from the Spanish *embargar*, to in-bar, to arrest) is a temporary order from the admiralty to prevent the arrival or departure of ships. It may apply to vessels and goods, or to specified goods only; it may be general or special; it may apply to the entering only, to the departure only, or to both entering and departure of ships from particular ports; and lastly, although issued by the admiralty in this country, it would be equally an embargo if issued by any other competent authority. Such embargoes are generally connected in some way or other with a state of war between two countries.

EMBASSY. In a popular sense, all diplomatic missions are spoken of as embassies, but such is not the technical meaning of the term. In its more limited acceptation, embassy is a mission presided over by an ambassador, as distinguished from a mission or legation intrusted to an envoy, or other inferior diplomatic minister. In this stricter sense, Great Britain has now only four embassies—those at Paris, Vienna, St. Petersburg, and Constantinople. The only difference between the powers and privileges of the ambassador and the envoy is, that the former represents the person of his sovereign, and in this capacity he can demand a private audience of the sovereign to whom he is accredited; whilst the latter must address himself to the minister for foreign affairs. A residence is provided for the ambassador, and an allowance for house-rent is made to inferior ministers, in addition to their salaries. See AMBASSADOR, ENVOY, CONSUL.

EMBATE'RION, a war-song of the Spartans, accompanied by flutes, which they sung marching in time, and rushing on the enemy. The origin of the E. is lost in antiquity.

EMBAT'TLED, or IMBATTLED, called also *crenellé,* one of the partition lines in heraldry, traced in the form of the battlements of a castle or tower. A bordure embattled is often given as a difference to any member of a family who is, or has been, a soldier.

EMBATTLEMENT. See BATTLEMENT.

EMBER or EMBERING DAYS. According to the *Book of Common Prayer* of the Church of England, three days are appointed four times in the year to be observed as days of fasting and abstinence; these days are the Wednesday, Friday, and Saturday after the first Sunday in Lent, after the feast of Pentecost, after the 14th Sept., and after the 13th Dec. The term "embering" has been variously derived from the Greek *ημεραι,* and from the embers or ashes which in the earliest times were strewed over the head at times of fasting, in token of humility and self-condemnation. But the more correct derivation would appear to be from the Saxon *Ymbrine dagas,* from the Saxon *ymb,* about, and *ryne,* a course or running, the term applied to these fasts because they came round at certain set seasons in the year.—Somner, *Dictionarium Saxonici.* This phrase is used in the laws of Alfred the great, and also of Canute, and corresponds with the term used by the canonists, *jejunia quatuor temporum,* the fasts of the four seasons. Mr. Somner says that the embering days were "times of old chosen and set apart for fasting and prayer for obteyning the fruits of the earth, and to give thanks for the same, whereas at those times they are either sowen, sprung up, coming in their ripenesse, or gathered into the barne, as also to obtaine the grace of the Holy Ghost, when holy orders are given and ministers made." It is to this latter purpose that the Church of England in the present day particularly devotes the ember days, and a special prayer is appointed for use at those seasons.

EMBERIZA and **EMBERIZIDÆ.** See BUNTING.

EMBEZ'ZLEMENT, the felonious appropriation by clerks, servants, or others in a position of trust, of goods, money, or other chattels intrusted to their care, or received in the course of their duty, on account of their employers. It is essential to the crime of E. that the article taken should not have been in the actual or constructive possession of the employer; for if it were, the offense would amount to larceny (q.v.). E. is not an offense at common law; hence, persons guilty of this crime were formerly suffered to escape punishment. In consequence of a flagrant instance of this immunity (Bazeley's Case, ii. Leach, 835), the act 39 Geo. III. c. 85, was passed, whereby E. was made a felony. This act has been repealed, but the law has since been fixed by subsequent enactments, and is now included in the act 24 and 25 Vict. c. 96.

Embezzlement by clerks or servants is punishable by penal servitude or imprisonment. See PUNISHMENT. If the offender be a male under 16, he may also be ordered to be privately whipped, at the discretion of the judge. Questions of much nicety often arose as to whether the facts proved constituted the crime of E. or that of larceny; but this distinction has ceased to be of any importance under the recent acts—the criminal justice act (14 and 15 Vict. c. 100), and the 24 and 25 Vict. c. 96, s. 72—whereby it is made competent, on an indictment for embezzlement, to convict a man of larceny, and *vice versâ.* And hence, whichever of the two offenses is charged against the servant, if the evidence shows he committed the other offense, then he may be found guilty of that other offense, and punished accordingly.

Embezzlement by bankers, brokers, factors, and other agents, is regulated by the above statute, sec. 3, formerly the fraudulent trustees act (20 and 21 Vict. c. 54). These most important statutes have rendered almost every conceivable species of fraudulent misappropriation by bankers and others a punishable offense. In particular, by the latter statute, E. by a bailee (see BAILMENT) is now indictable. Under this provision, a shopkeeper appropriating goods intrusted for repair, may be tried and convicted.

Embezzlement by bankrupts, or rather the pawning or disposing within 4 months before the bankruptcy of goods or any kind of property obtained on credit, is punishable by 2 years' imprisonment. See BANKRUPT.

Embezzlement of letters and newspapers by servants of the post-office, is also made highly penal by 7 Will. IV. and 1 Vict. c. 36. The E. of newspapers is punishable by fine or imprisonment; but to embezzle a letter, subjects the offender in all cases to penal servitude for 7 years; and if the letter contain money or valuables, to penal servitude for life.

Embezzlement of the queen's stores is punishable by penal servitude for 14 years. In regard to this species of E., summary authority was given to comptrollers and other officers named, on proof of E. of government stores below the value of 20s., to fine the offenders to the amount of double the value of the article taken.

In Scotland, the crime of E., or breach of trust, is punishable at common law. The distinction between this crime and that of theft is substantially the same as between E. and larceny in England. In both countries, the criterion relied upon to distinguish these crimes is the question of possession by the owner; but in Scotland the tendency of the decisions of late years has been to regard the appropriation of articles intrusted for a temporary purpose as amounting to theft. In this respect, the law of Scotland agrees

with that of England in regard to E. by a bailee. In Scotand, the appropriation of things found without an owner, would appear, according to Mr. Hume, not to be an indictable offense. Such a case would sometimes be treated in England as larceny (q.v.).

EMBEZZLEMENT (*ante*), in criminal law, consists in fraudulently removing and secreting personal property, with which the party has been intrusted, for the purpose of applying it to his own use. It differs from larceny, which is "the felonious taking and carrying away the personal property of another" by one who has not a legal possession thereof. The moral guilt of embezzlement is often greater than that of larceny, and the laws against it are, therefore, justly severe. This offense has, for some time past, been of very frequent occurrence in this country, many men of previously eminent standing for integrity having been detected in committing it. Trustees and other officers of charitable societies are guilty of embezzlement when they misappropriate the funds committed to their charge.

EMBLA, in Norse mythology, the first woman created. When the gods Odin, Hœnir, and Lodur left their home to wander on the earth, they found Ask and Embla (ash and elm) without power and without destiny; spirits they had not, nor sense, nor blood, nor power of motion, nor fair color. Odin gave them spirit, Hœnir sense, and Lodur blood and fair color. Some have it the gods were Odin, Veli, and Ve. The man they called Ask and the woman Embla. From this pair the human race descended; a dwelling was assigned to them in Midgard (the earth).

EMBLEM, a representation of an object intended to signify or indicate to the understanding something else than that which it directly represents to the eye. The meaning of the E. rests upon its secondary, not its primary signification. E. is often used in a sense synonymous with symbol, under which, as the wider word, it will bemore convenient to treat it.

EMBLEMATA (Gr.), the works of art with which gold and silver vessels were decorated by the ancients. These sculptured figures were generally executed either in the precious metals or in amber. They were called crustæ by the Romans, though the Greek word was also used.

EMBLEMENTS (Fr. *emblaver*, to sow with *blé* or wheat), growing crops of cereal and vegetable productions raised by the labor of the cultivator. Fruits of trees growing on the land, and grass, are not emblements. The law has ever been mindful of the interests of the tenant who has expended his toil and capital in tilling the ground. By the feudal law, when a tenant for life died between Mar. and Aug., his heirs were entitled to the profits for the whole year. By the existing law of England, a tenant for life, or other tenant, whose term may be suddenly and unexpectedly brought to a close, is entitled to reap the crop which he has sown, and to enter the lands after expiry of the term to remove the emblements. By 14 and 15 Vict. c. 25, a tenant at rack-rent (q.v.) under tenant for life is entitled, where the tenancy determines by death of tenant for life, to hold the land till the expiry of the current year. But if a term be brought to an end by the act of the tenant, he is not entitled to emblements. Thus, a tenant for life, who commits forfeiture, or a widow entitled to dower —who, as regards dower-lands, is considered tenant for life—marrying again, are not entitled to emblements. On the death of a tenant, the executor, and not the heir, is entitled to the emblements. By 11 Geo. II., c. 19, E. may be distrained for rent, and by common law they may be taken in execution. The right of life-renters in Scotland to reap the growing crop is somewhat similar to the English right to emblements. See LIFE-RENT.

EMBLICA, a genus of plants of the natural order *euphorbiaceæ*, having a fleshy fruit. *E. officinalis* is a tree found in most parts of India, with a crooked stem, thinly scattered spreading branches, long narrow leaves, minute greenish flowers, and a globular fruit about the size of a gall-nut. The fruit is very acid, and somewhat astringent, which qualities it retains when dry and shriveled. It is used in India as a deobstruent and febrifuge, also for tanning leather, and making ink, and is generally called *emblic myrobalans*.

EMBOLISM (derived from the Greek word *embolon*, a plug) is the term employed by recent pathologists to designate the plugging-up of a vessel by a clot of coagulated blood-fibrin, by a detached shred of a morbid growth from a diseased cardiac valve, etc. It is in cases of ill-nourished, broken-down constitutions, or after a protracted or a debilitating illness, that the morbid tendency of the fibrin to coagulate spontaneously within the veins chiefly exists, and in such cases very trivial circumstances may call it forth, especially if they lead to any pressure on the vessel. Clots, or portions of a clot, may be transported by the blood-current from the venous system to the right side of the heart, and block up the pulmonary artery either entirely or in part: if the occlusion is entire, sudden death is produced; while, if it is only partial, gangrene, or inflammation of a part of the lung, commonly ensues. Many of the sudden deaths of women in childbed (till recently quite inexplicable) are due to this cause, the plug being formed in the inflamed uterine veins, or possibly, in some cases, in the right side of the heart, and passing from thence to the spot where its arrest proves suddenly fatal. Several cases

of this kind are reported in Simpson's *Obstetric Memoirs*. Similar accidents may happen in the arterial system. A detached fragment of a diseased tricuspid or aortic valve of the heart, or a separated fragment of coagulated fibrin, may be driven onwards in the blood-current, and enter and occlude some of the cerebral arteries, causing softness of the brain, by cutting off the due supply of nourishment. For further details, the reader is referred to an exhaustive treatise on this subject published a few years ago by Cohn, entitled *Ueber embolischen Krankheiten*.

EMBOSSING, the art of producing raised figures upon various substances, such as paper, leather, wood, metals, etc. This is usually effected by pressing the substance into a die, the kind of die and mode of applying the pressure being modified according to the nature of the design and the properties of the substance to be embossed. Sheet-metal is embossed by stamping it between a pair of steel dies, one in relief, the other in intaglio. See DIE-SINKING. When the pattern is a deep one, several pair of dies are used, and several blows given with each, the metal being occasionally annealed. The first stamping produces a crude resemblance to the final design, of moderate depth; successive stampings bringing up more of the details, and giving increased depth. The upper die is usually raised by a rope attached over a pulley to a stirrup, in which the workman places his foot; he draws his foot down to raise the heavy die to the required height, and then suddenly releases the pressure of his foot from the stirrup, when the die descends by its own weight. While thus raising the die with his foot, he adjusts the work in its place with his hands. Smaller work is embossed with a screw-press, the lever of which is turned with one hand, while the work is placed under the dies and removed by the other. Paper and card are embossed in a similar manner, but the dies are frequently of brass, sometimes of copper electro-deposits, suitably backed. The counter-die is commonly made of soft metal, card or mill board, pressed into the metal intaglio die until a sharp impression is produced. The paper or card is well damped, and a fly-press is generally used. The leather or cloth for bookbinding is embossed in this manner, the counter-die being usually made by gluing several pieces of mill board together, and gluing them to the upper bed of the press, then stamping these into the lower die until a perfect impression is obtained. The embossing press designed and constructed by Mr. Edwin Hill, for impressing the medallion upon postage envelopes, is a very elaborate and beautiful machine, which inks the die itself, and with the aid of two boys, to place and remove the envelopes, embosses sixty envelopes in a minute. When large surfaces of textile fabrics, such as table-covers, etc., have to be embossed, the fabric is compressed between rollers, one being of metal, upon which the device is sunk like a die; the counter-roller or bed-cylinder is of paper covered with felt; this yields sufficiently to allow the fabric to be pressed into the die-cylinder. A third smooth metal roller is commonly used to press out again the impression made upon the bed-cylinder; this acts upon the bed-cylinder on the side from which the fabric emerges. Paper is sometimes embossed in this manner; and the flatting roller may be dispensed with if the cylinders are sufficiently accurate in their diameters for the pattern always to fall on the same place at each successive revolution. Leather embossed in high relief has been used for ornamental purposes in place of wood-carving, on picture-frames, cabinet-work, etc. The dies are of type-metal or electro-deposits, and the leather is softened or fulled, i.e., worked with water till it contracts and thickens, then it is pressed into the dies by suitable round pointed tools, like modeling tools, made of wood, bone, or copper. When dry, the leather is removed from the molds, and by its elasticity and shrinking it will relieve from very deep and undercut designs.—Mr. Straker's mode of embossing wood differs from all the above, and is very curious and ingenious. When wood is pressed and rubbed with a blunt instrument, the surface yields, and a depression of some depth may be made in it; if the wood be now soaked in water, the depressed portion will rise again to its original level. Mr. Straker takes advantage of this property thus. He rubs down the surface in those parts that are to be finally in relief, he then planes or shaves away the uncompressed portions until the bottom of the depressions are reached and made level with the new surface; the wood is then soaked; the compressed parts rise to their original level, and, of course, in doing so, rise above the portions that have been planed away, and present the required device in relief.

EMBOUCHURE (Fr.), that part of a wind instrument to which the lips are applied to produce the sound.—The term EMBOUCHURE is also applied to the mouth of a river.

EMBOWED, the heraldic term for anything which is bent like a bow. A sinister arm couped at the shoulder, is embowed. When the arm is turned the reverse way, it is said to be counter-embowed.

EMBRACERY, in the law of England, the offense of influencing jurors by corrupt means to deliver a partial verdict. This offense is a species of maintenance (q.v.). The giving of money to be distributed amongst jurors is embracery, though the money be not actually distributed. Not only persons attempting to influence the jury, but jurors themselves attempting unduly to bias the minds of their fellows, are guilty of embracery. The using indirect means in order to be sworn on a jury, is also embracery. This offense is punishable by various old statutes. At present the crime is punishable by 6

Geo. IV., c. 50, which enacts, that every person guilty of embracery, and the jury consenting thereto, shall be punished by fine and imprisonment.

EMBRA'SURES, in fortification, are openings in the parapets, flanks of bastions, and other parts of the defense-works, through which cannon are pointed. The siege-batteries of the enemy have also embrasures. Their use is, to shield as much as possible the guns, gun-carriages, gunners, and interior of the place, and yet leave spaces for the free firing of the guns. Each opening slopes outwards, so as to give a greater sweep to the gun's action.

EMBROCA'TION (Gr. *em*, into, and *brechō*, I wet), the same as liniment (q.v.).

EMBROI'DERY, the art of producing ornamental needlework-patterns upon fabrics of any kind. This art is coeval with the earliest and rudest manufacture of hair and woolen fabrics. It was one of the most important of the early arts in oriental countries, where it is still practiced with great skill and diligence. It is common among most savage tribes that wear any kind of clothing. The blanket-wrapper of the red Indian is commonly ornamented with E.; the Laplander embroiders upon the reindeer skin that forms his clothes patterns worked with needles of reindeer bone, and thread of reindeer sinews and strips of hide. It is practiced as a domestic art in our own country by all classes, from the princess down to the pauper school-girl, and is carried on in large manufactories by very elaborate machinery.

The Chinese are perhaps the most laborious and elaborate hand-embroiderers of modern times; their best work is upon silk. The figures are either in colored silk alone, or in silk combined with gold and silver thread; the figures of men, horses, dragons, etc., being outlined with gold cord, and filled up colored and shaded with silk. The Persians, Turks, and Hindus also still excel in E.; they use, besides silk and gold and silver thread, beads, spangles, pearls, and precious stones. The dress-slippers of Turkish women of all ranks are elaborately embroidered, usually with a precious stone or a glass bead in the middle of the toe-part of the slipper, and a radiating pattern in gold, silver, or brass wire and silk surrounding it. The Turkey carpet is a sort of embroidered fabric. See CARPETS.

Some of the oriental and Indian embroideries include in their work a great variety of materials besides those above mentioned; feathers are largely and very tastefully used; the skins of insects; the nails, claws, and teeth of various animals; nuts, pieces of fur, skins of serpents, etc., are among these. Coins, which are so commonly used as ornaments for the hair of unmarried women in the east, are sometimes also worked into their dresses with the embroidery. This is especially the case with the Turks and Georgians. The Indian women embroider with their own hair and that of animals.

Tapestry is a kind of E., formerly done with the needle, but now chiefly with the shuttle. This kind of work is, in fact, intermediate between E. and weaving, and it is somewhat difficult to determine under which it should be classed, but in accordance with the definition given above, we shall only include needlework under E., and tapestry will be separately treated.

For hand-embroidery, the fabric is usually stretched upon a frame, and the design to be worked is drawn upon it, or some other contrivance is used to guide the worker. If the fabric is sufficiently thin and open, a colored drawing or engraving may be placed behind the work, and followed with the needle. A sheet of thin transparent paper, with lines upon it corresponding to the threads of the canvas to be worked upon, is sometimes used; this is secured by gum or wax to the drawing; and the design is copied by observing the number of small squares occupied by each color, and filling in the corresponding meshes of the canvas. *Berlin-work*, which is a kind of E., is done in a similar manner, the pattern being an engraving on which the lines corresponding to the thread are printed, and the meshes filled up with the required colors, painted in by hand, by women and children, who copy it from the original design of the artist. The name has been given from the fact, that the best patterns have, since 1810, been published by Wittich, a printseller of Berlin.

In France, pricked patterns are sometimes used, one for each color, and colored powders are dusted through the holes upon the fabric to be worked.

All these devices render the art of E. a mere mechanical operation, requiring no further artistic skill or taste than is exercised in knitting stockings; but when the embroidress draws the design in outline upon the fabric, and works in the colors with her needle under the guidance of her own taste, E. becomes an art that might rank with water-color drawing or oil-painting; and it is to be regretted that so much time should be devoted by ladies to the mechanical, and so little effort made in the direction of truly artistic embroidery.

Muslin-embroidery has been very fashionable of late. This is purely mechanical work. The muslin is printed with a pattern made up of holes of different dimensions; these are cut or punched out, and their edges sown with a "button-hole stitch." This kind of work is much used as trimming for ladies' clothing, for collars, and children's clothes.

Machine-embroidery has been practiced with considerable success during the last quarter century. A machine was exhibited in the French industrial exhibition of 1854, by M. Heilmann of Mulhausen, by which one person could guide from 80 to 140 needles,

all working at the same time, and producing so many repetitions of the same design. Although the details of the construction of this machine are rather complex, the principle of its action may be easily understood. The needles have their eyes in the middle, and are pointed at each end, so that they may pass through from one side of the work to the other without being turned. Each needle is worked by two pair of artificial fingers or pincers, one on each side of the work; they grasp and push the needle through from one side to the other. A carriage or frame connected with each series of fingers does the work of the arm, by carrying the fingers to a distance corresponding to the whole length of the thread, as soon as the needle has passed completely through the work. The frame then returns to exactly its original place, and the needles are again passed through to the opposite set of fingers, which act in like manner. If the work were to remain stationary, the needles would thus pass merely backwards and forwards through the same hole, and make no stitch; but by moving the work as this action proceeds, stitches will be made, their length and direction varying with the velocity and the direction in which the work moves. If 140 needles were working, and the fabric were moved in a straight line, 140 rows of stitching would be made. If the work made a circular movement, 140 circles would be embroidered, and so on. In order, then, to produce repetitions of any given design, it is only necessary to move the fabric in directions corresponding to the lines of the design. This is done by connecting the frame on which the work is fixed to an apparatus similar to a common pantagraph, or instrument so constructed that one end repeats on a smaller scale exactly the movements which are given to the other. See PANTAGRAPH. The free end of this is moved over an enlarged copy of the design, the movement being a succession of steps, made after each set of needles has passed through; and thus the work is moved into the position required to receive the next stitch of the pattern.

This machine was subsequently patented in England, and many improvements have been made upon its details, but the principle of its construction remains the same.

Although it is *possible* to embroider any design with such machines, there are only certain designs that can be worked economically; for to do this, the patterns must be so designed as to consume each needleful of silk without waste. The length of silk required for each color can be calculated with extreme accuracy, and the designer is usually limited by this requirement. A greater range is, however, obtainable by dyeing the same thread of silk in different colors, the length of each color corresponding to what is required for producing the pattern; but a large demand for each pattern is required to render this profitable.

EMBRUN, a t. of France, in the department of Hautes Alpes, is situated on a platform of rock in the midst of a plain, on the right bank of the Durance, 20 m. e. of Gap. Seen from a distance, the town has an imposing appearance. The streets of E. are narrow, dirty, and irregular. It is surrounded by loop-holed ramparts and ditches, and strengthened by bastions. The principal buildings are the cathedral, a Gothic edifice, surmounted by a lofty Romanesque tower, and the barrack, formerly the archbishop's palace. E. manufactures broadcloth, counterpanes, hats, cotton-yarn, and leather. Pop. '76, 3,287.

E. occupies the site of the ancient Ebrodunum, capital of the Caturiges, and an important Roman station. The line of its archbishops can, it is said, be traced to the time of Constantine. In modern times E. has been thrice destroyed by fire: by the Moors in 966, during the religious wars in 1573, and by the duke of Savoy in 1692.

EMBRYO (Gr.), an organized being in a rudimentary condition, or the rudiment from which, under favorable circumstances, an organized body is to be developed. In botany, the term E. is applied to the germ formed within the ovule on fertilization, and which increases to become the principal part of the seed. The albumen or perisperm of the seed, being regarded as a mere store of nourishment for the E., is not accounted part of the E.; the cotyledons, however—although a large store of nourishment is often laid up in them—are considered as essentially belonging to it, along with the *plumule*, the *radicle*, and the connecting parts. As to animals, the term E. is used as equivalent with *fœtus*, and as designating the rudimentary animal from the moment of impregnation until the egg is hatched; but although this takes place at very different stages of development in different kinds of animals, and consequent metamorphoses are undergone by some before they reach their perfect state, the term E. is not applied to the *larvæ* and *pupæ* of insects, or to the analogous states of other classes of animals. Eggs contain, along with the E., a store of nourishment for it in the earlier stages of its development. See REPRODUCTION, DEVELOPMENT OF THE EMBRYO, EGG, FŒTUS, OVULE, SEED, and SPORE.

EMBRYOL'OGY. See DEVELOPMENT OF THE EMBRYO.

EMBRYOT'OMY, a division of the fœtus into fragments, to extract it by piecemeal, when the narrowness of the pelvis or other faulty conformation opposes delivery.

EMBURY, EMMA CATHERINE, 1806-63; b. New York; daughter of Dr. James R. Manley. She has published many poems and prose sketches and tales, among them *Guido and Other Poems; Constance Latimer, or the Blind Girl, and other Tales; Pictures of Early Life; Glimpses of Home Life; Nature's Gems, or American Wild Flowers; Love's Token Flowers; The Waldorf Family*, etc.

EMBURY, PHILIP, b. Ireland, 1728; d. Troy, N. Y., 1775; widely known as the "founder of American Methodism." He was of German descent, and came to America in 1760. In 1766, he organized a society in New York, and the next year began to preach in a rigging loft, which place became famous as the cradle of Methodism in this country. The next year a church was built, on the site of the present old John street church, partly by E.'s own hands. About a year later a company of missionaries sent out by Wesley arrived in New York, and Embury went as a missionary to the region around Albany and Troy. He died suddenly from an accident.

EMDEN, a t. in the province of Hanover, once in the principality of East Friesland, is situated a little below the embouchure of the Ems into Dollart bay, in lat. 53° 22' n., long. 7° 13' east. It lies low, but is protected by strong dykes from any inroad of the waters of the bay. Nevertheless, occasional inundations take place; as in 1826, when the water stood up to the first floor of the houses for three months. E., which is the chief commercial town of Hanover, is surrounded by walls and towers, is well built, has spacious and well paved streets, and houses remarkable for their appearance of comfort, and for their extreme cleanliness. It is intersected by numerous canals, which are crossed by about thirty bridges. The Delf canal runs s. from the town to Dollart bay, a distance of about 2 m., but it can be entered at high water only, and even then is not navigable for vessels of more than 13 or 14 ft. draught; all vessels of greater draught being obliged to unload in the roadstead of Delf, at the mouth of the canal. The principal building, and one of the finest public edifices in the whole region, is the town-hall, containing a library and a curious collection of ancient arms and armor. E. stands in a district of great fertility. It has a good deal of ship-building, besides various other manufactures. From this town, from 50 to 60 vessels are sent out to the herring-fishing off Scotland. E. was made a free port in 1751, came into the possession of Holland in 1808, and with the whole of East Friesland, was incorporated with the kingdom of Hanover in 1815. Pop. '75, 12,866.

EMERALD (Sp. *esmeralda*, Fr. *émeraude*, Ger. *smaragd*, Gr. *smaragdos;* the name is originally Semitic, or at least eastern, but the signification unknown), a mineral generally regarded by mineralogists as merely another variety of the same species with the beryl (q.v.), with which it essentially agrees in composition, crystallization, etc., differing in almost nothing but color. The E., which, as a gem, is very highly valued, owes its value chiefly to its extremely beautiful velvety green color. It is composed of about 67 to 68 per cent of silica, 15 to 18 of alumina, 12 to 14 of glucina, and a very little peroxide of iron, lime, and oxide of chromium. Its color is ascribed chiefly to the oxide of chromium which it contains. Its specific gravity is 2.577 to 2.725. In hardness it is rather inferior to topaz. The localities in which E. is found are very few. The finest have long been brought from South America, where they are obtained from veins traversing clay-slate, hornblende slate, and granite, in a valley not far from Santa Fé de Bogota. Emeralds of inferior quality are found in Europe, imbedded in mica slate in the Henbach Valley in Salzburg. They are also found in the Ural; and some old mines in Upper Egypt have also been discovered to yield them, from which, probably, the ancients obtained them. This gem, known from very early times, was highly prized by the ancients. Pliny states that when Lucullus landed at Alexandria, Ptolemy offered him an E. set in gold, with his portrait engraven on it. Many wrought emeralds have been found in the ruins of Thebes. Nero, who was near-sighted, looked at the combats of gladiators through an eye-glasa of E., and concave eye-glasses of E. seem to have been particularly esteemed among the ancients. As a precious stone, the E. is rarely without flaw. Its value also depends much on its color. A very perfect E. of six carats has been sold for £1000.

It appears not improbable that emeralds have been found in the east, in localities not at present known, but the name E. or ORIENTAL E. is often given to a very rare, beautiful, and precious green variety of sapphire (q.v.).

E. COPPER is a beautiful and very rare E. green crystallized mineral, also called DIOPTASE, found only in the Kirghis Steppe, and composed of about 39 parts silica, 50 protoxide of copper, and 11 water.

EMERALD BIRD OF PARADISE, a native of New Guinea, and one of the most beautiful of its order. The skins and feathers are highly prized for ornament, and bring large prices.

EMERSION, the reappearance of one heavenly body from behind another, after an eclipse or occultation. The immersions and emersions of Jupiter's first satellite are particularly useful for finding the longitude of places. Minutes or scruples of emersion are the arc of the moon's orbit passed over by her center, from the time she begins to emerge from the earth's shadow to the end of the eclipse.

EMERSON, GEORGE BARRELL, LL.D., b. Maine, 1797; graduate of Harvard, where he was afterwards tutor in mathematics and natural philosophy. He was a popular teacher in Boston until his retirement from professional life in 1855. He has published a second part to *School and School Master;* a *Manual of Architecture; Report on the Trees and Shrubs growing naturally in the Forests of Massachusetts*, etc. He has been president of the Boston society of natural history, and was chairman of the commission for the zoological and botanical survey of the state.

EM'ERSON, RALPH WALDO, the most celebrated of American philosophers, was b. at Boston, United States, May 25, 1803, entered Harvard university in 1817, graduated in 1821, and became pastor of a Unitarian congregation in Boston in 1829. This office, however, he resigned in 1832, on account of the gradually increasing differences between his own modes of thought and those of his hearers. The next year he spent in England. Since then, he has led a quiet; retired, meditative life, chiefly at Concord. Among the earliest noticeable productions of his pen were two lectures, or orations, entitled *Nature and Man Thinking*, delivered before the Phi Beta Kappa society at Cambridge, United States, in 1837. In the following year appeared his *Literary Ethics, an Oration;* and in 1841, *The Method of Nature, Man the Reformer*, the first series of his *Essays*, and several lectures, etc. Three years later, he issued a second series of *Essays*. In 1846, he published a volume of poems. In 1849, he revisited England, to deliver a series of lectures on *Representative Men*. When published, they were generally reckoned the most vigorous and intelligible of all the author had then written. In 1852, in conjunction with W. H. Channing and J. F. Clarke, he published the Memoirs of Margaret Fuller (q.v.), Marchesa d'Ossoli. *English Traits* appeared in 1856, and the *Conduct of Life* in 1860. In 1865, E. published an *Oration on the Death of President Lincoln;* a second volume of poems in 1868; *Society and Solitude*, a third volume of essays in 1870; in 1871 an introduction to Goodwin's translation of Plutarch's *Morals; Parnassus; Selected Poems;* a fourth volume of essays; *Letters and Social Aims* (1875). He received the degree of LL.D. from Harvard university, U. S., in 1866. There is perhaps no living writer of note regarding whom opinions are so divided as Emerson. Some critics have placed him amongst the profoundest thinkers; others have pronounced him a sciolist and charlatan. No man who is himself sincere will doubt the sincerity of the American philosopher. It is true, however, that the subtlety of his intellect often deceives him by the facility with which it discovers divine meanings in nature and the human soul. E. never pauses to harmonize his thoughts and convictions. He knows that an idea is more forcible and attractive, and can be clothed in more brilliant and picturesque phraseology when it is not qualified, and, as it were, dragged down from its elevation by the influence of other ideas. He loves to watch the play of thought, and to dream and muse about it, borne up on the wing of a pure and delicate imagination, rather than to weigh its significance, or to build it up into an "intellectual system" or a creed. E. thus belongs to the class of minds which are intuitional rather than reflective, and subtle rather than sagacious. His thinking charms, animates, and vividly excites the mental faculty of his reader, but it does not satisfy or settle any question conclusively. Hence his speculations on religion, philosophy, literature, and life, though stimulating to the young, are coldly regarded by men of mature and sage understanding. E. has nowhere formally defined the fundamental basis of his speculation. He appears to be what is called a pantheist, at least he rejects entirely that kind of theism which separates God from nature, and which looks upon him as simply a living spiritual personality. He will not recognize a God who is not "one with the blowing clover and the falling rain." In regard to man and his destinies, he entertains exalted hopes; but religion is not in his eyes a divinely revealed (in the ordinary sense) or infallible thing; all creeds are merely "the necessary and structural action of the human mind" in the course of its historical progress. Man made them all (Christianity included), and he believes, that from the inexhaustible depths of our nature there will come forth in due time new and ever higher faiths, which will supersede those that have gone before. E. is often said to have derived a good deal of his thinking from Thomas Carlyle. This is true, but not in any sense that can justify the vulgar criticism which makes him out to be a "Yankee pocket-edition of Carlyle." He is essentially an original and independent genius. Some of his writings have been translated into French, and have excited considerable admiration among the Parisian transcendentalists. See Montégut's *Essais de Philosophie Américaine* (1851).

EMERSON, RALPH WALDO, LL.D. (*ante*); an eminent American poet and essayist, b. Boston, May 25, 1803. He is of a clerical lineage, being the eighth in succession of a consecutive line of Puritan ministers. His father, who died when he was but seven years of age, was the Rev. William Emerson of the First church in Boston. He was fitted for college in the Boston public Latin school, entered Harvard in 1817, and graduated in 1821. His tastes were literary rather than scholastic. In the Latin school he wrote verses for exhibition days, and in college the library had for him more charms than the text-books. His rank as a student was not above that of some others in his class, though he took two prizes for dissertations and one for declamation, and was the class-day poet at the time of his graduation. For five years after leaving college he was engaged with his brother William in teaching a successful school for girls in Boston. During this time he must have given attention to theological studies, for he was "approbated to preach" in 1826. After this, for the benefit of his health, he passed a winter in South Carolina and Florida. In Mar., 1829 he was ordained as colleague of the Rev. Henry Ware in the Second Unitarian church in Boston. His pastorate was short, for he soon found himself entertaining scruples concerning the ordinances of the church, and especially unwilling to administer that of the Lord's Supper. His resignation of his pulpit and of the ministry for such a reason made no little stir in the Unitarian denomi-

nation, and in the other Christian sects, being regarded as a very strange event. The parting between him and his congregation, in 1832, was most honorable and affectionate on both sides, for, as a preacher, he had won popularity and favor. He now went to Europe for a year, and on his return, in the winter of 1833–34, he began in Boston his eminent career as a lecturer, with a discourse upon "Water," before the Boston manufacturers' institute. Three other lectures, two upon "Italy," and one on "The Relation of Man to the Globe," were delivered during the same season. Shortly after this he delivered in Boston a course of biographical lectures on Michael Angelo, Milton, Luther, George Fox, and Edmund Burke; the first two of which appeared afterwards in the *North American Review*. Since that day, until within a few years past, he has been among the most conspicuous and popular of American lecturers, traveling extensively in the eastern, northern, and western states, and attracting large audiences, less by any oratorical gifts than by the solid value of his thoughts. In some places he has been a great favorite, speaking by invitation for the fortieth or fiftieth time in the same lyceum course, with undiminished interest. In 1835, Emerson took up his residence in Concord, Mass., where he still remains, the foremost citizen in the place, sharing the love, honor, and reverence of all the people, without distinction of party or sect. In 1835, and the three or four following years, he delivered in Boston successive courses of lectures on English literature, the philosophy of history, human culture, human life, and the times. In 1834, he delivered a poem before the Phi Beta Kappa society of Harvard; in 1837, an oration before the same society upon "The American Scholar;" and in 1838, an address to the senior class of the Cambridge divinity school, which created no little stir in the literary and theological world. His first book, a thin volume entitled *Nature*, appeared in 1836, and was received by a few enthusiastic admirers as opening a new era in American thought, while in some quarters it was sharply criticised. In 1841, appeared *The Method of Nature*, which developed more fully the peculiar qualities of his mind and his ways of thinking, and by its freshness and beauty won him many admirers. For reasons which to many leaders of popular thought were incomprehensible, he was rapidly gaining a strong hold upon the affection and reverence of an increasing multitude of his countrymen, and winning the attention of thoughtful men on the other side of the Atlantic. The "transcendental" movement, so called, was coincident with the appearance of his earliest works, and received from them both impulse and direction. In 1840, appeared a quarterly magazine entitled *The Dial*, with Miss Margaret Fuller as editor, assisted by A. Bronson Alcott, William H. Channing, Emerson, Theodore Parker, George Ripley, and others. This periodical was continued four years, during the last two of which Emerson was the editor. Two volumes of *Essays* were Emerson's next issues, the first appearing in 1841, the second in 1844. His collected *Poems* were published in 1846. In 1847, he visited England to fulfill engagements as a lecturer, and was warmly received by the lovers of his books, and by the public generally. In 1849, he collected into a volume of *Miscellanies* his "Nature," and nine lectures and college addresses, which had previously appeared in *The Dial*, or in pamphlet form. In 1850, appeared his *Essays on Representative Men*, a work of great interest and power. In 1852, he assisted in preparing the memoirs of Margaret Fuller Ossoli. In 1856, he published *English Traits*, a work which well illustrated his powers of accurate observation, and his clear understanding of the workings of human nature under various conditions. Next appeared, in 1860, *The Conduct of Life*, a work which brings clearly to view the exalted moral and ethical principles which underlie and pervade all that he has written. A subsequent volume embraced a portion of his contributions to the *Atlantic Monthly*. In 1867, appeared a volume of his poems, *May Day and Other Pieces*. In 1870, he published *Society and Solitude*, and in 1869, appeared his *Prose Works Complete*. In 1875, he published four series of *Essays*. In 1878, in the *North American Review*, appeared a paper, *Sovereignty of Ethics*, which fixed the public attention as the ripest fruit of his broad culture; and in 1880, the *Unitarian Review* published, under the title of "The Preacher," his address of 1879 in the divinity chapel at Cambridge. He is now, in a serene old age, reported as being engaged in revising for the press his remaining MSS., which will not probably see the light until after his death. In the midst of his literary labors Emerson has found time to manifest his interest in great public questions as they arose. Some of his letters upon passing events in the newspaper press have exerted a wide influence. While he was a pastor in Boston he opened his pulpit to an earnest protest against American slavery, and during the whole period of the antislavery agitation he constantly manifested his sympathy with those who sought to deliver the land from the curse of human bondage. In 1844, he gave emphatic expression to his views in an address delivered upon the 1st of Aug., the anniversary of emancipation in the British West Indies. Though not in the technical sense of the word a reformer, his habits and tastes being rather those of a scholar and man of letters, every earnest movement for the welfare of humanity has had his sympathy. He gave his name to the call issued in 1850 for the first convention ever held in Massachusetts to secure for women equal rights with men as citizens and voters. He is a member of the American academy of arts and sciences, of the American philosophical society, of the Massachusetts historical society, and a vice-president of the free religious association. He is also a member of the board of overseers of Harvard university, from which he received the degree of doctor of laws in 1866. His writings, though marked by an eth-

ical and spiritual vitality of the highest order, are utterly devoid of system, and pervaded by a certain mystical quality, charming to some but bewildering to others. His intellectual gems are profusely sown throughout his pages according to no visible or conscious method, and with settings that seem quite accidental; but they glow with a genuine luster wherever found. To the arts and processes of the logician he pays no regard, evidently thinking that they tend to belittle, rather than exalt, the truth. He simply affirms what he believes, making his appeal at every step to the moral intuitions of the reader, in the faith that the "spirit of man is the candle of the Lord," with a power of illumination adapted to every emergency. His position is clearly indicated in a simple sentence from his address at the divinity school in 1838: "The assumption that the age of inspiration is past, that the Bible is closed, the fear of degrading the character of Jesus by representing him as a man, indicate with sufficient clearness the falsehood of our theology." His earlier writings are supposed by some to show a drift towards pantheism, but others repel this interpretation as unjust. Certainly he has never called himself a pantheist, and there is unquestionable evidence that whatever may have been his former speculations, that name cannot truly be applied to him now. His friend A. Bronson Alcott reports him as saying: "I do not care to classify myself with any painstaking accuracy with this sect or with that; but if I am to have any appellation at all of a religious kind, I prefer to be called a Christian theist. You must not leave out the word Christian, for to leave out that is to leave out everything." Confirmation of this is to be found in his latest publication, *The Preacher*, in which he says: "Unlovely, nay, frightful, is the solitude of the soul which is without God in the world. To see men pursuing in faith their varied action, warm-hearted, providing for their children, loving their friends, performing their promises—what are they to this chill, houseless, fatherless, aimless Cain, the man who hears only the sound of his own footsteps in God's resplendent creation?"

EMERY (Fr. *émeril*, Ger. *schmergel*, Gr. *smiris;* allied to *smear*), a variety of corundum (q.v.), or of the same mineral species of which corundum and sapphire (with oriental ruby, etc.) are also varieties. It agrees with them very perfectly in composition, hardness, and specific gravity; but is dull, opaque, and not crystallized, sometimes of a grayish black, and sometimes of a blue color. It occurs both massive and disseminated. Its masses, although very compact, have a somewhat granular structure. It is found in several parts of Europe, in Asia Minor, Greenland, etc., generally in masses scattered through aqueous deposits, but in one locality in Saxony in beds of steatite in a schistose rock. The E. of commerce is chiefly obtained from the island of Naxos. Being very hard, it is much used for grinding glass and polishing metals and other hard substances. It is found in lumps, having a granular structure. It is composed of alumina, oxide of iron, and silica, with a little lime, in proportions varying considerably with different specimens. The following may be taken as an average: alumina, 82; oxide of iron, 10; silica, 6; lime, 1½.

It is prepared for use by first breaking it into lumps about the size of a hen's egg, then crushing these to powder by stampers. It is then sifted to various degrees of fineness, which are numbered according to the meshes of the sieve. Plate-glass manufacturers and others separate E. powder into different degrees of fineness by the method of *elutriation* (q.v.). A number of copper cylinders of graduated capacities are placed in a row, and filled with water; the E., churned up with an abundance of water, is admitted by a pipe into the smallest, it then passes to the next in size, and finally flows from the largest; and thus, as a given quantity of water with E. suspended in it, passes in equal times through vessels of varying capacities, the amount of agitation will obviously be greatest in the smallest vessel, least in the largest, and in like proportion with the intermediate; the largest particles, therefore, sink in the smaller vessel, and so on till only the very finest will reach the largest vessel. In this manner, any number of gradations of fineness may be obtained, according to the number and sizes of the vessels. Elutriation in oil or gum-water is sometimes used on a smaller scale, the E. being stirred up in the liquid, and portions poured off at different intervals of time, the finest being, of course, the last to settle. The use of the oil or gum is to make the subsidence take place more slowly.

E. thus prepared is used for a great many important purposes in the arts. Being next in hardness to diamond-dust and crystalline corundum, the lapidary uses it for cutting and polishing many kinds of stone. Glass-stoppers of all kinds are ground into their fittings with it. Plate-glass is ground flat by its means; it is also used in glass-cutting, and in grinding some kinds of metallic fittings. When employed for the polishing of metals, it has to be spread on some kind of surface to form a sort of fine file. *E. paper*, *E. cloth*, *E. sticks*, *E. cake*, and *E. stone*, are various contrivances for such purposes.

E. paper is made by sifting E. over paper which has been covered with a coating of glue. It is used either by wrapping it round a fine file, or a stick, or in the hand, according to the form of the work. See POLISHING OF METALS.

E. cloth is made like E. paper, with coarse calico substituted for the paper. The E. does not adhere so well as to paper, and it is therefore not used by metal-workers, who work E. paper till smooth with wear, but is chiefly used for purposes where the hand alone is used, and paper would tear.

E. sticks are used for the same purposes as E. paper wrapped round files; they are made of deal sticks shaped like files, then glued over, and dipped once or twice in a heap of emery.

E. cake is a compound of bees-wax, suet, and E., melted and well worked together. It is applied to buffing wheels, etc.

E. stone is a kind of earthenware mixed with E., formed by pressing a mixture of clay and E. into suitable molds, and then firing, like common earthenware. It is molded into wheels, laps, etc. Its hardness and cutting power are very considerable.

EMESA. See HEMS, or HOMS.

EMET'ICS, medicines given for the purpose of producing vomiting (q.v.). They are given when it is desirable to relieve the stomach of some noxious or indigestible substance, as a narcotic poison, or excess of food, or some special article of diet which has disagreed. E. are also administered in cases of fever, where the copious secretion they produce from the glands of the stomach and intestines is supposed to have a directly curative effect, aided, perhaps, by the sedative action of E. upon the circulation and nervous system. There is a considerable amount of evidence to show, that E. have the power of cutting short typhus and other fevers in the earliest stage, and afterwards of making the attack of the disease less severe. In diseases of the respiratory organs, E. are given as the quickest and safest method of removing accumulated mucus from the air-passages; and in croup (q.v.), their action is especially favorable, being often followed by expectoration and a rapid improvement in the suffocative symptoms. E. are to be given with great caution, however, in all very depressed states of the system, as their primary action is to produce nausea (q.v.), which is attended always with more or less diminution of the vital power, and often with great depression of the heart's action, amounting to syncope or fainting. The principal E. are the preparations of antimony, zinc, and copper; ipecacuanha in powder or in wine; squill, lobelia, and, generally speaking, the whole class of expectorants and irritants; the latter of which, however, with the exception of sulphate of zinc, and perhaps mustard and water, form a dangerous kind of E., which should never be administered when the milder kinds can be procured.

E'METINE is the alkaloid which forms the active principle of ipecacuanha root. It is a yellowish-white powder, which is slightly soluble in cold water, but dissolves readily in alcohol. When taken internally, it exhibits violent emetic properties, $\frac{1}{20}$th of a grain being sufficient to cause vomiting. See IPECACUANHA.

EMIGRA'TION is the passing from one part of the world to another for the purpose of permanently settling in it. People going thus from one district of the same state to another—especially if it be a distant part, with different habits and physical peculiarities—are sometimes said to emigrate, and in this way the term has been often applied to the English and Scotch settlers in Ireland. In its established signification, however, the word now refers to those who leave the state or dominions in which they have heretofore lived, and in this sense the term applies to those going to the colonies, though these are, like the United Kingdom, under the authority of the British crown. In the country which people leave, they are called emigrants or wanderers out—in that in which they settle, they are usually called immigrants. Jacob and his family were immigrants to Egypt, and their descendants became emigrants from that country when they went to inherit the promised land.

The Greeks were addicted to E., owing, it has been said, to the many political contests which drove the weaker party from home. Greek emigrants planted colonies on the borders of the Mediterranean and the Black sea, carrying them as far northward as France, where they established the city of Marseilles. The Romans were great colonizers, but by conquest rather than emigration. They disliked leaving Italy; and the military and civil officers necessary to rule a colony were generally the only Romans who abode in it. These even did not, in general, settle in the colonies with their families, but were recalled after a certain period of service, the whole arrangement much resembling that for the government of British India.

The migrations of the northern tribes who overran the Roman empire, are well known in history; their wanderings may be said, indeed, to have continued down to the 13th century. Those who wandered from the north into France, where they acquired great territories, became known as Normans, and were remarkable for entirely throwing off the language and manners, and even all the traditions of their original homes, and becoming the most civilized and courtly portion of the French people. But though thus changed, they still continued to wander, spreading over Britain, Sicily, and the intervening portions of Europe.

The discovery of America opened a vast new field for E., which was taken immediate advantage of by the Spanish and Portuguese, and later, by the British, the French, the Germans, and the Dutch. In the 17th c., many of the English Puritans, persecuted in, or discontented with, their own country, found it more congenial to their tastes to live together in a new country, where they would be free from the presence of those who did not sympathize with them, and they thus founded the New England colonies. It is singular that, in the 19th c., an attempt should be made to revive the plan of emi-

grating for the purpose of maintaining an exclusive church, as, for instance, in the English high church colony of Canterbury, and the Scotch free church colony of Otago.

The E. fields at the present day are the territory still called the United States of America, the British colonies in America, and the colonies in South Africa, Australia, and New Zealand. There is a great distinction to be taken between colonies fit for E. and those dependencies of the British crown held for other purposes. India, for instance, the greatest dependency of the crown, is totally unsuited for emigration. The British people who go there, with the exception of a few merchants, go to form the civil and military staff which rules the country. They stay there no longer than they can help, and instead of living on from generation to generation, send home their children in early youth, families of British origin having a tendency to degenerate, both physically and mentally, by long residence there. It is useless for working-people to go there, as every kind of work is done in some way or other by the natives much cheaper than it could be by Europeans, and the same may be said of every colony in the hot latitudes.

As a question in political economy, opinions about E. have oscillated violently. At one time it has been prohibited, at another encouraged by all kinds of tempting offers held out to emigrants, while teachers of political economy have proclaimed that there can never be too much emigration. The conclusion to which we are coming in this, as in so many other questions in political economy is, that what is good for the individual members of a community is good for the community collectively—if people can improve their condition by emigrating, it is as well that they should emigrate; but if otherwise, they had better stay at home. It might seem unnecessary to promulgate a doctrine which every man's self-interest should teach him, but unfortunately E. is one of the matters on which the populace have been liable to delusions which have produced great mischief. Sometimes poor workmen have crowded in where labor was superabundant and capital deficient; at others, men have taken their capital to districts where there was no employment for it, and the unnaturally high price of the necessaries of life has immediately absorbed it all. Young gentlemen, with nothing but showy accomplishments, have gone to the backwoods of America, where they could only prosper by ceaseless toil in felling and clearing. Ambitious, discontented artisans have wandered to the wide pastures of Australia, where they could only get a scanty subsistence as hut-keepers or assistant shepherds, not having skill enough to be intrusted with the charge of stock. Such mistakes have originated from people's ignorance of the fate of those who have gone before, it being generally taken for granted that the emigrant has gone away for his benefit, whereas it has often been for his ruin, and to meet an untimely death.

The standard difficulty is the want of adjustment of capital to labor. This is enhanced by the circumstance, that those who wish to emigrate are generally persons feeling the pressure of poverty at home. The man, however, who goes to a place where there is no capital to employ him with—either his own or some other person's—is just in the position of a shipwrecked mariner cast on the shore. Government interference has been found necessary for the protection of emigrants. Before he leaves his own country, the intending emigrant, through means of agents, cannot only be shipped for a distant port, but can contract for his removal inland to his final place of settlement, and can even contract for the purchase of a plot of ground, or for the sale of his labor. The temptations and the opportunities for imposition in contracts to be fulfilled so far away from the place where they are undertaken, are obvious, and the instances of cruelty and rapacity exhibited in the E. trade are among the most atrocious that have ever disgraced human nature. These led to the appointment of a department of government called the E. commission, and to the passing of the passengers' act of 1849, which regulates the build and character of the vessels which may carry emigrants to certain points, limits the number that may be conveyed, requires the sufficiency of the provisions and other stores to be certified, and provides for proper medical attendance. The British government cannot, of course, enforce obedience to their regulations in vessels belonging to citizens of the United States, after these have gone to sea; but before allowing such vessels to receive emigrants, the owners must find security in this country for the performance of their undertakings, and to a considerable extent the American government has co-operated with ours for the protection of emigrants.

The greatest amount of E. from any one country is from the United Kingdom. There is also a continual stream of E. from Germany, which has formed several separate German communities in the States of America, and also in the British colonies there, and in Australia. A new kind of E., which has come under the charge of the British authorities, is that of hill coolies from India, and of Chinese, both for the purpose of supplying free labor in the sugar-growing and other tropical colonies where Europeans cannot work with safety. A difficulty which more or less attends all kinds of E. is peculiarly felt in this kind—that of keeping the two sexes nearly equal.

The "thirty-fourth report of the E. commissioners" is for the year 1872. The commissioners state that, as the administration of the passenger act has been transferred to the board of trade, it is the last report which they shall have to make on E. from this country. The following table shows the number and nationality of emigrants from the United Kingdom in 1870, 1871, and 1872:

	English.	Scotch.	Irish.	Foreign.	Not Distinguished.	Total.
1870	105,203	22,935	74,283	48,396	6,033	256,940
1871	102,452	19,232	71,067	53,246	6,438	252,435
1872	118,190	19,541	72,763	79,023	5,696	295,213

The E. of 1872 was the largest since 1854, and exceeded the average E. of the previous 17 years by 109,971. But it included a large proportion of foreigners who emigrated through this country—the number of whom was inconsiderable before 1864—and the real excess of the British E. of 1872 over the average of the preceding 17 years was only 53,521. Of the emigrants from our own population in 1872, the English were 56.15 per cent; the Scotch, 9.28 per cent; and the Irish, 34.57 per cent. The proportion of English to Irish emigrants in 1872 was as under:

	English.	Scotch.	Irish.	Foreign.	Not Distinguished.	Total.
United States, North America	82,339	12,691	66,752	68,137	3,828	223,747
British North American colonies	16,691	4,254	3,437	7,805	18	32,205
British Australian colonies	11,611	1,571	2,066	610	18	15,876
All other places	7,549	1,025	508	2,471	1,832	13,385
Totals	118,190	19,541	72,763	79,023	5,696	295,213

In the 58 years, from 1815 to 1872 inclusive, there left the United Kingdom 7,561,285 emigrants; of whom 4,906,262 went to the United States of America; 2,473,173 to British colonies; and 182,850 to other places. The average annual E. was 130,366 for the 58 years ending 1872; 230,223 for the 10 years ending 1872; and 206,556 for the 24 years ending 1876. Of a total of 138,222 emigrants from the United Kingdom in 1876, 109,469 were distinguished as of British origin.

EMIGRATION (*ante*). See IMMIGRATION.

EMIGRATION OF PAUPERS. The manifest advantages derivable both to themselves and the community which supports them from the emigration of paupers, and more particularly of pauper children, to the colonies, have led to several legislative provisions on the subject. The object of these enactments is, on the one hand, to facilitate pauper emigration, and, on the other, to prevent it from being pressed on paupers by the guardians to the extent of interfering with their personal freedom of choice. By 4 and 5 Will. IV. c. 76, s. 62, parishes in England and Wales are empowered to raise funds by a yearly rate for defraying the expenses of poor persons willing to emigrate. The sums advanced may be recovered from any person above the age of 21, who (or whose family or any part thereof), having consented to emigrate, shall refuse to do so, or who having emigrated, shall return. 11 and 12 Vict. c. 110, empowers the guardians of a parish to promote the voluntary emigration of the poor who are irremovable, in accordance with the provisions of the statute above cited, and to charge the expenses upon the ordinary funds for the relief of the poor. By 12 and 13 Vict. c. 103, s. 20, guardians are empowered to expend a sum not exceeding £10 for each person, on the emigration of paupers having settlements in their union or parish, without a previous vestry meeting. 13 and 14 Vict. c. 101, s. 4, enacts that it shall be lawful for the guardians of any parish or union to expend money in the emigration of any poor orphan or deserted child under the age of 16 years, having no settlement, or the place of whose settlement is unknown, and to charge the expense so incurred to the same parish to which such orphan or deserted child was chargeable at the time of the emigration. The section concludes with the provision, that no emigration of any such orphan or deserted child, under any of the above-mentioned powers, shall take place until such orphan or deserted child shall have consented thereto before the justices assembled in petty sessions, and a certificate of such consent, under the hands of two of the justices present thereat, shall have been transmitted to the local government board.

These statutory provisions do not apply to Scotland, and there are no corresponding clauses in the Scottish acts, except in the drainage and improvement acts of Scotland, 14 and 15 Vict. c. 91, and 19 and 20 Vict. c. 9, which enabled owners of lands in the highlands and islands of Scotland to ask grants of money to assist emigration of the poor population. This was allowed on inquiry, and with consent of the board of supervision, the owner paying part of the expense. But parishes generally have no similar powers. Directors of ragged schools are prevented from trying the experiment of sending the children to the colonies, by want of funds, as well as by want of arrangements for their reception on arrival.

ÉMIGRÉS, the name given more especially to those persons who quitted France during the revolution. After the insurrection at Paris, and the taking of the Bastile, 14th July, 1789, the princes of the royal family departed from France. They were followed, after the

adoption of the constitution of 1791, by all who considered themselves aggrieved by the destruction of their privileges, or who were exposed to persecution. Nobles quitted their châteaus; officers, with whole companies, passed the frontiers. Crowds of priests and monks fled to escape the oath of allegiance to the constitution. Belgium, Piedmont, Holland, Switzerland, and, above all, Germany, were overrun with fugitives of every age. Only a few had been able to save their property; the greater portion were in a state of destitution, and sank into utter demoralization. A court had formed itself round the princes at Coblenz; a government, with ministers and a court of justice, had been established, and communication was kept up with all the foreign courts unfavorable to the revolution. This conduct imbittered France, aggravated the position of the king, and drove the revolutionary party forward in their sanguinary career. Under the command of the prince of Condé, a body of É. was formed, which followed the Prussian army into Champagne. The result was that the severest laws were now put in force against the émigrés. Their lands were confiscated. The penalty of death was proclaimed against any one who should support or enter into communication with them. Thirty thousand persons were placed upon the list of É., and exiled forever from the soil of France, although many of them had refused to bear arms against their country. Not until after the failure of their attempt to land at Quiberon in 1795, did the É. abandon all thoughts of penetrating into France by force of arms. Condé's corps, after the peace of Luneville, was obliged formally to dissolve, and sought an asylum in Russia. Even under the directory, however, many had endeavored to obtain permission to return to France. The general amnesty proclaimed by the first consul was therefore joyfully hailed by the greater portion of the émigrés. Many, however, did not return home till after the downfall of Napoleon. Dignities, pensions, and offices were now showered upon these faithful adherents; but, according to the charter of 1814, they were unable to recover either their estates or their privileges. Finally, on the motion of the minister Villèle, the É. who had lost their landed estates, by the law of the 27th April, 1825, received a compensation of 30 million francs yearly on the capital of 1000 million francs. After the July revolution, however, the grant was withdrawn. Compare Antoine de Saint-Gervais, *Histoire des Émigrés Français* (3 vols., Paris, 1823), and Montrol, *Histoire de l'Emigration* (2d edit., Paris, 1825).

EMIL'IAN (or ÆMILIAN) **PROVINCES**, a name now employed to designate a portion of the recently formed kingdom of Italy, comprising the northern part of the states of the church (the Romagna), and the duchies of Parma and Modena. The name is derived from the ancient *Via Æmilia* (a continuation of the *Via Flaminia*, or great northern road), which passed through these territories. The E. P. were formally annexed to Sardinia in April, 1860. See ITALY.

EMINENCE, a title given to cardinals by Urban VIII. Up to the period of his pontificate, they had been called most illustrious and most reverend. The assumption by the Roman Catholic clergy of this and other ecclesiastical titles, not having reference to any "pretended province, or to any pretended see or diocese," are not struck at by the act 14 and 15 Vict. c. 49, to prevent the assumption of certain ecclesiastical titles in respect of places in the United Kingdom. See ECCLESIASTICAL TITLES ASSUMPTION ACT.

EMINENT DOMAIN, the original ownership retained by the state, by which land or other private property may be taken for public use or benefit. It is the highest and most exact idea of property remaining in the government, or in the aggregate body of the people in their sovereign capacity, giving the right to resume possession in the manner directed by law. If the proper authorities propose to open a street, or charter a railroad, or set apart land for a park, or for any lawful and reasonable purpose, and the owner of lands in the route or space desired refuse to sell or ask an unreasonable price, the state by eminent domain has the power of control, and process may be issued from a court having authority to compel the surrender of the property. The constitution of the United States limits the exercise of this right to cases where the public good demands it, and requires compensation to those from whom the property is taken. These conditions are also named by many of the state constitutions.

E'MIR, an Arabic word, equivalent to "ruler," is a title given in the east, and in the n. of Africa, to all independent chieftains, and also to all the actual or supposed descendants of Mohammed through his daughter Fatima. The latter are very numerous throughout the Turkish dominions, but although entitled by birth to be classed among the first four orders of society, they enjoy no particular privileges or consideration; on the contrary, they are found engaged in all sorts of occupations, and are to be met with among beggars, and the lowest of the populace, as frequently as among the mollahs. Their privileges are confined to a few unimportant matters, chiefly to the exclusive right to wear turbans of a green color, that having been the favorite color of the prophet. They are placed under the supervision of the emir-beshir. In former times, the title of emir was borne by the leaders in the religious wars of the Mohammedans, as well as by several ruling families, such as the Thaherides and Samanides in Persia, the Tulunides in Egypt, the first seven Ommaiades in Spain. The title emir, in connection with other words, likewise designates different offices. *Emir-al-Mumenin*, "prince of the faithful," is the title assumed by the caliphs themselves; *emir-al-mus-*

lemin, signifying the same thing, was the title of the Almoravides. *Emir-al-Omrah*, "prince of princes," was the title of the first minister, under the caliphs and the East Indian Moguls, who united in his own person the highest civil and military dignities. It is now the title of the governors of different provinces. The Turkish master of the horse is styled *emir-achor;* the standard-bearer, *emir-alem;* and the leader of the caravans of pilgrims to Mecca, *emir-hadji*. *Ameer* or *amere* is another spelling of the same word.

EMILY, an Irish see, united to Cashel in 1568.

EMMAN'UEL, EMANUEL, or IMMANUEL, a Hebrew name, whose signification—"*God with us*"—is not, by itself, proof that he to whom it would be given was divine. This and similar combinations of divine names were, and still are, in ordinary use among Jews. But the evangelist Matthew (i. 23) applies it in a special manner to the child Jesus; and the whole history of the nativity is in harmony with the special application. Some Christian interpreters consider that the reference (Is. vii. 14) to the birth of the Messiah is direct and exclusive. But the prophecy itself and the circumstances in which it was spoken evidently call for a speedy fulfillment according to the ordinary laws of nature, the virgin being one whom the prophet was commanded then to marry, and her son the child spoken of, under another name, in the eighth chapter. Yet, besides this, as many interpreters believe, the prophecy was designed to have a secondary and full accomplishment in the miraculous conception and birth of Jesus Christ from his virgin mother. This is proved not simply by Matthew's application of the prophecy and by the New Testament account of the nativity, but also by the whole subsequent exhibition of the character and work of Jesus in attestation of his claim to be the incarnate Son of God.

EMMANUEL COLLEGE, CAMBRIDGE, was founded in 1584 by sir Walter Mildmay, chancellor of the exchequer and privy-councilor in the reign of queen Elizabeth. The foundation fellowships are thirteen in number. These fellowships are open to all her majesty's subjects, and a candidate becomes eligible to them on proceeding to the degree of B.A. or any equivalent degree. All the foundation fellows are obliged to proceed regularly to the further degree in arts, law, medicine, or any other faculty they have selected. There must be four of them always in priest's orders; and any who are not tutors or bursars in the college, are bound to be in orders at the end of the seventh year of their fellowship, at the risk of forfeiting it three years afterwards. The college also possesses two fellowships and four scholarships on sir Wolstan Dixie's foundation (but the Dixie fellows have no voice in college affairs, nor any claim to the offices or dividends of the college); 21 scholarships (13 of £70 a year, 5 of £30, and 3 minors of £70), paid from the general revenues of the college; five of £30 a year, founded by Dr. Thorpe; and other seven (4 of £35, 2 of £50, and 1 of £16), for which candidates from certain schools have a preferable claim. The patronage of the college consists of 24 benefices, situated in the eastern and south-western counties of England; and of two schools, one in Norfolk, and the other in Suffolk. This college had in 1879, 313 members of senate, 107 undergraduates, and about 370 members on the boards.

EMMEN'AGOGUES, medicines intended to restore, or to bring on for the first time, the menstrual excretion in women. The E. chiefly in use are the preparations of aloes, iron, myrrh, and other stimulants in connection with purgatives; and also the local use of the warm bath, leeches, fomentation, etc. Some recommend still more powerful and direct applications to the uterine mucous membrane; as galvanic pessaries, lunar caustic, scarifications, etc.; but these are not in general use. See MENSTRUATION.

EM'MERICH, a t. of Rhenish Prussia, is situated on the right bank of the Rhine, on the borders of Holland. It is a very old town, and has a Dutch character of cleanliness. It has a custom-house, an orphan-house, a gymnasium, and several churches. E. has manufactures of tobacco, chocolate, leather, and liquors. Pop. '75, 8,117.

EMMET. See ANT.

EMMET, ROBERT, 1788–1803; b. Dublin, a school-fellow and college-mate of Moore, the poet. Both were members of the historical society, and ardent champions of the cause of freedom for Ireland. In 1798, Emmet was expelled from the university on account of his connection with the United Irishmen. He went to the continent, where he remained until 1802; then returned secretly to Dublin and endeavored to plan a general revolution. July 23 of that year, he made an attempt to seize the arsenal and city of Dublin; but his mob of followers created scarcely a serious riot, flying in panic at the first firing by the police. Finding his revolution a miserable failure, Emmet hid himself in the Wicklow mountains, intending to escape to the continent, but he delayed long enough to have an interview with the daughter of Curran, the famous advocate, with whom he was in love, and this delay led to his arrest. He was tried for treason, convicted, and executed Sept. 20, 1803. His speech, on being asked why sentence should not be pronounced, has long been held up as a model of patriotic eloquence.

EMMET, THOMAS ADDIS, LL.D. 1764–1827; b. Cork; brother of Robert. He was educated in Trinity college, Dublin, and studied medicine in Edinburgh, and visited the medical schools of the continent. In 1788, he gave up medicine, and took to the study

of law, being admitted to the Dublin bar in 1790. He was involved as counsel and as leader of the United Irishmen, and in Mar., 1798, he, with others, was arrested. He was kept a prisoner until June, 1802, and then received freedom on agreeing to leave the country. He went to Hamburg and to Brussels, and, in 1803, to France, where he had an interview with Napoleon, who was at that time contemplating an invasion of England. In 1804, he came to New York, where he soon gained a large law practice, and received much attention as a political exile. In 1812, he was attorney-general of New York state, but served only six months.

EMMETT, a co. in n. Iowa, on the border of Minnesota; 432 sq.m.; pop. '75, 1436. It is undulating, with fertile soil, and contains a number of small lakes. Co. seat, Estherville.

EMMETT, a co. in n. Michigan, in the peninsula bordering on Mackinaw straits and lake Michigan, traversed by the Grand Rapids and Indiana railroad; 430 sq.m.; pop. '74, 1272. The surface is undulating and the soil fertile, mostly of prairie; productions agricultural. Co. seat, Little Traverse.

EMMITTSBURG, or EMMETTSBURG, a village in Frederick co., Md., 61 m. n.w. of Baltimore, by the Western Maryland railroad, and 10 m. s.w. of Gettysburg, Penn. It is noted principally as the seat of Mount St. Mary's college, the largest Roman Catholic educational institution in the United States, established in 1809. Near by is St. Joseph's academy, the mother-house of the sisters of charity in this country. The village has about 800 inhabitants, besides students.

EMMONS, EBENEZER, 1799-1863; b. Mass.; professor of natural history in Williams college, 1833, and of chemistry in Albany medical college, 1838. In 1836, he was one of the commission to make a geological survey of New York, and in 1856, became state geologist of North Carolina. He wrote text books and reports on mineralogy and geology.

EMMONS, GEORGE F., b. Vt., 1811; midshipman 1828, and rose to rear-admiral in 1872. He was in the Wilkes exploring expedition, and off the Mexican coast during the war with that country. In the war of the rebellion he commanded blockading vessels, and was in Dahlgren's fleet; and from 1864 to the close of the war, he commanded a division of the blockading fleet in the gulf of Mexico.

EMMONS, NATHANAEL, D.D., was b. at East Haddam, Conn., in 1745, and graduated with honor at Yale college, in 1767. He began his theological studies with Rev. Nathan Strong, of Coventry, Conn., and continued them with Dr. John Smalley, of Berlin, Conn., who had been a pupil of Bellamy. In 1773, he was ordained pastor of the Congregational church in Franklin, Mass., and continued in the office 54 years. In this church, during and after his pastorate, he rejoiced over five revivals of religion, and received into communion about 400 persons who, almost without exception, were through life consistent Christians. He superintended the studies of nearly 100 young men in preparation for the ministry, many of whom became strong and useful preachers; some of them were distinguished as professors in colleges and theological seminaries; and about 50 have a place in published accounts of eminent men. He was one of the originators of the Mass. missionary society, and one of the editors of its missionary magazine from which the *Missionary Herald* grew. When masonry was popular he zealously opposed it; when the anti-slavery movement was denounced he actively favored it. He was a decided "Federalist," and caused great excitement by his political writings. As an author and preacher he exerted a very great influence on the churches. During his life he published 4 elaborate dissertations, more than 100 magazine articles, and about 200 sermons, of which 7,000 copies were issued. He preached about 6,000 times. At his death a part of his sermons was published in 7 octavo volumes, and a new edition, enlarged, in 6 volumes. About 75 years of his life were spent in earnest and systematic study, during the greater part of which time he read and wrote 10, 12, and sometimes 14 hours a day. He has been described by those who knew him well as "methodical, temperate, regular in his habits, distinguished for punctuality, precision and sharpness of mind, keen analysis, self-consistency, wit, frankness, honesty, and reverence for the truth. As a Calvinist he wished to be considered neither "high" nor "low," but consistent. On one Sabbath he would present the doctrine of divine sovereignty with such strength that some might think him a fatalist; the next Sabbath he would advocate free will so powerfully that some might call him a Pelagian; and in a third sermon he would lay out his strength in showing that the sovereignty of God was not inconsistent with the free-agency of man. He steadily adhered to old usages and wore the antique dress and three-cornered hat as long as he appeared in public. He lived to his 96th year, retaining the strength of his faculties to the last, and died with an unfaltering faith in Christ.

EMOLLIENTS (from Lat. *mollis*, soft), substances used to soften the textures to which they are applied, as poultices, fomentations, etc., externally, and demulcents (q.v.), internally.

EMORY, JOHN, D.D., 1789-1835; b. Md.; brought up to the law, but became a Methodist preacher in 1810. In 1820, he was a delegate to the British Wesleyan conference; in 1824, book agent of his church at New York, and in 1832, was chosen bishop. He

wrote *The Divinity of Christ Vindicated; Defense of our Fathers;* and other works on religious subjects.

EMORY, ROBERT, D.D., 1814–48; son of John; president of Dickinson college; author of a life of his father, and *History of the Discipline of the Methodist Episcopal Church.*

EMORY, WILLIAM H., b. Md., 1811; a graduate of West Point; in 1863, col. of cavalry, and in 1865, maj.gen. of volunteers. He served with credit in the war of the rebellion.

EMOTION. This is the name for one of the comprehensive departments of the human mind. It is now usual to make a threefold division of the mind—E., or feeling; volition, or action prompted by feelings; and intellect, or thought. It is not meant that these can be manifested in absolute separation; or that we can be at one time all E., another time all volition, and again all thought, without either of the other two. But although our living mind is usually a concurrence, in greater or less degree, of all of them, still they can be distinguished as presenting very different appearances, according as one or other predominates. Wonder, anger, fear, affection, are emotions; the acts that we perform to procure pleasurable feelings, and avoid painful, are volitions, or exercises of will; memory and reasoning are processes of thought, or intellect.

E. is essentially a condition of the waking, conscious mind. When asleep, or in a faint, or in any of those states called "being unconscious," we have no E.; to say that we have would be a contradiction, which shows that "emotion" is a very wide and comprehensive word. In fact, whenever we are mentally excited "anyhow," we may be said to be under emotion. Our active movements and intellectual processes can sometimes go on with very little consciousness; we may walk and scarcely be aware of it; trains of thought may be proved to have passed through the mind while we are unconscious of them. Now, it is these unconscious modes of volition and intellect that present the greatest contrast to E.; showing how nearly co-extensive this word is with mental wakefulness, or consciousness, in its widest signification.

E., then, is of the very essence of mind, although not expressing the whole of mind. There are three distinct kinds or divisions of it: pleasures, pains, and excitement that is neither pleasurable nor painful.

Every kind of pleasure is included under E. in its widest acceptation. The pleasures of the senses are as much of an emotional character as those pleasures that are not of the senses—as, for example, those of power, pride, affection, malevolence, knowledge, fine art, etc. Every one of our senses may be made to yield pleasurable E.; and all those other susceptibilities, sometimes called the special emotions, of which a classification is given below, are connected with our pleasures or our pains. What pleasure is in its inmost nature, each one must find from his own experience; it is an ultimate fact of the human consciousness which cannot be resolved into anything more fundamental, although, as will be seen, we can lay down the laws that connect it with the other manifestations of mind—namely, action and thought, and with the facts of our corporeal life.

In the next place, pain is a species of emotion. We know this condition as being the opposite of pleasure, as the source of activity directed to its removal or abatement, and as the cause of a peculiar outward appearance, known as the expression or physiognomy of pain. All the inlets of pleasure are also inlets of pain. The various sensibilities of the mind, whether the outward senses, or the more inward emotions, give rise at one time to pleasure, at other times to pain, the conditions of each being generally well understood by us; we can define the agencies that cause pleasure or suffering through the skin, the ear, or the eye.

But it is requisite, further, to recognize certain modes of neutral excitement, in order to exhaust the compass of emotion. We are very often roused, shocked, excited, or made mentally alive, when we can hardly say that we are either pleased or put to pain. The mind is awakened and engrossed with some one thing, other things are excluded; and the particular cause of the excitement is impressed upon us so as to be afterwards remembered, while all the time we are removed alike from enjoyment and from suffering. This is a kind of E. that has its principal value in the sphere of intellect. The E. of wonder or astonishment is not seldom of this nature; for although we sometimes derive pleasure, and sometimes the opposite, from a shock of surprise, we are very frequently affected in neither way, being simply *impressed.* The strange appearance of a comet gives far more of this neutral effect than of the others. It is a thing that possesses our mind at the time, and is afterwards vividly remembered by us, and these are the chief consequences of its having roused our wonder.

The physical accompaniments of E. are a part of its nature. It has been remarked in all ages, that every strong passion has a certain outward expression or embodiment, which is the token of its presence to the beholder. The child soon learns to interpret the signs of feeling. Joy, grief, affection, fear, rage, wonder, have each a characteristic expression; and painters, sculptors, and poets, have adopted the demeanor of passion as a subject for their art. There must be some deep connection in the human

frame between the inward states of consciousness and the physical or corporeal activities, to produce results so uniform throughout the human race. When we study the facts closely, we obtain decisive proof of the concurrence of the following members and organs in the manifestation of feeling.

In the first place, the *muscles* or *moving organs* are affected. Under strong excitement, the whole body is animated to gesticulation; in less powerful feelings, the expression confines itself more to the *features* or the movements of the face. These last have been analyzed by sir Charles Bell. The face has three centers of movement—the mouth, eyes, and nose; the mouth being most susceptible, and therefore the most expressive feature. In the eyes, expression is constituted by the two opposite movements of the eyebrows; the one raising and arching them (prompted by a muscle of the scalp, *occipito-frontalis*), the other corrugating and wrinkling them. The one movement is associated with pleasing states, the other with painful. The nose is acted on by several muscles, the most considerable of which is one that raises the wing together with the upper lip, and is brought into play under the disgust of a bad smell and in expressing dislike generally. The mouth is principally made up of one ring-like muscle (*orbicularis*), from which nine pairs radiate to the cheeks and face. In pleasing emotions, the mouth is drawn out by the action of two pairs of muscles, named the buccinator and zygomatic, situated in the cheek. The expression of pain is determined by the contraction of the aperture of the mouth, through the relaxation of those muscles, and the contraction of the ring-like muscle that constitutes the flesh of the lips; and by two muscles in the chin, one depressing the angle of the mouth, and the other raising the middle of the lower lip, as in pouting. Besides the features, the voice is instinctively affected under strong feelings; the shouts of hilarious excitement, the cry of sharp pain, and the moan of protracted agony, are universally known. Another important muscle of expression is the diaphragm, or midriff, a large muscle dividing the chest from the abdomen, and regularly operating in expiration. In laughter, this muscle is affected to convulsion.

In the second place, the *organic functions* of the system are decidedly influenced for good or evil under emotion. The glandular and other organs acted on in this way comprehend the most important viscera of the body. The lachrymal secretion is specifically affected under passion; the flow of tears being accelerated to a rush, instead of pursuing the tranquil course of keeping the eyeball moist and clean. The states of the sexual organs are connected with the strongest feelings of the mind, being both the cause and the effect of mental excitement. The digestion is greatly subject to the feelings, being promoted by joy and hilarity, not in too great excess, and arrested and disturbed under pain, grief, terror, anger, and intense bodily or mental occupation. The skin is known to respond to the condition of the mind; the cold sweat in fear is a derangement of its healthy functions. The respiration may be quickened or depressed according to the feelings. The action of the heart and the circulation of the blood are subject to the same causes. The nature of this influence was explained under BLUSHING. Lastly, in women, the lacteal secretion participates in the states of E., being abundant, healthy, and a source of pleasure in a tranquil condition of mind, while grief and strong passions change it to a deleterious quality.

The connection between mental E. and bodily states being thus a fact confirmed by the universal experience of mankind, can we explain this connection upon any general law or principle of the human constitution? Have we any clue to the mysterious selection of some actions as expressing pleasure, and others as expressing pain? The reply is, that there is one principle or clue that unravels much of the complexity of this subject—namely, that *states of pleasure are usually accompanied with an increase in some or all of the vital functions, and states of pain with a depression or weakening of vital functions.* This position may be maintained on a very wide induction of facts, many of them very generally recognized, and others open to any careful observer; there being, however, some appearances of an opposite kind, which have to be satisfactorily accounted for, before we can consider it as fully established.

If we consider first the respective *agents* or causes of pleasure and pain, we must acknowledge that they are very generally of a nature to accord with the view now stated. How many of the sources of pleasure are obviously sources of increased energy of some vital organs. The case of food is too obvious to need any comment. Warmth within limits both confers pleasure and stimulates the skin, the digestion, and other functions. Fresh air exhilarates the mind, while quickening the respiratory function. Light is believed to stimulate the vital actions no less than the mental tone. And if there be some pleasures of sense, such as mere sweetness of taste, fragrant odors, music, etc., that do not obviously involve greater energy of vital function, they might be seen to do so, if we knew more than we do respecting the operation of the various organs, and we are certain that they do not have the opposite effect. Medical authorities are so much impressed with the general tendency of pleasures, that they include them in the list of *stimulants* in cases of low vitality. If we pass from the senses to the special emotions, such as wonder, power, tender affection, taste, we find that when those are pleasing, they also increase the animal forces at some point or other. A stroke of victory sends a thrill through the whole system; and if the pulse were examined at that moment, we should find that it beats stronger. The illustration for pains is exactly parallel, but still more striking. It is notorious that hurts, wounds, fatigue, ill-health, hunger, chillness,

nauseous tastes and odors, the silence of a prison, the gloom of utter darkness, failure, humiliation, contumely, deprivation of one's usual comforts and pleasures—while causing pain, cause in a corresponding degree a depression of the powers of the system. There are some apparent exceptions, as in the stimulus of the whip, the bracing agency of cold, and the effect of misery generally in rousing men from lethargy to action, but these could all be shown to be quite compatible with the main principle.

If we turn from the agents to the *expression*, or modes of manifestation, of the opposing mental conditions, we shall find that the facts are of the same general tenor, although with some seeming exceptions. Joy makes a man spontaneously active, erect, animated, and energetic. It is as if a flush of power were diffused through his members; and the efforts he is then prompted to, lead to no painful exhaustion. The opening up of the features, by the elevation of the eyebrows and the retraction of the mouth, indicates that the stream of energy has coursed over the face. In a still greater shock, the convulsiveness of laughter, by which respiration is quickened, attests the superabundance of the animal spirits. The body stands more erect, and every act done is done with more emphasis. Grief and depression are the opposite in every particular. The frame is languid and stooping, the features lifeless, the voice is a feeble wail; and although there is a species of convulsion attending on this condition of mind, it is a marked contrast to the other. The sob is caused by the *partial paralysis* of the diaphraghm, which necessitates great voluntary efforts in order that the breathing may proceed. The choking sensation at the throat is also a species of paralysis from loss of vital power. The convulsions arising under such circumstances are productive of an exhausting reaction, which is the case with all the energetic movements stimulated by extreme action.

Such is undoubtedly the general fact. But why should pain stimulate, or give strength to, *some special* muscles, such as the corrugator of the eyebrow, and the depressor of the angle of the mouth? This has appeared a great difficulty to the ablest physiologists. It would look as if pleasure coincided with an energetic wave sent to some muscles, and pain with an energetic wave sent to others; so that the opposite conditions of mind are equally accompanied by an accession of power to some bodily member. But if we examine the matter more narrowly, it will probably turn out that the muscles that seem to be stimulated under pain, are not so in reality, but obtain the upper hand through the general relaxation of the system. Thus, take the mouth. We know the state of the mouth in languor, inaction, and sleep. We know that when we are roused in any way, the muscles of the face operate and draw the mouth asunder in a variety of forms. Pleasure corresponds with our energetic moods, pain causes a collapse towards the sleepy and exhausted condition which represents a state of departed energy. So the collapse of the body might seem an exertion of the *flexor* muscles, or those that bend the frame forward; but we are well aware that such collapse takes place when the system is totally lifeless. A renewed energy, as a matter of course, makes us stand erect.

This is a part of the case in reply to the objections arising from a specific expression of pain, but not the whole; and the answer to the difficulties still remaining is furnished by a fact that, if well authenticated, will probably dispose of nearly all the exceptions to the general principle now contended for. It is the organic functions, *more than the muscular system*, whose increased vitality coincides with pleasurable feeling, and their diminished action with pain. Muscular exercise is often highly agreeable, but the pleasure of *resting* after exercise is still more so. Now, there can be little doubt that what happens in the state of healthy repose is this: the amount of vital force stimulated by exercise—the increased energy derived from plying the lungs and heart—is now allowed to leave the active members, and to pass to the other organs—the digestion, skin, and various secreting glands—and it is their aggandizement that is associated with the comfortable sensations of repose and sinking into sleep. Thus, the abating of muscular energy may be a cause of pleasure, provided the organic functions are raised in consequence; but it may be maintained as a highly probable supposition, that a certain health and energy of some or all of these functions (it is difficult to draw a specific line) is essential to pleasurable feeling. We may doubt whether even mental causes can materially raise the tone of enjoyment, if they do not also raise the activity of some of these organs. Not only may a person be very happy and comfortable in the prostration of the muscular energy, even in a sick bed, but one way of procuring comfort is to induce a total inaction of the moving members, to allow all the available nervous power to pass to the viscera and secretions. Hence a *forced relaxation* of the muscles *generally*, by the employment of *some* of them, is a means of soothing the mind under pain. Thus, the active intervention of certain small muscles—such as the corrugator of the eyebrows, the orbicular muscle of the mouth, and the depressor of the angle of the mouth—by relaxing a much greater body of muscle, is the means of setting free vital energy for behoof of the other parts of the system. This would explain the mental relief furnished by an assumed sadness of feature, and a voluntary collapse of the body generally.

It would appear, then, that the stimulus of muscle is not necessarily or immediately a cause of pleasure; while the stimulus of the organic functions is so. Thus, a bracing cold quickens the activities, but is apt to cause a shock of pain, by temporarily checking the action of the skin; when the reaction arrives, this check is converted into stimula-

tion, and the mental state is altered in like manner. A bitter tonic must be supposed to act on the same principle.

The emotions of the human mind may be classified under two heads:

First—The pleasures, and pains, and modes of excitement growing out of the exercise of the senses, the movements, and the appetites. See SENSES. The five senses, commonly recognized, are partly sources of pleasure and pain, in which case they yield emotion, and partly sources of knowledge, by which they are related to the intellect. There are other sensibilities not included in the five senses, but ranking with them in those particulars—as the feelings of muscular exercise and repose, and the sensations of digestion, respiration, etc.

The second head comprises the special emotions not arising immediately out of sensation, although connected therewith. These have been variously classified. The following is one mode of laying them out: 1. Feelings of liberty and restraint; 2. Wonder; 3. Terror; 4. Tender affections; 5. Emotions of self-complacency, love of approbation, etc.; 6. Sentiment of power; 7. Irascibility; 8. Emotions of action, including the interest of pursuit or plot; 9. Emotions of intellect, love of knowledge, consistency, and Inconsistency; 10. Fine art emotions, or taste; 11. The moral sense.

On this subject, see Müller's *Physiology, Movements due to the Passions of the Mind;* Bell's *Anatomy of Expression;* Stewart on the *Active Power;* Bain on the *Emotions and the Will,* etc.

EMPANEL.—*Empanellare vel ponere in assisis et juratis*—to write in a schedule or roll the names of such jurors as the sheriff returns to pass upon any trial. The judges of assize in England, before commencing their circuits, issue precepts to the sheriffs of the several counties, calling upon them to summon a sufficient number of jurors to serve upon the grand and petty juries. In compliance with this order, the sheriff prepares lists, called the panels (q.v.) of the jury, and the persons named in the lists are thereupon summoned to attend at the assizes.

EMPECINA'DO, DON JUAN MARTIN DIAZ, EL, one of the leaders of the Spanish revolution of 1820, was b. in 1775. He was the son of poor parents, and entered the Spanish army in 1792. At the head of 5,000 or 6,000 men, he carried on a guerilla warfare against the French during the Peninsular struggle, and acquired great distinction. In 1814, he was appointed col. in the regular army, and the king himself created him field-marshal; but in consequence of petitioning Ferdinand, in 1815, to reinstitute the cortes, he was imprisoned, and afterward banished to Valladolid. On the outbreak of the insurrection in 1820, he took a prominent part on the side of the constitutionalists, and on several occasions exhibited great courage, daring, and circumspection. After the triumph of the absolutists in 1825, he was arrested, exposed in an iron cage to the contumely of the passers-by, and finally executed on a common gibbet, amidst the ferocious yellings of a debased and liberty-hating populace.

EMPED'OCLES, a Greek philosopher of Agrigentum, in Sicily, lived about 450 B.C. So great was the estimation in which he was held by his fellow-citizens as a physician, a friend of the gods, a predicter of futurity, and a sorcerer, or conjuror of nature, that they are said to have offered him the sovereignty. But being an enemy of tyranny, he declined it, and was the means of delivering the community from the dominion of the aristocracy, and bringing in a democracy. There was a tradition that he threw himself into the crater of Etna, in order that his sudden disappearance might beget a belief in his divine origin; this, however, can only be regarded as a mere fable, like the story told by Lucian, that Etna threw out the sandals of the vain philosopher, and thus destroyed the popular belief in his divinity. The statement of Aristotle is, that he died at the age of 60; later writers extend the period of his life considerably further, but their testimony is not equal in weight to that of Aristotle.

In E., philosophic thought is bound up with poetry and myth even in a higher degree than in Parmenides (q.v.). His general point of view is determined by the influence of the eleatic school upon the physical theories of the Ionic philosophers. He assumed four primitive independent substances—air, water, fire, and earth, which he designates often by the mythical names Zeus, Here, etc. These four *elements,* as they were called, kept their place till modern chemistry dislodged them. Along with material elements, he affirmed the existence of two moving and operating powers, love and hate, or friendship and strife, the first as the uniting principle, the second as the separating. The contrast between matter and power, or force, is thus brought out more strongly by E. than by previous philosophers. The origin of the world, or cosmos, he conceived in this way: In the beginning, the elements were held in a sort of blended unity, or *sphere,* by the attractive force of love; when hate, previously exterior, penetrated as a repelling and separating principle. In this process of separation, which gives rise to the individual objects of nature, he seems to have assumed a series of stages, a gradual development of the perfect out of the imperfect, and a periodical return of things to the elemental state, in order to be again separated, and a new world of phenomena formed. From the fragments that we possess of his didactic poem, it is not quite clear in how far he considered fire as the substratum of strife, and water as the substratum of love, and ascribed various creations to the predominance of one or the other of these principles. Of his opinions on special phenomena, may be mentioned his

doctrine of emanations, which proceeding from one thing enter into corresponding openings in other things. By this assumption in connection with the maxim, that like is known only by like, he thought to explain the nature of perception by the senses. He attempted to give a moral application to the old doctrine of the transmigration of souls, his views of which resembled those of Pythagoras. The fragments of E. have been edited by Sturz (2 vols., Leip. 1805), Karsten (Amst. 1838), and Stein (Bonn, 1852).

EMPEROR (Lat. *imperator*). The original signification of this, which in the modern world has become the highest title of sovereignty, can be understood only when it is taken in conjunction with *imperium*, which in the Roman political system had a peculiar and somewhat technical meaning. The imperium of a magistrate, be he king or consul, was the power which he possessed of bringing physical force into operation for the fulfillment of his behests. This power was conferred by a *lex curiata*, and it required this authorization to entitle a consul to act as the commander of an army. In the case of the kings also, the imperium was not implied in their election, but was conferred separately, by a separate act of the national will. "On the death of king Pompilius," says Cicero, "the *populus* in the *comitia curiata* elected Tullus Hostilius king, upon the rogation of an *interrex;* and the king, following the example of Pompilius, took the votes of the *populus*, according to their *curiæ, on the question of his imperium.*"—*Republic*, ii. 17. Now, it was in virtue of this imperium that the title imperator was given to its possessor. Far from being an emperor in the modern sense, he might be a consul or a pro-consul; and there were, in fact, many imperatores, even after the title had been assumed as a prenomen by Julius Cæsar. It was this assumption which gradually gave to the title its modern signification. In republican times, it had followed the name, and indicated simply that its possessor was *an* imperator, or one possessed of the imperium; now it preceded it, and signified that he who arrogated it to himself was *the* emperor. In this form it appears on the coins of the successors of Julius. After the times of the Antonines, the title grew into use as expressing the possessor of the sovereignty of the Roman world, in which sense *princeps* also was frequently employed. In the introduction to the *Institutes*, Justinian uses both, in speaking of himself, in the same paragraph. From the emperors of the west, the title passed to Charlemagne, the founder of the German empire. When the Carlovingian family expired in the German branch, the imperial crown became elective, and continued to be so till it ceased—Francis II., who in 1804 had declared himself hereditary emperor of Austria, having laid it down in 1806. In addition to the emperor of Austria, there are now in Europe the emperor of Russia and emperor of Germany, the latter of whom, was, on Jan. 18, 1871, proclaimed under this title within the hall of mirrors, in the palace of the French kings at Versailles, in the presence of the German princes, and the standards of the German army which was beleaguering Paris. In 1876 the queen of England assumed the title of empress of India, in addition to those which she bore previously.

EMPEROR MOTH, *Saturnia pavonia minor*, a moth of the same family (*bombycidæ*) with the silk-worm moth. The E. M. is the largest British lepidopterous insect. Its expanse of wings is about 3½ inches. Each wing is ornamented with a large eye-like glassy and transparent spot. The peacock moth (*S. pavonia major*) is the largest European species, and attains an expanse of 5 in. across the wings. The cocoons of the E. M. are remarkable for being formed internally of stiff convergent elastic threads, which readily permit the escape of the insect, but prevent the entrance of intruders. The cocoons of this genus of moths are invested with silk, which in China and India is collected for use. See SILK AND SILK-WORM.

EMPETRA'CEÆ. See CROWBERRY.

EMPHASIS. See ACCENT.

EMPHYSE'MA, an unnatural distension of a part with air. E. of the cellular texture often takes place in the neighborhood of wounds of the air-passages in the lungs, and is the consequence of an escape of air from these parts. E. of the lungs is the consequence either of distension or of rupture of the air-vesicles, especially on the surface. It is rarely that E. is produced otherwise than mechanically; but collections of fluid in a state of decomposition sometimes give out gases, which penetrate and distend the textures with which they are in contact.

EMPHYTEU'SIS (Gr. an implanting), in the Roman law, a perpetual right in a piece of land, for which a yearly sum was paid to the superior or original proprietor. The E. much resembled our feudal holdings, so much so, indeed, that Craig and other Scotch writers apply the term to them. The sum paid to the superior was called the *canon emphyteuticus*. The tenant handed down the right to his heirs, and was entitled to sell, but only on condition of giving the first offer to the dominus. The consent of the lord, however, was not necessary to entitle him to impignorate the emphyteuta for his debt. Justinian put the E. and the *ager vectigalis* on the same footing. The latter is the term applied to lands leased by the Roman state, by towns, ecclesiastical corporations, and by the vestal virgins. There were several ways in which the right of E. might cease. If the tenant died without heirs, it reverted to the dominus. He might also lose his right by injuring the property, by non-payment of his rent or public burdens, or by

alienation without notice to the dominus. It was, of course, also in his power to renounce it.

EMPIRE, EMPEROR (*ante*), denotes the territory and people whose sovereign bears the title of emperor or empress; a title which, since the time of Julius Cæsar, implies the possession of monarchial power in its highest form. During the middle ages and until a comparatively recent period the "Empire" in its strictest sense meant the "holy Roman empire" founded by Cæsar and Augustus, the last remnant of which was lost in 1806, when Francis II. of Hapsburg, archduke of Austria and king of Hungary and Bohemia, resigned his inherited imperial title and assumed that of emperor of Austria alone. The Roman empire, from A.D. 395, was divided into two parts, one of which was ruled from Rome, the other from Constantinople. In theory, however, the two were held to be parts of one empire, divided only for greater convenience of administration. This was fiction rather than fact, for the two parts were in perpetual conflict. An attempt to restore the unity of the two under Charlemagne, who in 800 was crowned emperor at Rome by pope Leo III., proved abortive. Two hostile lines of emperors arose, each claiming to be the one true succession from Augustus and Constantine. The imperial title fell low, until it was revived in the w. in 962 by Otto the great, from whose time there was an unbroken succession of German kings, who assumed the rank and right of emperors and were acknowledged as such by the church. Their power, however, did not extend beyond Germany and northern Italy, and it was hampered by many restrictions, which were aggravated as time went on, until after the peace of Westphalia, in 1648, when the empire was reduced to a mere federation of principalities and the imperial title became little better than a farce. The eastern empire was overthrown in 1453, when Constantinople was taken by the Turks. The empires now existing are those of Austria, Russia, Germany, Turkey, China, and Japan. The queen of England bears the title of empress of India.

EMPIR'IC (Gr. *empeirikos*, an experimentalist, or searcher after facts in nature, from *peirao*, I try). It is difficult to say at what period, or in what manner, this word began to degenerate from its original meaning. Probably the idea was, that empiricism, or experimental science, excluded, because it did not require, the reasoning faculties for its cultivation; and, therefore, the profession of empiricism came to be synonymous with vulgar ignorance. The empirics were a regular sect of ancient physicians in the time of Celsus and Galen, who give us some insight into their modes of thought and practice. They laid great stress on the unprejudiced observation of nature; and thought that, by a careful collection of observed facts forming a history, the coincidence of many observations would lead to unalterable prescriptions for certain cases. The later adherents of the school excluded all theoretical study, even that of anatomy, and were guided solely by tradition and their individual experience. By an E. in medicine is now understood a man who, from want of theoretic knowledge, prescribes remedies by guess according to the name of the disease or to individual symptoms, without thinking of the constitution of the patient or other modifying circumstances. What are called *specifics* are administered on this principle, or want of principle.

EMPIR'ICAL FORMULA, in chemistry, is the mode of expressing the constituents of a compound in symbols, where the total quantity of each element is written down without reference to any particular order or state of combination. Thus, alcohol consists of 4 equivalents of carbon, 6 of hydrogen, and 2 of oxygen; and its E. F. is $C_4H_6O_2$. When regarded, however, as a member of a family group, the constituents are arranged in a more systematic manner, as in C_4H_5O,HO, representing the theoretical constitution of alcohol, which, strictly speaking, is the hydrated oxide of ethyl. Again, the rational formula of Epsom salts, which is $MgOSO_3+7HO$, represents it theoretically as a hydrated sulphate of magnesia; while the E. F. MgH_7SO_{11} merely tells us that it consists of 1 equivalent of magnesium (Mg), 1 of sulphur (S), 7 equivalents of hydrogen, and 11 of oxygen. (Old notation.)

EMPIRICAL LAWS are such as express relationships, which may be merely accidental, observed to subsist among phenomena, but which do not suggest or imply the explanation or cause of the production of the phenomena. They are usually tentative, and form stages in the progress of discovery of causal laws. Bode's law of the distances of the planets from the sun may be accepted as an example of an empirical law.

EM'POLI, a t. of Italy, is situated in the province of Florence, in a remarkably beautiful and fertile district on the left bank of the Arno, 16 m. w.s.w. of Florence. It is a thriving town, is surrounded by walls flanked with towers, and although its streets are narrow, it is on the whole well built, and has some good squares. The most interesting building is the Collegiate church, built in 1093, the fine original façade of which has suffered but little from modern *improvements*, although the other portions of the building were considerably altered in 1738. This church contains several good paintings, and has also some excellent specimens of sculpture, among which is one by Donatello. E. has several manufactories of cotton, leather, straw-hats, and glass, a considerable trade in agricultural produce, and a weekly market of some importance. Pop. 6,500.

EMPO'RIUM (Gr. *emporion*, trading-place). The word is derived from *emporos*, which signified in Homer's time a person who sailed in a ship belonging to another, but latterly meant a wholesale merchant, as opposed to a retailer, who was called *kapēlos*. An E. thus came to be applied to the receptacles in which wholesale merchants stowed their goods in seaports and elsewhere, and thus corresponded to our warehouses, as opposed to a shop.

EMP'TION. See SALE OF GOODS.

EMPYE'MA (Gr.), an internal suppuration, a word now applied exclusively to a collection of pus in the pleura, causing pressure of the lung, and often attended by hectic fever. See PLEURISY.

EMPYREU'MA (Gr. *empyreuo*, I kindle), the burned smell and acrid taste which result when vegetable or animal substances are decomposed by a strong heat. The cause of the smell and taste resides in an oil called *empyreumatic*, which does not exist naturally in the substance, but is formed by its decomposition.

EMS, a river in the n.w. of Germany, rises in Westphalia, at the southern base of the Teutoburger Wald, and flowing first in a north-western, and then through the Hanoverian territories in a northern direction, empties itself into Dollart bay, an estuary of the German ocean, after a course of 250 miles. Its chief affluents are the Aa, the Haase, and the Leda. It is navigable for vessels of 100 tons as high as Pappenburg, which is 25 m. up the river from Dollart bay. The E. drains a basin of about 5,000 sq. m. in extent. In 1818, it was connected by a canal with the Lippe, and thus with the Rhine, which greatly increased its importance with respect to commerce and navigation.

EMS, usually called the *Baths of Ems*, to distinguish it from other places of the same name, a bathing-place known to the Romans, and celebrated in Germany as early as the 14th century. It is situated about 4 m. from Coblenz, near the most picturesque parts of the Rhine, in a beautiful valley in the province of Hessen-Nassau, traversed by the navigable river Lahn, and surrounded by wooded hills. Pop. '75, 6,104. Its warm mineral springs belong to the class containing soda; the only essential difference between the numerous springs is in the temperature varying from 24° to 46° Reaumur, and in the greater or lesser amount of carbonic acid gas contained in them. The bathing establishments are comfortably and luxuriously fitted up, as are also the hotels and private lodging-houses.

EMSER, HIERONYMUS, 1477–1527; a Roman Catholic theologian of Germany, distinguished as an opponent of Martin Luther. His most notable exploit was the publishing of a translation of the New Testament which he claimed as his own work, though it was really a reprint of Luther's translation with some slight alterations.

E'MU (*Dromaius*—or *dromecius*—*Novæ Hollandiæ*), a very large bird, one of the *struthionidæ* or *brevipennes*, a native of Australia, and widely diffused over the southern parts of that continent and the adjacent islands. It is by some ornithologists referred to the same genus with the cassowary, but the differences are very considerable; the bill being horizontally depressed, whilst that of the cassowary is laterally compressed, the head feathered, and destitute of bony crest; the throat is nearly naked, and has no pendent wattles; the feet are three-toed as in the cassowary, but the claws are nearly of equal length. The name E. or emeu was given by the older voyagers and naturalists to the cassowary, but is now the invariable designation of the Australian bird. The E. is even taller than the cassowary, which it resembles in the general character of its plumage. Its wings are mere rudiments hidden beneath the feathers of the body. Its color is a dull brown, mottled with dingy gray; the young are striped with black. When assailed, it strikes backwards and obliquely with its feet, like the cassowary, and it is so powerful that a stroke of its foot is said to be sufficient to break a man's leg. Dogs employed in hunting it are often injured by its kicks, but well-trained dogs run in before it, and spring at its neck. It cannot fly, but runs very fleetly. It is timid and peaceful, and trusts altogether to its speed for safety, unless hard pressed. In a wild state, it sometimes occurs in small flocks; but it has now become rare in and around all the settled parts of Australia. The extinction of the species may, however, perhaps be prevented by its being preserved in a state of domestication; as its flesh is excellent, and it is very easily domesticated, and breeds readily in that state. It has frequently bred in Britain. The eggs are six or seven in number, dark green; the male performs the principal part of the incubation. The eggs are highly esteemed as food. The skin of the E. contains much oil—six or seven quarts are obtained from a single bird, and on this account it has been much hunted in Australia. The food of the E. consists chiefly of roots, fruits, and herbage. Its only note is a drumming sound, which it frequently emits.

EMUL'SINE, or SYNAPTASE, is a peculiar ferment present in the bitter and sweet almond, and which forms a constituent of all almond emulsions. When bitter almonds are bruised, and water added, the E. acts as a ferment on the amygdalin, and decomposes the latter into volatile oil of bitter almonds, prussic acid, grape-sugar, formic acid, and water (see ALMONDS, VOLATILE OIL, or ESSENTIAL OIL OF). The vegetable albumen of almonds is almost entirely composed of E.; which, when separated, is a white substance, soluble in water, and is distinguished by its remarkable power of

causing the fermentation of amygdalin. It consists of carbon, hydrogen, nitrogen, and oxygen.

EMULSION is the term applied to those preparations in pharmacy obtained by triturating certain substances with water, and where the product is a milky white opaque mixture of a gummy consistence, and composed more or less of oily particles floating in mechanical suspension in the mucilaginous liquid. The *true* and *oily* emulsions are those containing true oil, as the E. of bitter almonds, obtained by bruising the latter in a mortar with water; and the *false*, or *not oily*, where no true oil is suspended, as where camphor, balsams, or resins are rubbed up with yelk of egg, mucilage, or dilute spirit of wine.

E'MYS, a genus of marsh tortoises, from which the whole family of marsh tortoises is sometimes called *emydæ*. The chelonians of this family are numerous, and widely diffused throughout the warmer parts of the world. They differ more in their habits than in their appearance and structural characters from land tortoises. Their carapace, however, is more flattened, and their feet are more expanded and webbed, so that they swim with great facility. They feed chiefly on animal food, as insects and mollusks, aquatic reptiles, and fishes, some of them even preying upon birds and mammalia which come within their reach. Two or three species of *emydæ* are natives of the s. of Europe; but two species are particularly abundant in North America, the painted tortoise (*emys picta*), and the alligator tortoise (*emysaura serpentina*). The flesh of some, as *cistudo Europœa*, is esteemed for food. This small species, about 10 in. long, an inhabitant of lakes, marshes, and muddy places in the s. and e. of Europe, is sometimes kept in ponds, and fattened for the table on lettuce-leaves, bread, etc.

ENALIOSAU'RIANS (Gr. marine lizard), an order of fossil marine saurians commencing in the carboniferous, and ending in the cretaceous periods, being most abundant in the jurassic. They have biconcave vertebræ, like those of fishes, teeth like those of crocodiles, a lizard body, and the paddles of cetaceans instead of true feet, an apparently incompatible combination. Some had long snake-like necks, and most of them were of great size, and must have been exceedingly voracious. They comprise two groups, the ichthyosaurians and simosaurians. The ichthyosaurians belong to the jurassic and cretaceous formations, while the simosaurians have been found only in the triassic. The two principal genera of the ichthyosaurians are the ichthyosaurus and the plesiosaurus, and they are the most generally known. See ICHTHYOSAURUS and PLESIOSAURUS, *ante*.

ENAMEL (Fr. *émail*, originally *esmail*, from the same root as *smelt*), the name given to vitrified substances of various composition applied to the surface of metals. Enameling is practiced (1) for purposes of utility, as in making the dial-plates of watches and clocks, coating the insides of culinary vessels, etc., when it may be considered as belonging to the useful arts; and also (2) for producing objects of ornament and beauty—artistic designs, figures, portraits, etc., when it belongs to the fine arts. Both the composition of enamels and the processes of applying them are intricate subjects, besides being in many cases kept secret by the inventors; and we can only afford space for the most general indications of their nature. The basis of all enamels is an easily fusible colorless silicate or glass, to which the desired color and the desired degree of opaqueness are imparted by mixtures of metallic oxides. The molten mass, after cooling, is reduced to a fine powder, and washed, and the moist paste is then usually spread with a spatula upon the surface of the metal; the whole is then exposed in a surface (*fired*, as it is called) till the E. is melted, when it adheres firmly to the metal. The metal most commonly used as a ground for E. is copper; but for the finest kinds of enamel-work gold and silver are also used.

Artistic or Ornamental Enameling.—This art is of great antiquity: it is proved by the remains found in Egypt to have been practiced there; from the Egyptians it passed to the Greeks, and it was extensively employed in decoration by the Romans; in the reign of Augustus, the Roman architects began to make use of colored glass in their mosaic decorations; various Roman antiquities, ornamented with E., have been dug up in Britain, and it was adopted there by the Saxons and Normans. A jewel found at Athelney, in Somersetshire, and now preserved in the Ashmolean museum at Oxford, is proved by the inscription on it to have been made by order of Alfred; and there are various figures with draperies partly composed of colored E. on the sides of the gold cup given by king John to the corporation of Lynn, in Norfolk.

Enameling has been practiced from a remote period in the east, Persia, India, and China, under a separate and distinct development; but there is nothing from which it can be inferred that the various methods were in use earlier than in Europe. As a decoration, enameling was more popular, and attained to greater perfection in the middle ages than in classic times. It was extensively practiced at Byzantium from the 4th until the 11th c., and afterwards in Italy in the Rhenish provinces, and at Limoges in the s. of France, where it was successfully followed out till a comparatively late period, in several different styles. The Byzantine and other early styles of enamel-work down to the 17th c. were generally employed in ornamenting objects connected with the service of the church, such as reliquaries, pyxes, church-candlesticks, crosiers, portable altars, the frontals of altars, etc.; the art was also greatly used in ornamenting jewelry, and

vessels made for use or display in the mansions of the rich, such as salt-cellars, coffers, ewers, plateaux, candlesticks, etc. After this period the art declined, until a new phase of it was invented in France, in which E. is used as a ground, and the figures are painted with vitrified colors on the surface of it. This is enamel-painting properly so-called, the earlier styles being more of the nature of mosaics.

Distinguished with reference to the manner of execution, enamel-work may be divided into four kinds: 1. *Cloisonée*, or inclosed, the method of the Byzantine school, in which the design is formed in a kind of metal case, generally gold or copper, and the several colors are separated by very delicate filagree gold bands, to prevent them running into each other. 2. *Champ Levé*, practiced by the early Limoges school. In this process the ornamental design, or the figures that were to be filled in with color, were cut in the metal (generally copper) to some depth; and wherever two colors met, a thin partition of the metal was left, to prevent the colors running into each other by fusion when fired. 3. Translucent E., which had its origin, and was brought to great perfection in Italy, was composed of transparent E. of every variety of color, laid in thin coatings over the design, which was incised on the metal, generally silver, the figure or figures being slightly raised in low relief, and marked with the graver, so as to allow the drawing of the contours to be seen through the ground, instead of being formed by the coarse lines of the copper, as in the early Limoges enamels. 4. Surface-painted enamels, which may be divided into two stages. The first stage, which is known as the *late Limoge* style, sprang up under Francis I. of France (1515–47). In this the practice was to cover the metal plate with a coating of dark E. for shadows, and to paint on this with white, sometimes set off with gold hatchings, sometimes having the hands and other parts of the figures completely colored. The designs were generally taken from well-known paintings or engravings of the period; and the style of the designs was strongly influenced by that of the Italian artists employed by Francis I. This style soon degenerated, and gave place to the latest or *miniature* style, which was invented before the middle of the 16th c. by Jean Toutin, a goldsmith at Chateaudun, and carried to the highest perfection by Jean Petitot, a miniature-painaer, who was born at Geneva, 1607, and afterwards resided long in England, and then in Paris. In this the plate is covered with a white opaque E., and the colors are laid on this with a hair-pencil, and fixed by firing. The paints are prepared by grinding up colored enamels with some kind of liquid, and when fused by the heat, they become incorporated with the E. of the ground. The earlier enamelers of this school occupied themselves with miniatures, snuff-boxes, and other trinkets, till the period of the French revolution, when the art fell into disuse. It was, however, revived in England early in this century; and copies of portraits and pictures on a much larger scale than the French miniatures were executed with much success by the late H. Bone, R.A., and the late Charles Muss. Works of this description possess the obvious advantage of durability; but those various qualities of texture, and the delicacy of color for which good works in oil or water-color are prized, cannot be attained in E. copies; and it is to be regretted that greater efforts are not made to turn enameling to account in the way of ornamentation, for which it is so admirably fitted, rather than in attempts at imitating works classed strictly as within the bounds of fine art, and to put in practice the older styles of enameling, particularly those denominated *champ levé* and transparent enameling.

Enameled-ware.—The liability of iron to oxidation by heat or moisture, and to corrosion even by the weakest acids, has led to many attempts to coat it with a protecting surface. Ordinary tin plate is the oldest and most familiar example of a partially successful method. Since the beginning of the present century, many attempts have been made to cover iron with a vitreous surface, and several patents have been taken for such methods of enameling. The chief difficulty in applying enamels to iron arises from the tendency of the metal to oxidize before it reaches the temperature at which the E. fuses, and to become brittle from the oxide combining with the silica of the enamel. This action being superficial, the mischief is the greater in proportion to the thinness of the iron. Therefore it is much easier to E. thick cast-iron vessels than thin vessels made of sheet-iron. A glass may be made by combining either silicic acid or boracic acid with a base; the latter fuses at a lower temperature than the former, but the glass is much dearer and not so durable as the silica glass. The enamels used for coating iron consist of a mixture of silica and borax, with various basic substances, such as soda, oxide of tin, alumina, oxide of lead, etc.

The best E. for such purposes with which we are acquainted, is that patented by C. H. Paris, and applied by Messrs. Griffiths and Browett of Birmingham. It consists of 130 parts of flint-glass powdered, 20½ parts of carbonate of soda, 12 of boracic acid. These are fused together to form a glass, then reduced to a very fine powder; the article to which they are to be applied is carefully cleaned with acid, then brushed over with gum water, and the powder dusted upon it. The gum water is merely to cause adhesion. This coating is then carefully dried, and heated just to the point at which the powdered glass will fuse, and by running together, coat the surface. The E. is generally put on in two separate layers or coatings, the first being dull gray, and the second or outer one of some brighter color. For sheet-iron hollow-ware, the latter is usually white, upon which a pattern is often printed with transfer paper by the process in use for earthenware (see POTTERY). These light enameled iron vessels, from their being practically

indestructible (except when used for cooking), are made in large numbers for use on board ships, and for colonial markets. A great variety of articles, many of them beautifully decorated in colors, such as grate-fronts, cloak-dials, panels of different kinds, tablets, and name-plates, are now executed in enameled iron at a comparatively moderate cost. It is also applied to corrugated roofing. Clarke's and other patent enamels have been successfully applied to saucepans, small cisterns, pipes, and other articles of *cast iron*. See HOLLOW-WARE.

The action of sudden heat is to expand the metal more than the E., and cause the latter to peel off. Acids find their way through minute invisible pores, which exist in the best E.; and when once they reach the iron, they rapidly spread between it and the E., and undermine and strip it off. This kind of action is curiously shown by filling an enameled vessel with a solution of sulphate of copper. The acid attacks the iron wherever pores exist, and little beads of metallic copper are deposited at all such spots; these beads go on growing until they are large enough to be very plainly seen. This is the severest test for trying the continuity of enameled surfaces, to which they can be subjected, as sulphate of copper will penetrate the glaze and body of ordinary earthenware.

ENAMEL OF TEETH. See TEETH.

ENA'RA, or ENA'RÉ, a lake of Russia in the extreme n. of Finland, is situated in lat. 68° 30′ to 69° 10′ n., and long. 27° 30′ to 28° 45′ east. It has an area of 1200 sq.m., and has numerous islands. Its superfluous waters are discharged into the Arctic ocean.

ENAR'ËA, a country of Africa, s. of Abyssinia, is situated within lat. 7° to 9° n., and long. 36° to 38° e., but its limits have not yet been definitely ascertained. It is inhabited by a portion of the Gallas tribes, who, owing to the continued communication which they keep up with Abyssinia, and also to the residence of many Mohammedan merchants among them, are much more civilized than the Gallas usually are. Their government is a hereditary and absolute monarchy. The principal rivers of E. are the Gibbe and the Dodesa. Its coffee-plantations are so extensive as to deserve the name of woods; they occur chiefly along the banks of the Gibbe. E. is remarkable for its manufactures of ornamented arms, and of cloths with embroidered borders. Besides these, it exports slaves, gold, ivory, civet, and skins, into Abyssinia. The king and a small portion of the population are Mohammedans, and it is said that native Christians have been found here. The capital is Saka, a place of considerable importance, near the river Gibbe.

ENARTHRO'SIS is the term used by anatomical writers to express the kind of joint (q.v.) which admits of the most extensive range of motion. From the mode of connection and the form of the bones in this articulation, it is commonly called the ball-and-socket joint. It occurs in the hip and shoulder joints.

ENCAMPMENT (Lat. *campus*, a plain) is a lodgment or home for soldiers in the field. There are *intrenched* camps, where an army is intended to be kept some time, protected against the enemy; *flying* camps, for brief occupation; camps of *position*, bearing relation to the strategy of the commander; and camps of *instruction*, to habituate the troops to the duties and fatigues of war.

Under CAMP has been given an account of the manner in which Roman camps were constructed. It is probable that the same general plan was adhered to until the invention of gunpowder. When cannon came to be used, however, a new arrangement of camp became necessary, to shield the army from long-range projectiles. Everything, indeed, relating to attack and defense, especially to the latter, is taken into account in chosing the locality of a camp. A healthy site, good water, security from floods, and plenty of fuel and forage, are the chief requisites in a good encampment.

The British army, when in the field, usually encamps by brigades or divisions, roads and paths being arranged before the troops arrive. The infantry, cavalry, and artillery are so placed as to defend each other in the event of a sudden attack. There is a chain of guards all round the spot; and the park of artillery is placed behind the troops. The sutlers and servants are in the rear of the camp, but not beyond the limits of the rear-guard. The tents of the infantry are ranged in rows perpendicular to the front, each row containing the tents (q.v.) for one company. The circular tents, now much used, accommodate 15 men each. The cavalry are in like manner encamped in rows; but each circular tent accommodates only twelve men. There are streets or roads between the rows of tents, of regulated width; and the officers' tents are at a given distance behind those of the men: the subalterns' tents being nearest to those of the companies to which they respectively belong. As a general rule, the line of the whole E. is made to correspond as nearly as practicable with that in which the troops are intended to engage the enemy when fighting is renewed; to which end the tents of each battalion are not allowed to occupy a greater space in front than the battalion itself would cover when in order of battle.

Under most circumstances, in modern warfare, an E. is not defended by artificial constructions; the commander seeks security for his troops in streams, marshes, difficult surface of country, and numerous advanced posts. Sometimes, however, more extensive defense-works are necessary; and then we have an example of an *intrenched*

camp, which becomes a fortified inclosure. The chief uses of such a camp are—to secure an army while covering a siege, or in winter quarters, to accommodate a corps of observation while the active army is engaged elsewhere; or to defend a position near a fortified place. Care is taken that the site is not commanded by neighboring hills. All villages are occupied, and all obstacles removed, within a distance of half a mile or a mile. The area of ground selected is large enough to contain the necessary store of arms, ammunition, food, fuel, forage, and water, and to enable the troops to maneuver. The junction of two rivers is often selected as a favorable spot. Various defense-works are constructed around or near the spot, such as continuous earth-works, redoubts, flèches, etc. The position held by the allies outside Sebastopol, during the long intervals when the cannonading was suspended, had many of the characteristics of an intrenched camp.

Camps of *instruction* may be either temporary or permanent. Of the former kind was the camp formed at Chobham in Surrey in 1853, merely for the summer months, to exercise certain regiments in evolutions. Another was formed at Shorncliffe in Kent in 1855, at first to receive troops of the foreign legion; but it has since been improved to the condition of a permanent camp. The great establishment at Aldershott is described under ALDERSHOTT CAMP. Since that article was originally written, this remarkably popular camp has been, by an ungrudging outlay of public funds, improved in all particulars, and the small agricultural village of Aldershott has grown into an important commercial town, with railway stations, hotels, market-house, handsome shops, etc. A large permanent camp has also been established in Ireland, on a plain called the Curragh of Kildare, and there is a smaller one at Colchester.

ENCAUSTIC PAINTING (Gr. *encaustikē*, infired, or fixed by fire), a manner of painting practiced by the ancients. As the name implied that fire was used in the execution, some have been led to suppose that E. P. was the same as enamel painting; but notices by Pliny and other writers show clearly that it was a species of painting in which the chief ingredient used for uniting and fixing the colors was wax dissolved by heat. Various attempts have been made in modern times to revive it. About the middle of last century, count Caylus and M. Bachelier, and in 1792, Miss Greenland, made various experiments with this view. The count laid the result of his experiments before the academies of painting and of sciences in Paris; and the ingenious lady was rewarded with a gold pallet by the society for the encouragement of arts in London; but the success of these efforts seems to have been but temporary. E. P. was, however, some years ago again taken up in Germany under the patronage of the late king of Bavaria, who had a number of important works executed in this way. The colors are ground, and laid on with a vehicle composed principally of wax. Miss Greenland dissolved gum-arabic in water, afterwards adding gum-mastic, which was dissolved by stirring and boiling, and when the mixture had reached the boiling-point, she put in the wax. After painting the picture, she passed a thin coating of melted wax over it with a hard brush, and then drew over the surface an iron—for ironing linen—moderately heated. After the picture cooled, it was rubbed with a fine linen cloth. The German method is somewhat similar, but some other ingredients are used; among these, potash with the wax; and in place of an iron being passed over the surface, the wax is brought to the surface by a vessel containing fire being held at a little distance from the picture. E. P. is not likely to come into general use, for neither in imparting brilliancy to the colors, facility for execution, nor durability, is it to be compared with oil-painting.

ENCAUSTIC TILES, ornamental tiles made of earthenware, and now extensively used for paving churches, halls, conservatories, etc. Strictly speaking, the name applies only to tiles with a pattern produced by layers of different-colored clays; but we may also include those made of a single color where two or more kinds go to form a pattern. Of course a mosaic can thus be formed with tiles of various forms as well as colors. Tiles of one color are made of dried slip—that is, the powder of carefully mixed and prepared clay. These "dry tiles" are made by placing the colored clay powder in strong steel molds, and subjecting it to a pressure of several hundred tons, by means of a plunger fitting accurately into the mold. A depth of 3 in. of powder is compressed into a tile of 1 in. in thickness. It is then removed, heated in a hot chamber, fired, and glazed if required.

The figured tiles are made in a different manner. The clay is worked in a moist state, but very stiff, first into square blocks. These are cut into square slices or slabs by passing a wire through them; upon this is put a facing of fine clay of the color of the ground of the pattern—another layer, of a different quality of clay, is sometimes added to the bottom, to prevent warping. It is then placed in a mold, with a plaster-of-Paris slab forming the top, on the under surface of which is the pattern in relief. This slab is pressed down, and thus forms a deep impression of the pattern which is to be produced in another color. The clay of the requisite color to form the pattern is now poured, in a semi-fluid state, into this depression, and allowed to flow over the whole face of the tile; then it is set aside until dry enough to have its surface scraped and smoothed on a whirling table. By this means the superfluous clay is removed, and the pattern is

brought out clear and well-defined, the two colors of clay forming one smooth flat surface. The tile is then dried and fired.

By Malkin's patent process, inlaid as well as plain tiles are now wholly made of dried slip. The pattern is produced by the use of brass plates one eighth of an inch thick, a separate one being used for each color. Thus, if it consist of an ornament in red and white on a blue ground, one plate is perforated so as to enable the red portion of the clay powder to be filled in, another is cut for the white portion, and a third for the blue ground. When all are filled up, the tile is pressed in a screw-press and fired.

Tiles of this kind were used for paving churches in England and on the continent from the 12th to the 15th c., after which they fell into disuse. The modern manufacture is therefore nothing more than a revival, with some improvements, of an ancient art.

ENCEINTE (Fr.), in fortification, denotes generally the whole area of a fortified place. Properly, however, it means a cincture or girdle, and in this sense the *enceinte* signifies the principal wall or rampart encircling the place, comprising the curtain and bastions, and having the main ditch immediately outside it.

ENCEPH'ALOCELE (derived from the Gr. *encephalon*, the brain, and *kele*, a tumor), is the term applied to a tumor projecting through the skull, in one of the parts where the bones are incomplete in infancy, and consisting of a protusion of the membranes of the brain, containing a portion of brain itself. The most common situation of such tumors is in the middle line and at the back of the head. Surgical interference is scarcely ever justifiable, and all that can usually be done is to give uniform support to the tumor, and to defend it from injury.

ENCHON'DROMA is the term employed in pathological anatomy to signify an abnormal cartilaginous growth. These growths most commonly occur in connection with the bones, and they are not unfrequent in some of the glandular structures. See TUMORS.

ENCHO'RIAL CHARACTERS. See HIEROGLYPHICS.

ENCINA, or ENZINA, JUAN DEL, 1468–1534; the father of the Spanish drama, educated at Salamanca. About the close of the century he began to exhibit dramas of his own construction, in which he sometimes played low comedy parts. Early in the 16th c. he went to Rome and joined the priesthood. He visited Jerusalem, and published an account of his journey. His dramatic works mark the transition from the purely religious to the secular stage.

ENCKÉ, JOH. FRANZ, the well-known astronomer, was b. Sept. 23, 1791, at Hamburg, where his father was a clergyman. After studying at Göttingen, he served, during the campaign of 1813–14, in the artillery of the Hanseatic legion, and in 1815, in the Prussian army, as lieut. of artillery. On the establishment of peace, he left the service, and became assistant, and afterwards principal astronomer in the observatory of Seeberg, near Gotha. In 1825, chiefly at the instigation of Bessel, he was called to Berlin as successor to Tralles, in the secretaryship of the academy of sciences, and as director of the observatory. While at Gotha, the astronomical prize offered by Cotta was awarded to E. by the judges Gauss and Olbers, for his determination of the orbit of the comet of 1680. This led him to solve another problem, which had been proposed along with the other—viz., the distance of the sun. The solution, by means of the two transits of Venus in 1761 and 1769, is published in two separate tracts (*Die Entfernung der Sonne*, Gotha, 1822–24). In 1819, he proved that the comet discovered by Pons, Nov. 26, 1818, revolved in the hitherto incredibly short period of about 1200 days, and had been already observed in 1786, 1795, and 1805. It has since gone by the name of E.'s comet, and has appeared regularly; the period of its recurrence being 3.29 years, or about $3\frac{3}{10}$ years. See COMETS. E.'s researches on this subject are contained in the *Transactions of the Berlin Academy*. In 1830, he undertook to edit the Berlin *Astronomical Almanac*, in which he published a number of astronomical treatises. Three volumes have appeared of *Astronomical Observations at the Berlin Observatory*, begun in 1855. He died 2d Sept., 1865.

ENCORE ("Again"), a French expression, generally used in England by the audience of a theater or concert-room, when requesting the repetition of the performance of a piece of music. It is not used by the French themselves, who, in similar circumstances, exclaim *bis* (twice).

EN'CRATITES, the name of early ascetics in the Christian church, who forbade marriage, the eating of the flesh of animals, and the use of wine, going so far as to substitute water for wine in the eucharist.

ENCRI'NAL or ENCRIN'ITAL **LIMESTONE**, a name given to some carboniferous limestones, from the great abundance in them of the calcareous skeletons of encrinites (q.v.), whole masses of the rock being almost entirely composed of them.

ENCRI'NAL or ENCRINITAL LIMESTONE, a limestone largely composed of the remains of crinoids. There are large beds in the Hamilton and Helderberg groups in New York state.

EN'CRINITES, a name applied generally to the fossil crinoidea, a family of echinodermata (q.v.). The popular name, *stone lilies*, is given to the numerous fossil species,

from the resemblance which many of them present when the rays are closed to the lily. Hence also the name crinoidea. Crinoids are characterized by having their bodies supported, during the whole or part of their existence, on a longer or shorter jointed calcareous stem. The stem is attached either by the expanded base, or by jointed processes, to the rocky bed of the sea, or perhaps, in some cases, to floating bodies, like barnacles. Occasionally, numerous root-like side-arms are sent out from the base of the stem to strengthen and support it; and in some species, as in the recent *pentacrinus*, the column throughout its length is furnished with axillary side-arms. The stem is round or five-sided; in one genus only is it elliptical. It is composed of a number of joints, perforated in the center, for the passage of a soft portion of the animal, and beautifully sculptured on the articulating surfaces. The body is cup-shaped, and composed of many-sided plates on the under surface, to the center of which the stalk is attached, while the upper surface is covered with a coriaceous skin, protected by many small plates. On this was situated the mouth, which was frequently proboscidiform, and near it was the anal orifice—the alimentary canal being turned upon itself, as in the bryozoa. The arms spring from the edges of the cup. They are five in number at their origin, but, with few exceptions, speedily divide and subdivide dichotomously. The arms are composed of articulated calcareous joints, similar to those of the stems. Each joint is furnished with two slender-jointed appendages or cirri, of use to the animal in capturing its prey, which consisted of mollusca and other small animals. The number of joints in some species is truly amazing. Dr. Buckland calculated that *pentacrinus briareus* consists of at least 150,000; and "as each joint," according to Carpenter, "was furnished with at least two bundles of muscular fiber—one for its extension, the other for its contraction—we have 300,000 such in the body of a single *pentacrinus*, an amount of muscular apparatus far exceeding anything that has elsewhere been observed in the animal kingdom."

E. are represented in the British seas by one species, *comatula rosacea*, which in its perfect state is free, and moves about in the same manner as other star-fishes, but is in its structure a true crinoid, and, in fact, when young, has the flexible stalk characteristic of the order. It is doubtful whether more than one species (*pentacrinus caput medusæ*) of permanently stalked E. lives in modern seas. It is a native of the West Indian seas.

The family commenced its existence with the earliest sedimentary deposits. Seventy-three genera have been described, containing upwards of 300 species, two thirds of which are found only in paleozoic rocks. The most ancient E. have nearly all round stems, the few that are five-sided having the articulated surface of the joints simply radiated, and not complexly sculptured as in pentacrinus, the type of a division of the order which appears first in the lias. The earlier seas literally swarmed with these animals. "We may judge," says Dr. Buckland, "of the degree to which the individual crinoids multiplied among the first inhabitants of the sea, from the countless myriads of their petrified remains which fill so many limestone beds of the older formations, and compose vast strata of entrochal marble, extending over large tracts of country in Northern Europe and North America. The substance of this marble is often almost entirely made up of the petrified bones of encrinites, as a corn-rick is composed of straws." See CRINOIDEÆ and PENTACRINUS.

ENCUMBERED ESTATES COURTS. See INCUMBERED ESTATES COURTS.

ENCUMBRANCE. See INCUMBRANCES, *ante*.

ENCYCLOPÆ'DIA means properly a book or work professing to give information, more or less full, on the whole circle of human knowledge. The name is compounded of two Greek words, *enkyklios*, circular or general; and *paideia*, discipline or instruction. These words were used by the Greeks and Romans to signify the circle of instruction through which every free-born youth had to pass before entering on public life. That circle embraced more particularly grammar, music, geometry, astronomy, and gymnastics, and afterwards became the "seven liberal arts" of the middle ages. The compound name E. appears to have been unknown to the Greeks, and also to the Latin writers of the classic period; and there is no evidence that either Greeks or Romans ever applied the words, single or compounded, to designate a book. The short form *Cyclopædia* has still less classical authority than encyclopædia.

Encyclopædias, in the modern sense of the word, are most commonly alphabetical; but sometimes the arrangement is "rational," i.e., according to the natural relations of the subjects. An alphabetical E. is a dictionary of universal knowledge. Besides this, its proper meaning, of a repertory of universal knowledge, the name E. is often applied —less properly perhaps—to alphabetical works whose scope is limited to a particular branch—works differing in no respect from others which are styled dictionaries, gazetteers, etc. See DICTIONARY. As all works of this kind, which now form a large and increasing section of literature in every language, have in so far a common character with encyclopædias proper, we may give some account of the whole class under the present head.

For the sake of convenience, they may be arranged in three divisions: 1. The earlier works of this kind, having, for the most part, merely an encyclopædic character, i.e., embracing a large range of subjects, without distinctly aiming at universality; 2. Ency-

clopædias proper, which treat of the whole circle of human knowledge; 3. Books professedly confined to a definite department of knowledge, whether under the name of E., dictionary, gazetteer, or other title. As books of this class profess to touch on every important point that comes within their scope, they may be considered as encyclopædic in a limited sense. In the following sketch, the distinction between the first and second of those classes, which is of a somewhat indeterminate kind, is not strictly adhered to when it would interfere with the chronological sequence.

1. The earliest work of an encyclopædic character is generally ascribed to Speusippus, a disciple of Plato. The great collections of Varro (*Rerum Humanarum et Divinarum Antiquitates* and *Disciplinarum libri* ix.), of the elder Pliny (*Historia Naturalis*), of Stobæus, of Suidas, of Isidorus (the *Origines*), and of Capella, belong to the same class, but they exhibit no plan, and are only confused accumulations of the then known arts and sciences. Vincent of Beauvais (1264) surpassed them all. He gathered together with wonderful diligence the entire knowledge of the middle ages in three comprehensive works, *Speculum Historiale, Speculum Naturale*, and *Speculum Doctrinale*, to which soon after an unknown hand added a *Speculum Morale*. But these, as well as the other similar compilations which appeared in the later mediæval period under the title of *Summa*, or *Speculum* (mirror), are marked throughout by a lack of philosophic spirit. Perhaps the nearest approach to the modern E. by an ancient writer, dates two centuries earlier than the time of Beauvais. In the 10th c., flourished Alfarabius, the ornament of the school of Bagdad, who wrote an encyclopædic collection of knowledge, remarkable for its grasp and completeness, and which still lies in MS. in the Escorial of Spain. Among the earliest and most noted of the modern encyclopædias was that of Johann Heinrich Alsted, or Alstedius, which appeared in Germany in two volumes in 1630. It consisted of 35 books in all, of which the first four contained an explanation of the nature of the rest. Then followed six on philology, ten on speculative and four on practical philosophy; three on theology, jurisprudence, and medicine; three on the mechanical arts; and five on history, chronology, and miscellaneous topics. Two important French works belong to this century—the one is Louis Moreri's *Grand Dictionnaire Historique et Critique*, of which the first edition appeared at Paris in 1673, and the last in 1759; the other, Peter Bayle's famous *Dictionnaire Historique et Critique*, published at Rotterdam, in 4 vols., 1697. The first encyclopædic *dictionary*, so far as known, appeared in Germany as the *Lexicon Universale* of Hoffmann (2 vols., Basel) in 1677. Some time after there appeared in France, Thomas Corneille's *Dictionnaire des Arts et des Sciences*, 2 vols. (Paris, 1694). Dictionaries limited to the explanation of technical terms had long been common throughout Europe; but previous to Hoffmann's work, no attempt had been made to bring the whole body of science and art under the lexicographic form. A highly successful attempt identical in kind, and attributable in idea, it may be, to the German work just alluded to, was the *Lexicon Technicum* of Dr. Harris, 2 vols. folio (London, 1710), which may fairly be regarded as the parent of all the dictionaries of arts and sciences that have since appeared in England. The *Cyclopædia* of Ephraim Chambers, published in 1728, in two very large folio volumes, presents the next marked advance in the construction of encyclopædical dictionaries. This one was brought out with considerable claims to originality of arrangement. The author endeavored to communicate to his alphabetical materials something of the interest of a "continuous discourse," by an elaborate system of cross references. Another peculiarity of this cyclopædia was that its author, in the details of mathematical and physical science, gave only conclusions and not processes of demonstration. It was long a very popular work. The largest and most comprehensive of the successors to Hoffmann's book in Germany, was Zedler's *Universal Lexicon*, 64 vols. (Leip. 1732–50). In point of comprehensiveness, this work should be classed with the encyclopædias proper, there being almost nothing then known that may not be found in it. Perhaps the strongest impulse, if not in all respects the best, communicated by this successful attempt of Ephraim Chambers, was given to the French mind through D'Alembert and Diderot. Their *Encyclopédie* was really, though not professedly, founded upon E. Chambers's book, which an Englishman named Mills had translated between 1743 and 1745, though the French version of it never was published. The great French *Encyclopédie* was written by various authors of high literary and philosophical attainments, but of whom nearly all were tainted too much with the most impracticable revolutionary ideas, besides holding for the most part extremely skeptical opinions. The *Encyclopédists* excluded both biography and history from its scope, yet infused into it more originality, depth, and ability, than ever had appeared before within the boards of an encyclopædical dictionary. It appeared at Paris in 28 vols. between the years 1751–72, and was followed by a supplement in 5 vols. (Amst. 1776–77), and an analytical index in 2 vols. (Paris, 1780). The work was everywhere received with the greatest enthusiasm, and it secured a place in the literary history of the nation for the editors and principal writers, who are ordinarily known as the *Encyclopédists* of France. They were D'Alembert and Diderot the editors, Rousseau, Grimm, Dumarsais, Voltaire, baron d'Holbach, and Jancourt. [See La Porte's *Esprit de l'Encyclopédie* (Paris, 1768); and Voltaire's *Questions sur l'Encyclopédie* (Paris, 1770).] D'Alembert's celebrated preliminary discourse was garbled in various pretentious works of this class published for the most part in England; such were Barrow's *New and Universal Dictionary of Arts and Sciences*, 1 vol. folio, 1751; and the *Complete Dictionary of Arts*

and Sciences, by Croker, Williams, and Clerk, 3 vols. folio, 1766. A somewhat better, though rather illogical performance was published by a "Society of Gentlemen" in 1754 in four 8vo vols., generally known as *Owen's Dictionary*, from the name of the publisher of it. The first rude outline of the ponderous and solid *Encyclopædia Britannica* was laid down in the year 1771, in three volumes, but it was nothing more than a dictionary of arts and sciences; it had not yet attained to its subsequent universality. Such is a brief outline of the earlier kind of encyclopædias.

2. The first E. proper that demands our attention is the *Encyclopædia Britannica*, of which the 2d comparatively complete edition, containing biographical and historical articles, appeared in 10 vols., between 1776 and 1783; the 3d edition was completed in 18 vols. in 1797; the 4th edition, in 20 vols., in 1810; the 5th and 6th editions, and supplements, in 6 vols., appeared between 1815–24; the 7th edition in 21 vols., in 1830–42; the 8th edition, in 21 vols., 1852–60; and a 9th edition is now in progress. The method pursued by this work, while thoroughly alphabetical, consists in a combination of the systematic and the particular. In few instances is any science broken up into fractional parts; nearly all the sciences are given in treatises as they severally occur in the order of the alphabet. In some cases, however, where obscurity might result from such a plan, the other method is adopted. A marked feature of this work, is the number of complete treatises and dissertations which it contains by men of European name. From first to last, this E. has been executed and published in Edinburgh, the literary reputation of which it has helped in no small degree to increase. The next E. that we must notice is the *Encyclopédie Méthodique par Ordre des Matières*, which was begun in 1782, and was not finished till 1832. It extends to 166½ vols. of text, with 51 "parties," containing 6,439 plates. Each subject is treated in a separate volume or series of volumes, so that the work is a collection of separate dictionaries, more extensive than any encyclopædic work that has yet appeared. A work of higher scientific value, however, and even of a more varied nature, has been in progress for nearly half a century in Germany, undertaken originally by professors Ersch and Gruber in 1818, and which has since continued to appear, in three several sections of the alphabet, up to the present time. There have already appeared of this great *Allgemeine Encyclopädie der Wissenschaften und Künste* some 150 volumes. In 1802, Dr. Abraham Rees projected an extended and improved edition of Ephraim Chambers's *Cyclopædia*, which was completed in 45 volumes in 1819. The system of cross-references peculiar to E. Chambers is very effectually carried out in this book; but besides including a great accession of historical and biographical detail, it contained a large number of papers, prepared by competent writers, on subjects with which their life had rendered them familiar. Another work of considerable merit, which began to appear in 1810, was Brewster's *Edinburgh Encyclopædia*, edited by the late sir David Brewster, and completed in 18 vols., in 1830. In 1812, a great impetus was given to encyclopædic publications, by the appearance of the *Conversations-Lexicon* of F. A. Brockhaus of Leipsic. It has since gone through twelve editions. The eleventh issue, in 15 vols., appeared between 1864 and 1868 (supplement, 1872–73). The twelfth edition began to appear in 1875. It has been translated into nearly all the civilized languages of Europe, no fewer than *four* English works of the kind being professedly founded on it: these are the *Encyclopædia Americana*, in 14 vols. (Philadelphia, 1829–46); the *New American Encyclopædia*, 16 vols. (New York, 1858–63), of which a new ed. under the title *American Cyclopædia* appeared between 1873 and 1876; the *Popular Encyclopædia*, 7 vols. (Glas., new ed. 1874); and Chambers's *Encyclopædia*, 10 vols. (Edin. 1860-68; revised ed., 1874–79). Of these, the last-mentioned is a substantially new work, following in its construction the admirable plan of the *Conversations-Lexicon*, but making use of its valuable matter only so far as it is found suitable.

The next encyclopædic work which appeared after the *Conversations-Lexicon*, was one projected according to an original philosophic plan by Samuel Taylor Coleridge, in 1818, and finished in 1845, in 30 volumes. This *Encyclopædia Metropolitana* was arranged in four divisions: 1st, the pure sciences; 2d, the mixed and applied sciences; 3d, biography and history; and 4th, miscellaneous and lexicographic articles. The contributions to the first two divisions were written by persons of recognized ability, and they have nearly all been published separately in 8vo volumes since the *Metropolitana* appeared. If the book had any fault, it was that the plan of it was too rigidly philosophical, and therefore not adapted to be consulted dictionary fashion; for although in one sense the alphabetic arrangement, by its jumble of subjects, is most heterogeneous and irrational, it recommends itself to popular acceptance by its extreme simplicity; and in point of fact, no E. has ever been thoroughly popular that has not been executed on the plan of a single alphabet, in which all subjects, however various, are included. Next appeared the *Penny Cyclopædia* of the society for the diffusion of useful knowledge, which was begun in 1833, and completed in 1843, in 28 volumes. This work was perhaps, at the time it appeared, the most useful and convenient, for the purposes of general consultation, of any encyclopædical treatise that had ever been issued. The *English Cyclopædia* is founded on the copyright of the *Penny Cyclopædia*, but is rearranged into four great divisions, which are each given in the order of the alphabet, viz., geography, natural history, biography, and arts and sciences. This publication was begun in 1853, and was completed in 1861, in 22 vols.; a synoptical index appeared in 1862, and a supplementary volume for each division has since (1869–73) been issued.

Among other publications of this character which have appeared in the course of the present century, may be mentioned Wilkes *Encyclopædia Londonensis*, in 24 vols. 4to (Lond. 1810–29); the *Encyclopædia Perthensis*, in 23 vols. (Edinburgh, 1816); and the *London Encyclopædia*, 22 vols. (Lond. 1829). The French have likewise published an *Encyclopédie des Gens du Monde*, in 22 vols. 8vo (Par. 1833–44); and *Encyclopédie Moderne*, which, with its supplement, occupies 42 vols. 8vo (Par. 1846–62); and a *Dictionnaire de la Conversation et de la Lecture*, 2d ed. in 16 vols. (Par. 1854–57), to which a supplement was afterwards added. The last of these is to a large extent based on the *Conversations-Lexicon* of Brockhaus. The most notable of the other German encyclopædies are Meyer's *Neues Conversations-Lexicon*, in 15 vols. (1857; 3d ed. 1874); and Pierer's *Universal Lexicon*, in 34 vols. (Altenburg, 1840–46), a sixth edition of which began to appear in 1875. In addition to these, there are several other continental encyclopædies, which are based upon the *Conversations-Lexicon*—such as the *Enciclopedia Española* (Madrid); the *Nuova Enciclopedia Popolare Italiana* (Turin); the *Nordisk Conversations-Lexicon*, 5 vols. (Copenhagen, 1858–63); and the *Svenskt Konversations-Lexikon*, 4 vols. (Stockholm, 1845–51); besides others in Russia, Hungary, the Netherlands, etc.

3. We have now to direct attention briefly to those books that are *dictionaries* or encyclopædias for one branch of knowledge. These works have been always very numerous, both in this country and on the continent. Such are the *Biographie Universelle* (commenced in 1811; new edition, 1842–65); Chalmers' *Biographical Dictionary*, in 32 vols. (1812–17); the *Dictionnaire des Sciences Médicales*, 60 vols. (Par. 1812–22); *Nouveau Dictionnaire d'Histoire Naturelle*, 36 vols. (Par. 1816–19); F. Cuvier's *Dictionnaire des Sciences Naturelles*, 60 vols. text, 10 vols. plates (1816–45); *Dictionnaire de l'Industrie*, etc., 10 vols. (Par. 1834–41); M'Culloch's *Commercial Dictionary* (1832; last edition, 1869); M'Culloch's *Geographical Dictionary* (1st edition, 1841; new edition, 1866); the *Dictionary of Practical Medicine* (Lond. 1866); Chambers' *Cyclopædia of English Literature* (1843; third edition, 1876); Spon's *Dictionary of Engineering* (1869–74); Johnston's *Gazetteer* (1850; new edition, 1877); Morton's *Cyclopædia of Agriculture*, 2 vols. (1855); the *Nouvelle Biographie Générale* (1855–66); Lippincott's *Gazetteer of the World* (Philadelphia, last ed. 1873); Allibone's *Dictionary of British and American Authors* (Philadelphia, 1859–71); Ure's *Dictionary of Arts, Manufactures, and Mines* (1839; 7th ed., supp. vol. 1877); Schmid's *Encyclopædia des Erziehungs und Unterrichtswesen* (1859–75). Nor must we overlook the dictionaries of Dr. William Smith, viz., the *Dictionary of Greek and Roman Biography and Mythology*, 3 vols. (1843–48; new ed. 1849–51); the *Dictionary of Greek and Roman Antiquities*, 2d ed. (1849); the *Dictionary of Greek and Roman Geography*, 2 vols. (1854–57); the *Dictionary of the Bible*, 3 vols. (1860–63); and the *Dictionary of Christian Antiquities* (vol. i. 1875). These dictionaries are the product of the ripest scholarship in Britain, and are perhaps the most splendid specimens in existence of encyclopædias devoted to special branches of knowledge. See DICTIONARY.

ENCYCLOPÉDISTS. See ENCYCLOPÆDIA.

END. This familiar word is concerned in some important discussions, and especially in ethics. It is in the sense of "the thing aimed at," the object, purpose, or goal of human action, that we have here to consider it. There is a fundamental contrast between science and art, knowledge and practice. Science, or knowledge, embraces the general order of the universe, and states that order in the form by which we can take in as much as possible in one view; it is the fullest intellectual comprehension of the phenomena of nature that the mind can attain to. Art, or practice, on the other hand, selects and appropriates certain items of knowledge, so as to subserve some useful purpose, some exigency of human life. Thus, agriculture, navigation, law, politics, education are all branches of practice; they involve knowledge, but in strict subordination to their several purposes. The navigator studies astronomy, not with a view to enlighten his understanding as to the mysteries of the solar system and the starry sphere, but with a view to the guidance of his course in the sea. In short, to an art (the word is not here used in the narrow sense of a fine art), or a department of practice, belongs in the first place the consideration of the *end*. Every art has its E., which is its distinction from every other. In most of the arts, the E. is clear and unmistakable; we all know what is expected of a builder, a soldier, or a judge; the only question is how to obtain the knowledge requisite for adequately performing each separate function. But there are some departments where the E. itself is not agreed upon, which casts a peculiar difficulty on the practice. Thus, it was remarked under CIVILIZATION, that the E. of the whole mechanism of human society, including politics, etc., is differently viewed by different minds. But it is in the one special department of morality that the consideration of the E. is of most vital consequence. This feature of the ethical problem has been very little adverted to in modern discussions, while the ancient philosophers kept it more prominently before them. Aristotle begins his *Ethics* by remarking that every art aims at some good; most arts, as medicine, ship-building, generalship, having limited or partial ends; while some comprehend much wider ends than others. The largest E. of all is the good of mankind collectively. Hence he goes on to inquire what is the highest good of man, and finds that happiness is neither pleasure, nor honor, nor virtue (by itself), nor wealth, but that it

is "an energy of the soul according to virtue;" activity, in opposition to oriental notions of luxurious repose, being an essential in his eyes. He has next, therefore, to inquire what "virtue" is, according to which a man must employ his activity—a question of no easy solution. Still, the discussion brings out the one fact, that morality is a branch of practice, but unlike most arts in this, that the E. is peculiarly difficult to determine precisely. Accordingly, it is necessary to have in connection with it a set of discussions, called by Mr. J. S. Mill (*Logic*, concluding chapter) teleology, or the doctrine of ends, corresponding to what the German metaphysicians have termed the principles of practical reason. The various theories of moral obligation differ in their statement of the E. of morality; according to one, it is the self-interest of the individual; according to another, the interest of mankind on the whole. The most prevalent theory is the harmonizing with a certain inward sentiment called the moral sense. See ETHICS.

ENDEM'IC (from *en*, among, and *dēmos*, the people), a term applied to diseases which affect numbers of persons simultaneously, but so as to show a connection with localities as well as with their inhabitants. Endemic diseases are usually spoken of as contrasted with epidemic (q.v.) and sporadic (q.v.); the first term indicating that a disease infests habitually the population within certain geographical limits, and also that it is incapable of being transferred or communicated beyond those limits; while, on the other hand, a disease is termed epidemic if it is transmitted without reference to locality; and sporadic if it occurs in isolated instances only. The theory, accordingly, of E. diseases it, that they are in some way or other connected with the soil—the result of terrestrial influences, or *miasms*—of poisons generated within the earth, or near its surface, and diffused through the air, so as to be weakened in proportion to the distance from the source of the poison. Such poisons are always observed to be more virulent in summer than in winter—more dangerous at night, when the vapors are concentrated on the surface of the soil, than in the day time—more abundant in the plains, and in close confined places, than at a certain degree of elevation—more easily carried in the direction of the wind than in the opposite—and very often arrested altogether by water, or by a belt of forest or other luxuriant vegetation. In all these particulars, *endemic* are different from *epidemic* diseases, which bear no very obvious relation to the soil, and are not observed to be considerably modified either by the prevailing winds or the period of the day or night at which exposure to their influence takes place. The most marked type of an endemic disease is ague (q.v.) or intermittent fever, which has all the habits mentioned above, and is to so marked a degree a denizen of particular tracts of country as to lead to their being in some instances almost depopulated. Many places in Italy are a prey to the *aria cattiva* or *malaria*, as it is popularly called; and hence, no doubt, even more than for protection from human foes, the custom so prevalent in that country of building the villages on the tops of hills, so as to secure immunity from the poisonous vapors raised by the solar heat from the plains lying on either side at the base of the Apennines. Terrestrial *miasms*, or such poisons as generate E. diseases, are usually found in the neighborhood of marshy flats, or of uncultivated tracts of land at the confluence of rivers, or where a *delta*, or a wide channel subject to overflow, is formed at the upper end of a lake. In proportion, too, as the heat of the sun is greater, the tendency to malarious emanations is increased; and in the tropics, accordingly, large tracts of jungle and forest are often rendered absolutely uninhabitable and almost impassable at certain seasons, by the invisible and odorless germs of intermittent, remittent, and even continued fevers (q.v.), which are more fatal and unmanageable than the most terrible epidemic pestilence to those who are exposed to them. Such diseases are almost always sudden in their mode of attack, and they indicate the range of their influence by the number of persons attacked; but they are wholly free in most cases from the suspicion of communication by contagion (q.v.), which is so frequent in the case of epidemic diseases. The precise nature of the malarious poison has never yet been discovered with any approach to exactness. It is known, however, to be almost invariably checked by drainage and cultivation of the soil; and hence many places in Europe, formerly very productive of E. diseases, have now ceased to be so, as in the case of the Tuscan Maremma, and some parts of Kent and Essex, and of the Lothians in Scotland.

EN DERBY LAND, discovered by Biscoe in 1831, lies in lat. 67° 30′ s., long. 50° east. It appeared to the discoverer to be of considerable extent, and was closely bound by field ice, but owing to stress of weather and the extreme cold, it could not be approached within 20 or 30 m., and Biscoe was thus unable to say whether the land he discovered was an island or a strip of continental coast.

ENDER'MIC AND HYPODER'MIC METHODS OF TREATMENT. These terms are, as the names imply, used to designate certain methods of making the skin an agent for the reception of medicines. The endermic method consists in raising a blister by the ordinary process, opening it by a small puncture, which must not be at the lowest part of the bladder, gently pressing out the fluid contents, and then injecting a medicinal solution, by means of a small syringe, through the puncture into the emptied sac; or, if the medicine is in the form of powder, it may be scattered over the raw surface. The endermic method is now almost entirely superseded by the hypodermic method, in

which medicines are introduced into the subcutaneous cellular tissue by means of a very finely pointed syringe. For the invention of this process, the science of medicine is indebted to Dr. Alexander Wood of Edinburgh. It is chiefly, but not solely, to anodynes that these methods are especially applicable. It has been found that morphia given by Dr. Wood's method acts more speedily and more powerfully than when given by the mouth: moreover, the medicine given in this way does not disturb the functions of the stomach, and may be administered in those cases of irritation of that organ in which medicines introduced into it would be rejected by vomiting. A solution of acetate of morphia, carefully freed from any excess of the acid, and of such strength that three minims shall contain one third of a grain, is commonly employed, the dose varying from one to three minims, or from one ninth to one third of a grain of the salt. If the general effects of the morphia (as relief of pain and sleep) are required, any convenient part of the body, as, for instance, the fore-arm, may be selected: the skin, pinched up between the fore-finger and thumb of the left hand, is penetrated by the point of the syringe, and the solution injected. When a local action is required, as in the case of various forms of neuralgia, the solution should be injected as near as possible to the seat of pain. As some patients are remarkably susceptible to the action of morphia administered in this method, it is advisable to begin with the smallest of the above-named doses.

A scientific committee appointed by the royal medical and chirurgical society of London to investigate the physiological and therapeutical effects of the hypodermic method of injection, have sent in an elaborate report, which was read in June, 1867. Amongst the most important *physiological* facts which were observed, the following may be especially mentioned. Watery solutions of drugs subcutaneously injected were far less rapid in their action than when they were introduced into a vein. On comparing the effects of medicines subcutaneously injected with those produced when they were administered by the mouth, or by injection into the lower bowel, it was found that, in the case of some drugs, the local action was different according to the mode of administration, although the general effects produced were of the same kind. Thus, aconitine given by the mouth affected the salivary glands; when given by the rectum, it caused irritation of the gut; and when given by the skin, it occasioned local pain. The smallest dose fatal to rabbits was, by the mouth, $\frac{1}{60}$th, by the rectum, $\frac{1}{30}$th, and by the skin, $\frac{1}{100}$th of a grain: it was thus five times as energetic when given subcutaneously as when given in the most usual way. The effects of morphia when injected under the skin were also more rapidly manifested and more intense than when given by the mouth or rectum. A solution of podophyllin, which, when administered by the mouth, acts as a powerful cholagogue (bile-provoking) aperient, when injected into the skin, gives rise to free action of the kidneys. The investigations of the *therapeutic* valve of this mode of administering drugs were limited by the fact, that many substances (aconitine, for example) give rise to great local irritation when used subcutaneously. In cases of simple neuralgia, atropine was found to have a very beneficial effect when thus given, and in some cases more permanent relief followed its injection than that of morphia. The value of the latter drug was found to be much increased by this method, the required action being of longer duration, and being produced with greater rapidity and intensity. The same advantages followed this mode of giving quinine in intermittent fevers, but some caution is requisite in giving large doses, as irritation may arise from its presence under the skin. Amongst the conclusions at which the committee arrives are the following: (1) That, as a general rule, only clear neutral solutions of drugs should be employed, decidedly acid or alkaline solutions being apt to cause irritation, and even local ulcers, at the point of application; (2) that, as in the case of podophyllin, symptoms are observed to follow the administration of some drugs by the skin, which are wanting when the same drugs are otherwise administered; and (3) that the advantages to be derived from this method of introducing drugs are (*a*) rapidity of action, (*b*) intensity of effect, (*c*) economy of material, (*d*) certainty of action, (*e*) facility of introduction in certain cases, and (*f*) in some drugs, the avoidance of unpleasant symptoms.

ENDICOTT, JOHN, 1589–1665; b. England. He was sent out by the Massachusetts company in 1628, to oversee the plantation at Salem. He was deputy-governor of Massachusetts for five years, and governor in 1644–49, 1651–54, and 1655–65. He was a rigid puritan, zealous and intolerant in administration after the fashion of those times. While he was governor, four Quakers were executed for defying the law which banished them from the colony on penalty of death if they should return.

ENDIVE, *Cichorium endivia*, an annual or biennial plant, of the same genus with chicory (q.v.), said to be a native of China and Japan, but which is naturalized in the Levant, and has long been in cultivation as a garden vegetable; its blanched root-leaves being much used as a salad, and also sometimes for stewing and in soups. The root-leaves are numerous, smooth, wavy at the margin. The varieties with much curled leaves are preferred. Some of the varieties *boll* of themselves, and are thus blanched; others require to be tied up. In Britain, the seed is usually sown from the middle of May to the end of June, and by a little care and protection, plants may be kept fit for use throughout most of the winter.

ENDLESS SCREW, a screw combined with a cog-wheel, or one acting on the threads of a "female" screw sunk in the edge of a wheel. When the axis of the screw is at right angles to the plane of the wheel—that is, when the screw acts on a spur wheel—it is known as the American form.

ENDLICHER, STEPHEN LADISLAS, a distinguished botanist, was b. at Pressburg in Hungary, June 24, 1804. He was educated in his native town, Pesth, and Vienna, and then entered the church which he, however, abandoned in a few years. In 1827, he commenced his botanical and linguistic studies, and in the following year he was placed at the head of the imperial library at Vienna. In 1836, he was appointed keeper of the museum of natural history at Vienna, and in 1840, he became professor of botany in the university, and director of the botanic gardens. E. was much disturbed by the turn political events had taken in 1848, fell into a state of gloom, and in Mar., 1849, put an end to his own life. A few of his works are upon ecclesiastical subjects, but the great bulk of his writings are botanical, the most important being connected with the systematic arrangement of plants. One of his earliest works was *Flora Posoniensis* (1830); in which he describes the plants growing in the neighborhood of Posen arranged according to the natural system. His most important work *Genera Plantarum secundum ordines naturales deposita*, appeared from 1836 to 1840. In it he follows out with great elaboration the system of natural arrangement. It has had great influence on succeeding botanists, and is still one of the most complete works upon systematic botany. Among his other works are: *Prodromus Floræ Norfolkicæ* (1833); *Iconographia Generum Plantarum* (1838); *Mantissa Botanica* (1843); *Mantissa Botanica Altera* (1843); *Grundzüge der Botanik*, written along with Franz Unger (1843); etc.

ENDOCARDI'TIS, disease of the internal surface of the heart, resulting in the deposit of fibrin upon the valves. See HEART, DISEASES OF.

EN'DOCHROME (Gr. *endon*, and *chroma*, interior color), the coloring matter contained in the tissues of the lower classes of plants. It is a modification of chlorophyll, which gives the green color to the leaves of the higher classes of plants; when the chlorophyll changes its color in the autumn, in consequence, probably, of the retention of the oxygen element of carbonic acid, it is then not strictly chlorophyll, and may be called endochrome. Some chemists say that endochrome and chlorophyll have the same constitution, but it must be remembered that chlorophyll changes in accordance with the action of light.

ENDOG'ENOUS PLANTS, or ENDOGENS (Gr. *endon*, within, and *genos*, birth or origin), one of the great classes into which the vegetable kingdom is divided, the others receiving the corresponding designations of *exogenous plants* and *acrogenous plants*. The character from which this designation is derived is found in the structure of the stem, which does not increase in thickness by additional layers on the outside like the *exogenous* stem, familiarly illustrated in all the trees of the colder parts of the world, but receives its additions of woody matter in the interior; and in general does not continue to increase indefinitely in thickness like the exogenous stem, but is arrested when a certain thickness has been attained, different in different species, and afterwards increases only in length. When a transverse section is made of an endogenous stem, numerous bundles of vessels are seen dispersed irregularly in cellular tissues, the younger and softer parts of the stem exhibiting the cellular tissue in greatest proportion, the older and lower parts chiefly abounding in vascular bundles, which are, however, somewhat scattered in the central part of the stem, and are densely aggregated towards the circumference, there, in the palms generally, forming very hard wood, in some of them wood so hard that it cannot be cut with a hatchet. The stems of E. P. in the far greater number of cases produce terminal buds only, and not lateral buds, and are therefore unbranched. From the bases of the leaves, definite bundles of vascular tissue converge towards the center; but these extending downwards extend also outwards, and thus an interlacing of fibers takes place, which contributes not a little to the strength and compactness of the wood in the lower part of the stem. As the fibers extend downwards, they also become attenuated, spiral and porous vessels disappearing, and nothing but the most ligneous substance remaining. It is the hardening of the outer part of the stem which arrests its increase in thickness. Endogenous stems have not a distinct *pith* nor any *medullary rays*. When the central part is soft and pith-like, yet it is not distinctly separated from the surrounding wood, and has no *medullary sheath*. In many E. P., as in the greater number of grasses, the center of the stem is hollow. This is not the case at first, when the stem begins to grow; and when any cause makes the growth of the stem unusually slow, so that it is much stunted, it remains solid; the fistular character of the stem is the result of its rapid growth, rupturing the cells of the central portion, which finally disappear. Endogenous stems have no *cambium* and no proper *bark*. There is, indeed, a cellular *epidermis;* and there is also within it, and exterior to the hardest woody part of the stem, a comparatively soft layer of a corky substance, which is sometimes called bark, sometimes *false bark*, which does not separate from the wood below it without leaving myriads of little broken threads, the ends of the fibers which have extended into it from the hardest part of the stem. In those exogenous plants which produce lateral buds and branches, the fibers of the branches on descending to the stem extend on the outside of the proper stem, between its hardest portion

and the false bark; and in this way a great thickness is sometimes attained, as in the dragon-tree. In the grasses, a *plexus* of fibers takes place at the nodes, the fibers crossing from one side to the other. No British tree—and it may almost be said, no tree of temperate or colder climates—is endogenous. Almost all the endogenous trees are palms, although a few, as the dragon-tree, belong to other orders. E. P., however, are numerous in all parts of the world. Among E. P. are many of the plants most useful to mankind, particularly palms and grasses, all the true corn-plants being included among the latter. Nutritious substances are very extensively produced both in the fruit or seed, and in other parts; poisonous products are comparatively rare, although found in the *araceæ*, *liliaceæ*, *melanthaceæ*, and other orders. Aromatic secretions are characteristic chiefly of one order, *scitamineæ*. Besides palms and grasses, many of the E. P. are of great beauty, and many produce most beautiful flowers. Lilies and orchids may be mentioned as instances.

E. P. are *monocotyledonous;* and the terms *endogenous* and *monocotyledonous* are therefore often employed indiscriminately to designate the class. But Lindley distinguishes a class of *dictyogens* (q.v.), which, although monocotyledonous, have stems approaching to the exogenous character. The leaves of E. P. generally exhibit parallel venation, which is indeed strictly confined to them, although a venation resembling it, or rather simulating it, may be seen in some exogenous plants. The seed also germinates in a peculiar manner, different from that of exogenous plants, and to which the name *endorhizal* has been given, the radicle being protruded from within the substance of the embryo, and surrounded by a cellular sheath formed from the integument which it breaks in its egress.

ENDORSE. See BILL.

ENDORSE, in heraldry, an ordinary containing the fourth part of a pale. *Endorsed,* again, or *indorsed,* signifies that objects are placed on the shield back to back.

EN'DOSMOSE AND **EX'OSMOSE** (Gr. inward motion and outward motion), terms applied by Dutrochet, the first investigator, to the transfusion that takes place when two liquids or two gases of different densities are separated by an animal or a vegetable membrane. As the transmission has no necessary relation to outwards or inwards, the term *osmose,* or *osmotic action,* is now preferred. See DIFFUSION.

This action performs a very important part in living organisms, and explains many phenomena of the circulation of sap and the processes of nutrition, which were previously referred only to the wonderful action of vital energy. Thus, the blood continually streaming through the capillary vessels gives forth a portion to the surrounding cells, and so supplies them with the necessary chyle. This may, however, by the expansion of the capillary vessels (see INFLAMMATION), lead to immoderate exudation. On the other hand, the blood, in passing by, takes up a number of worn-out constituents of the juices of these cells, and in this way serves, by the exchange which it effects, to restore the body, and to disburden it of products which have become useless.—In plants also, osmose performs an important part in the process of nutrition and the motion of the sap. The substances in the cells of plants are usually denser than the fluids without, and thus a process of endosmose takes place, by which the plant is supplied in the first instance from the soil, being incapable, however, of appropriating any nourishment which is not presented in a liquid state to the fibrils of its roots; whilst that which the roots give off by exosmose, is supposed gradually to unfit the soil for the growth of the same kind of plant. The bursting of the capsules of some kinds of plants is owing to a process of endosmose going on in the cells, as in the fruit of the elaterium or squirting cucumber. Some of the *entozoa,* as tape-worms, seem to live entirely by *endosmose.* See OSMOSE.

ENDOWED SCHOOLS ACTS. The restrictions placed upon the endowed schools of England, both those of royal and private foundation, in regard to terms of admission, course of study, etc., were found inconvenient and injurious to the schools, and the power of parliament was invoked to make certain needful changes; and during the present reign several statutes have been enacted for this purpose. The act 3 and 4 Vict. c. 77 empowered courts of equity to make decrees or orders extending the systems of instructions and the right of admission to any school, and to establish schemes for the application of its resources, having due regard to the intentions of the founder. The act 23 Vict. c. 11 required the trustees and governors of endowed schools to make such order as, without interfering with the religious teaching of the other scholars or authorizing any new religious teaching, should admit children of other denominations than that to which the foundation belongs, except where the foundation expressly requires the children to be instructed according to the formularies of such denomination. The most important public schools—Eton, Harrow, Westminster, etc.—were exempted from the operations of these acts. Another act annexed certain conditions to the appointment of officers in endowed schools. The act of 1869 is most important of all. It authorizes the appointment of commissioners, "with power in such manner as may render any educational endowment (with certain specified exceptions) most conducive to the education of boys and girls, and either of them, to alter and add to any existing, and to make new trusts, directions, and provisions which affect such endowment and the education promoted thereby." A subsequent act continues and amends the act of 1869,

and one still later transfers the power of the endowed schools commissioners to the charity commissioners.

EN'DRÖD, a large village of Hungary, in the county of Bekes-Csanad, on the Körös, 90 m. e.s.e. from Pesth. Pop. 8,700. The surrounding district produces much corn, wine, flax, honey, and cattle.

ENDY'MION, in Greek mythology, was a son either of Zeus or of Aëthlios, and followed, according to some accounts, the occupation of a herdsman or hunter, but according to others, was king of Elis. On account of his uprightness, he is said to have received, at his own request, from Zeus, the gift of immortality, unfading youth, and everlasting sleep; but another version is, that Zeus having taken him up to Olympus, E. fell in love with Here (Juno), and was condemned by her enraged husband to eternal sleep on mount Latmos. Others, again, prettily fable that Selene (the moon), charmed by the beauty of the youth, conveyed him to Caria, and sent him to sleep on mount Latmos, that she might nightly kiss him unobserved. The Eleans, on the contrary, declared that he died among them, and in proof of it were wont to show his monument. The myth of E. has been happily interpreted by Max Müller in his article on comparative mythology, in the *Oxford Essays* (1856). E., according to him, is one of the many names of the sun, but with special reference to the setting or dying sun, being formed from *enduo*, probably a dialectic variety of *duo*, the technical verb in Greek to express sunset. E. sleeps in the cave of Latmos, i.e., of night (from the same root as leto or latona, the night). So far the myth poetically describes certain phenomena of nature, the sinking of the sun in the west, and the rising of the moon, that seems to follow his departing beams. But the original signification of the metaphors becoming lost, as might naturally happen when the words expressing them had only a local usage, it was, we may say, inevitable that people should transfer the metaphors to persons, and invent a history to supply the place of the vanished poetry. And this invention, or more properly, explanation (for it was doubtless made in all good faith), is what properly constitutes the myth of Endymion. The story has been made the subject of a poem by Keats.

ENE'MA (Gr. *en*, in, and *iēmi*, I enter), a medicine or fluid substance conveyed into the body by injection, usually through the rectum or lower bowel. See CLYSTER.

ENEMIES, ADHERING TO THE QUEEN'S. By 25 Edw. III. st. 5, c. 2, it is declared that if a man "be adherent to the king's enemies in his realm, giving them aid and comfort, in the realm or elsewhere," he is to be held guilty of treason. Under this statute, the subjects of states at war with us are held to be enemies, though war has not been solemnly proclaimed. Every species of assistance, whether by joining in acts of hostility, or sending supplies or intelligence to the enemy, is deemed an act of adherence. To incite to hostilities the subjects of a state at amity with us, is not held to fall under this provision. But if the subjects of a friendly state make a hostile invasion, any British subject rendering assistance will be deemed guilty of treason under this clause. See TREASON.

ENEMY. An E., according to the civil law, is one who has publicly declared war against us, or we against him; all others are thieves or robbers. *Hostes hi sunt qui nobis, aut quibus nos, publice bellum decrevimus; cæteri latrones aut prædones sunt.—Digest*, i. 16, 118. Thus, in order to constitute an E., there must be a public declaration of war. This declaration must also be made by a duly organized state or kingdom, for a declaration of war by any turbulent body of men is not sufficient; and a hostile act committed by private citizens will not justify a war, unless that act be sanctioned by the government. The purpose for which this public declaration is required, is stated by Grotius to be that it may be clearly known that the war is undertaken not as a venture, but by the will of the two people. Hostilities having been formally declared, every subject of the hostile nations becomes an E. of the opposing state, as do likewise those independent nations which attach themselves to the interests of either party. According to ancient usage, the utmost violence and cruelty was lawful towards those who were enemies of the state; but by the humane principles which prevail in modern times, warfare is to be carried on subject to certain general rules, which are intended as much as may be to abridge the calamities of war, and to protect the rights of individuals. Thus, an army invading an enemy s country is bound to suffer, as far as possible, the peaceable inhabitants to remain unmolested. Unnecessary devastation of the country and the seizure of property are also contrary to the laws of civilized war; and Grotius lays it down that the use of poisoned weapons, and of assassination, and violence to women, are to be reprobated. On the other hand, individuals taking up arms, without the sanction of the state, in order to annoy an invading E., are regarded as lawless marauders. The result of this distinction is, that such persons are not treated as prisoners of war, but are subject to be summarily dealt with by the commander of the invading army. As to the right of individuals to fit out vessels for the annoyance of the E., see PRIVATEER and PIRACY. It appears to be a recognized principle of international law, that the property of an alien enemy residing in either of the hostile states may be confiscated. The Americans, during the war with England, asserted this right in regard to British property found in their territory. But the usage of civilized nations for a long period has much modified the stern rule of law. It is provided by Magna

Charta, cap. 30, that if merchants "be of a land making war with us, and be found in our realm at the beginning of the wars, they shall be attached without any harm of body or goods, until it be known to us, or our chief-justice, how our merchants be intreated there in the land making war against us; and if our merchants be well intreated there, theirs shall be likewise with us." And by 27 Edw. III. c. 17, merchants of a foreign state at war with us were allowed forty days, after proclamation of hostilities, wherein to remove from the kingdom themselves and their goods; and if that space of time were not sufficient, forty days more were to be conceded to them. Vattel (iii. 4, 63) denies that the right to confiscate the goods of an alien E. is a right inherent in a state by the law of nations, insisting that a sovereign having permitted foreigners to enter the state, and to continue there, had tacitly promised them full liberty and security for their return. Whatever be the principle, there is no doubt that the almost universal practice of modern nations has been to respect the property of individuals at the outbreak of hostilities. Provisions are frequently inserted into commercial treaties, stipulating that, in case of war, the subjects of the E. shall have time to depart, and even that they should be allowed to remain and carry on a peaceable trade. As to the practice in regard to EMBARGO and LETTERS OF MARQUE, see those articles. The right to confiscate the debts of the subjects of a hostile nation appears to rest on the same basis as that of the confiscation of other property. Trade between the subjects of two hostile powers is absolutely suspended during hostilities, unless permitted by express sanction; and the importation of articles particularly useful in war is contraband. All such articles, whether supplied by subjects of the E., or of another state, are seized and confiscated. See CONTRABAND OF WAR; see also PRIZE and PRISONERS OF WAR. On the subject of this article, see Grotius, *De Jure Belli et Pacis*, lib. iii. cc. 3 to 7; Vattel's *Law of Nations*, b. iii. c. 4 and 5; Kent's *Commentaries*, vol. i. c. 3.

ENERGICO, an Italian term in music, meaning with energy and force; with strong articulation and accentuation, and a marked powerful delivery of the single notes, without losing in distinctness of execution.

ENFANTIN, BARTHÉLEMY PROSPER, the chief representative of St. Simonism, and as such, usually styled père Enfantin, was the son of a banker at Paris, where he was born in the year 1796. He became a pupil in the *Ecole Polytechnique* in 1812, but was expelled in 1814, in consequence of his having joined the pupils who left school and fought against the allies on the heights of Montmartre and St. Chaumont. He was afterwards a commercial traveler in Russia, then a banker's clerk, and in 1825, became director of the *Caisse Hypothécaire*. About this time, he became a disciple of St. Simon, whose ideas he developed, after the death of their author, in the *Producteur*. After the July revolution, E. associated himself with M. Bazard for the active propagation of St. Simonism. Bazard preached it in its relations to philosophy and politics; E. mainly in its relations to the social state. Soon, however, a scism broke out between the two on the question of marriage and the relation of the sexes. Recognizing the "mobility" of the affections, E. affirmed that they ought to be "free," and of course pronounced against the ties of marriage. E.'s views were pushed so far, that government deemed it necessary to interfere on the grounds of public decency. The "supreme father" (as his disciples were wont rather profanely to call him) was, after a trial of two days, sentenced to two years' imprisonment, and to pay a fine of 100 francs. Being released at the expiration of a few months, E. went to Egypt, and, after an absence of two years, returned to France, and became a postmaster and farmer in the vicinity of Lyons. In 1841, he came to Paris, and was appointed a member of the scientific commission for Algiers, and on his return from Africa, wrote a sensible, interesting book, entitled *Colonisation de l'Algérie* (Paris, 1843). After the revolution of 1848, he edited the journal entitled *Le Crédit Public*, a paper retaining much of the old St. Simonian character, but which had to stop in 1850 for want of funds. E. afterwards held an important situation on the Lyons and Mediterranean railway. His principal works are his *Doctrine de St. Simon*, in conjunction with others (1830); his *Traité d'Economie Politique; La Religion Saint-Simonienne* (1831); *Moral; Le Livre Nouveau* (1832); *Correspondance Philosophique et Religieuse* (1847); *Correspondance Politique* (1849); *La Vie Eternelle, Passé, Présente, Future* (1861). He died May 31, 1864.

ENFEOFFMENT. See FEOFFMENT.

ENFIELD, a village in Hartford co., Conn., near the Connecticut river, and the New York, New Haven and Hartford railroad, 14 m. n. of Hartford; pop. of township, '70, 6,324. There are carpet factories and extensive powder-mills in the village, the latter said to be the largest in the world. In the town are two or three manufacturing villages, and a community of Shakers.

ENFIELD, a t. in Middlesex, England, 10 m. n.e. of London, noted as the place of manufacture of the Enfield rifle, now the Martini-Henry rifle; pop. '71, 16,054. In the place are the remains of a royal palace in which Edward VI. kept his court.

ENFIELD, WILLIAM, LL.D., 1741–97; an English dissenting preacher; minister in Liverpool in 1763, and subsequently in various other places. Besides many sermons, he published the *Preacher's Directory;* the *English Preacher;* *Institutes of Natural Philosophy, Theoretical and Experimental;* and articles in Aiken's *Biographical Dictionary.*

EN'FIELD RIFLE FACTORY. See SMALL ARMS FACTORIES, ROYAL.

ENFILADE' is a military term applied to a fire of musketry or artillery made in the direction of the length of a line of troops or a line of rampart. A besieging battery so placed as to send its shot along any part of the line of a fortification, and inside the parapet, does great execution in dismounting the guns, which thus present the largest surface to the balls. Hence the lines of rampart should be planned that their prolongations may fall in situations inaccessible to the enemy. Where this is not possible, the lines are either broken, or are protected by bonnets (q.v.), or by traverses (q.v.), or blindages (q.v.). In the siege of a fortress, the trenches of approach are cut in a zigzag, to prevent the defenders enfilading them from the walls.

ENFRANCHISE, ENFRANCHISEMENT, to make free; the admission to certain liberties or privileges. Thus, a person made a denizen of the country, or receiving the freedom of a city or burgh, is said to be enfranchised.

ENFRANCHISEMENT OF COPYHOLDS. See COPYHOLD.

ENGADINE', a famous valley in Switzerland, in the canton of Grisons, second only to the Valais in length, extends n.e. for about 50 m. along the banks of the Inn, from the foot of Mt. Maloja to the village of Martinsbruck. It is divided into two portions—that toward the s.w., called the Upper E., and that toward the n.e., the Lower Engadine. The latter is wild and bleak; pent up within narrow limits among the hills, and having a huge barrier of glaciers between it and Italy, its climate is dismal. Frost and snow occur in July, and winter prevails for nine months of the year. The Upper E. is more open, and possesses much fine meadow-land. The Inn, which enters the valley at its s.w. or upper extremity, and flows through it, has many towns upon its banks, the highest of which, Silvaplana, is about 6,000 ft. above sea-level, while the lowest, Martinsbruck, is 3,320 feet. The inhabitants devote themselves principally to the rearing of cattle; they also make cheese, and export it largely. More than one half of the young men emigrate at an early age, and betake themselves to continental capitals, where they often attain comparative wealth, in which case they almost invariably return, build a house in their native valley, and therein spend the remainder of their days. Pop. about 11,000, almost all of the Reformed or Calvinistic church. The language most generally spoken is the Ladin (a corruption of Latin), a Romanic tongue, but differing from the other Romanic dialects of the Rhaetian Alps, and bearing a resemblance to the Italian.

ENGAGEMENT, MILITARY, considered as a conflict between two armies or hostile forces, cannot be described within limits suitable for this work. Almost every term applicable to armies in the field bears relation, in some way or other, to a hostile engagement, and those terms will be found briefly noticed under their proper headings.

ENGAGEMENT, NAVAL, admits of more precise and terse illustration than a military engagement, because each ship of war is a unit in itself, bounded by a clearly marked watery margin from all the other ships of a fleet.

In the small war-vessels of ancient times, before the invention of gunpowder, a naval E. usually began by running the galleys violently against each other, to crush or sink the enemy by means of the beak or prow. The prows were, for this purpose, armed with brazen or iron points. On the deck was sometimes a kind of turret filled with soldiers, the probable precursor of the *forecastle* in modern ships; and there was also frequently a platform for accommodating swordsmen, slingers, and javelin-men. High and bulky ships, of no great length, were best for this kind of warfare. Sometimes a massive piece of iron or lead, called a *dolphin*, was let down violently from the yard-arm, to crush or break through some part of the enemy's vessel. The men fastened sickles to the end of long poles to cut the enemy's rigging and sails. Other means for carrying on a hostile attack were *battering-rams*—heavy maces with very long handles, stone-throwing machines, and grappling-irons.

In modern ships, preparations for an E. are made with the utmost coolness and precision. The boatswain and his mates communicate to all the crew the order to "clear for action." The men take their hammocks, lower them, tie them up, and carry them to the quarter-deck, poop, forecastle, and other parts of the ship, where they are stowed between a double netting above the gunwale, and form a partial defense against the enemy's musketry. The sails, yards, booms, bowsprit, etc., are secured by strong chains and extra ropes, to prevent or lessen disaster if they are shot away. The boatswain and the carpenter collect together, and place at hand all kinds of pieces of wood, iron, rope, and canvas that may be useful in quickly repairing shot-holes and other damage. The gunner and his mates examine the cannon and the filled cartridges, and see that all the implements for gunnery are at hand. The master and his subordinate officers look to the trim and state of the sails. The lieutenants visit all the decks, to see that obstructions of every kind are removed. When the E. is about to begin, the drums beat to arms. Every man repairs to his place. The marines are drawn up in rank and file on the quarter-deck, poop, and forecastle. The surgeon and his assistants are ready in the cockpit to amputate limbs, extract bullets, and dress wounds. Then begins the battle, which varies in its character according to the number and kind of ships on each side, the nature of the sea, the direction of the wind, and a multitude of

other circumstances. In the British navy, the order of battle for a fleet is ordinarily in two lines, each being divided into the starboard and port division or squadron. When the battle is ended, if it has been a severe one, the probabilities are that many men have been killed or wounded, decks and sides battered and splintered, cannon dismounted, rigging, masts, yards, and sails destroyed or torn. The whole ship's crew, except those disabled, then work hard to get the vessel back into trim; an attempt that frequently cannot be realized without aid from other ships, or from the resources of a port.

ENG AND CHANG. See SIAMESE TWINS (*ante*).

EN-GEDI (meaning in Hebrew "the fountain of the kid," and corresponding to the Arabic "Ain-Jidy") is the name of a wilderness, a mountain pass, a ruined village, and a perennial fountain on the w. side of the Dead sea, half way between its northern and southern ends. In the days of Abraham it was the site of a city named Hazezon-ta-mar, *cutting of palm trees*, doubtless with reference to the grove of trees which then grew around the fountain. In its strongholds was the home of the Amorites, who were, at that time, attacked and destroyed by the Assyrians and their allies. Here in "the city of palm-trees," at the time of the exodus from Egypt, a branch of the Kenites lived concerning whom Balaam said—"Strong is thy dwelling place, and thou puttest they nest in the rock." After the conquest of Canaan they left this fortress and went up to dwell with the tribe of Judah. Four hundred years later, David fled for refuge into the strongholds of En-gedi. When Saul heard this he "took 3,000 chosen men and went to seek David and his men on the rocks of the wild goats." Entering one of the numerous caverns, it proved to be the very one in the sides of which the fugitives were concealed. David, refusing to lift his hand against the king, and forbidding his followers to touch him, cut off the skirt of his robe, as proof of what he might have done, and let him depart. After David, Solomon celebrated in his "song of songs" the vineyards of En-gedi, which, as the ruins still show, were planted all along the terraced side of the mountain. About 1000 years later the Jewish sect of the Essenes, in their progressive efforts to isolate themselves from all the impurities of life, chose at last as their retreat the absolute solitude of the caverns around the fountain of En-gedi. Four hundred years afterwards there was a large village on the coast below the fountain, the ruins of which yet remain. And 1400 years later still (A.D. 1838), two American travelers on their way to the Dead sea, descending the mountain by a terrific pass, more difficult and dangerous than the heights of Lebanon or of the Alps, in zigzag directions, at very steep angles, over rock as smooth as glass but of irregular surface, first along ledges on the perpendicular face of the cliff, and then down the precipitous sides, came at length to the beautiful fountain, bursting forth a fine stream on a narrow shelf of rock and rushing down the steep descent of 400 ft. into the sea in a course hidden from view by the luxuriant thicket of trees and shrubs with which its waters have clothed the rocks. And on the rocks the wild goats still roamed, secure as they had done 3,700 years before, when the fountain was named.

ENGELBERT, SAINT, 1185–1225; in 1215, elector of the empire and archbishop of Cologne. He was regent in Germany while the emperor Frederick II. visited Italy. He reformed the clergy, aggrandized the church, and curbed the power of the nobles. Engelbert was murdered by his nephew, count von Isenberg, who was broken on the wheel, and his fellow conspirators, the bishops of Münster and Osnabrück, were excommunicated.

ENGELHARDT, JOH. GEORG VEIT, a learned German theologian, was b. 12th Nov., 1791, at Neustadt on the Aisch, and studied at Erlangen, where, in 1820, he was appointed extraordinary professor, and in 1822 ordinary professor of theology. He died 13th Sept., 1853. Patristic and mediæval dogmatics, and Neoplatonism, are the subjects which he has chiefly investigated. In 1820, he published at Erlangen a translation of the first *Ennead* of Plotinus; in 1823 appeared his translation of the writings ascribed to Dionysius the Areopagite. His *Kirchengeschichtchen Abhandlungen* (Erl. 1832), *Auslegung des speculativen Theils des Evangeliums Johannis durch einen deutschen mystichen Theologen* (Erl. 1839), and his contribution to the history of the mystical theology, entitled *Richard von St. Victor und Johannes Ruysbroek* (Erl. 1838), are works of great value, and have thrown a new light on many important points. Very useful, too, especially on account of the richness of their special notices, are his *Handbuch der Kirchengeschichte* (Erl. 1834), and *Dogmengeschichte* (Neustadt, 1839). E., in the course of his life, wrote many learned dissertations in the *Journal of Historical Theology*, among which may be specified his *Ueber die Hesychiasten*, and *Ueber Erasmus Sarcerius*.

ENGHIEN, LOUIS ANTOINE HENRI DE BOURBON, Duc d', only son of prince Henri Louis Joseph, Duc de Bourbon, was b. at Chantilly, 2d Aug., 1772. In 1789, he quitted France, and traveled through several countries of Europe. In 1792, he entered the corps of *émigrés* assembled by his grandfather, the prince of Condé, on the Rhine, and commanded the vanguard from 1796 until 1799. At the peace of Lunéville, in the year 1801, he went to reside at Ettenheim, an old château on the German side of the Rhine, not far from Strasburg, and within the territories of the duke of Baden. Here he married the princess Charlotte of Rohan Rochefort, and lived as a private citizen. When the conspiracy of the Bourbon princes, headed by Cadoudal, Pichegru, etc., against the

life and authority of Bonaparte, was discovered at Paris, the latter chose to believe that the duc d'E. was privy to it, although there was not a tittle of evidence to prove this. Perhaps Bonaparte was afraid that the valor and humanity of the last descendant of the great Condé might one day prove dangerous to his power. Be that as it may, he unscrupulously resolved to seize the person of the duke. On the night of the 17th Mar., 1804, the neutral territory of Baden was violated, and the château of Ettenheim surrounded with a body of soldiers and gendarmes. The duke, at first, endeavored to defend himself; but the force was too great to be opposed, and he, with several friends and domestics, was captured, and carried prisoner to Strasburg, and immediatly after to Vincennes. On the 20th of Mar., he was tried before a court-martial, consisting of eight officers, and after an examination of five hours, was condemned to death. Half an hour later, the sentence was put into execution. So cruel and audaciously criminal an act has fixed a deep stigma on the character of Bonaparte. M. Dupin has published the records of the trial, and shown the illegality of the proceedings of the military commission. This illegality was publicly acknowledged by gen. Hullin, the president of the court. After the restoration, the bones of the judicially murdered duke were taken up, and interred in the chapel of the castle at Vincennes.

ENGINEER AND ENGINEERING. Engineering, the business of the engineer, is the art of designing and superintending the execution of works of a constructive character, such as roads, railways, bridges, canals, harbors, docks, works for supplying water to towns, drainage and sewerage works, mining machinery, and the working of metals.

It may be divided into two kinds—civil and military. The military engineer is an officer in the service of government, whose duties are principally to construct fortifications, to make surveys for warlike purposes, to facilitate the passage of an army by the construction of roads and bridges; in short, to execute all engineering works of a military nature; but he is also, especially in this country, called upon to undertake many works which more properly belong to the business of the civil engineer, such as the survey of the country—called the ordnance survey—the inspection of public works, and, in short, all the duties of a government engineer.

The civil engineering profession is subdivided into several sections, according to the special nature of the employment of its members. The railway engineer projects and superintends the execution of railways and all the works in connection with them, such as the alteration of roads and streams, the construction of viaducts, bridges, cuttings, and embankments. The hydraulic engineer constructs the works connected with the supply of water to towns, the filtering of water, its collection in reservoirs, and its distribution through a town or district; the irrigation and drainage of tracts of country; the protection of low lands from inundation, and the use of water as a motive-power. The dock and harbor engineer has the management of all works connected with the sea or navigable waters, such as the construction of piers, breakwaters, docks, harbors, and light-houses. The mechanical engineer is principally concerned in the manufacture of machinery, the working of metals, the construction of ships, steamers, cannon, and all the various structures in which the metals bear a prominent part. Then there is the mining engineer, who discovers minerals and manages mines; there are engineers who are specially engaged in the drainage of towns, and many other less prominent divisions of the profession.

In all engineering works, the *contractor* takes a very important part; he executes the works from the designs, and under the direction and superintendence of the engineer, and on his ability and good management the success of undertakings very materially depends.

The engineering works of antiquity are both numerous and prominent, many of them remaining while all other traces of their constructors have been swept away. The most notable of the works belonging to very remote antiquity are the harbors of the Phenicians, the palaces and sewerage of Nimroud, and the pyramids of Egypt; next in order come the harbors of ancient Greece, the bridge of boats across the Dardanelles, made by Xerxes, to transport his immense army into Europe, and his canal across the isthmus of the peninsula of mount Athos. The buildings of ancient Rome next claim attention—its theaters, temples, baths, and aqueducts, some of which carried water from distances of more than 50 m. into Rome; its roads, bridges, and drainage-works vie in extent and magnificence with the most celebrated works of modern times.

From that period down to the commencement of the 18th c., the most extensive works executed are the canals, embankments, and other hydraulic constructions used by the Dutch for the purposes of inland navigation, and to protect their low lands from the sea; the canals of North Italy, the cathedrals and fortifications of mediæval Europe.

Civil engineering, as a distinct *profession*, may be said to have originated, in England, about the middle of the last century; since that time, the improvements in the steam-engine by James Watt, its subsequent application to the railway system by George Stephenson, and its use in navigation, have given a great impulse to commerce and civilization; which, in their turn, have created the necessity for the numerous and magnificent engineering works of modern times; such as the innumerable railways,

roads, and canals that intersect this and foreign countries; the bridges, water-works, docks, harbors, and vessels that facilitate our commerce and increase our comfort and prosperity. Among the most remarkable of these works may be mentioned the tubular bridges of the St. Lawrence and Menai strait, the Niagara railway suspension bridge, and the electric telegraph system, which covers this country and the seas and countries of Europe, and may, at some future time, connect us with the continents of America, Australia, and India. Among the more celebrated British engineers are the Stephensons, the Rennies, the Brunels, Telford, Smeaton, and Locke.

The education of those who would rise to eminence in the profession, must embrace a fair knowledge of pure mathematics and of the mixed sciences of natural philosophy, such as mechanics, hydrostatics, hydraulics, and optics. They should acquire a knowledge of the principles of projections, and should aim at being good draughtsmen and rapid and accurate arithmeticians.

Engineering is represented in this country by several institutions and societies, the principal of which is the London institution of civil engineers, established in 1818, "for facilitating the acquirement of professional knowledge, and for promoting mechanical philosophy;" there are also many schools and colleges throughout the kingdom in which engineering is made a special study.

In conclusion, it may be said that every day opens fresh fields to engineering science and labor; and that as the first beginnings of the art are lost in the obscurity of remote antiquity, so we see no termination to its usefulness and necessity.

The more important operations involved in engineering are treated of under such heads as BRIDGES, CANALS, AQUEDUCTS, EMBANKMENT, TUBULAR BRIDGE, ROADS AND ROAD-MAKING, RAILWAYS, RIVER, SUSPENSION BRIDGES, etc.

ENGINEERS, CORPS OF, organized in the United States in 1802, to consist of one col., one lieut.col., two majors, four captains, four first and second lieutenants, and cadets—the whole number not to exceed 20—to be stationed at West Point, and to constitute a military academy. In 1838, the corps was increased to 47 officers, and a corps of topographical engineers in addition was organized. In 1846, sappers, miners, and pontoniers (bridge builders) were added. In 1861, on the beginning of the rebellion, three additional companie s were provided for, and one of topographical engineers was added. This company was disbanded in 1863, and its officers sent to the corps of engineers. At present the corps has one chief, six colonels, 12 lieutenants, 24 majors, 30 captains, 26 first lieutenants, and 10 second lieutenants. The corps is a special arm of the service, charged with the selection and purchase of sites, and the constructing of fortifications; the examination and removal of obstructions in streams; with works of defense and attack at fixed places, besides important field duties in preparing for the movement of forces. The corps have also to plan and superintend harbor and river improvements; to make surveys and geographical explorations, etc. Until 1866, the engineer corps had the superintendence of the West Point academy, but since that year all branches of the service are admitted to their share of supervision.

ENGINEERS IN THE UNITED STATES NAVY, are commissioned officers having charge of the machinery of steam vessels. They must have a thorough practical education in the construction and management of steam machinery. In military law, they are considered non-combatants.

ENGINEERS, THE ROYAL CORPS OF, forms one component portion of the army of the British empire. A similar corps exists in all regular armies. It is the scientific and constructive branch, intrusted with the making and defending of all military *works*, and the attack and conquest of similar works belonging to an enemy. It is true that civilians are often employed to construct the buildings themselves, at a stated price; but the military engineers make the plans, and are responsible to the country for their efficiency. At the present time, for instance, and for a number of years past, contractors are at work on fortifications at Portsmouth and in other parts of the kingdom, but on plans and under orders for which the engineer department of the government is responsible.

The royal engineers of the United Kingdom form one regiment or corps. The officers, in time of peace, are scattered all over the world. There is no half-pay, except on *permanent* retirement; and no unemployed list. They have much wear and tear of body and mind, and are considered entitled to a competent retiring allowance at an earlier age than other officers. Their regular pay corresponds to the active pay of other officers of the same rank; but they exclusively receive in addition *extra* pay, amounting to one-half their ordinary pay when on duty at home, and equaling their ordinary pay when employed abroad or in the London district. There is an establishment of engineers in each military command, to conduct and superintend all the military buildings and works. The entire force is under a particular department of the war-office, that of the inspector-gen. of fortifications. Until the year 1763, the duties of military engineers were discharged by officers taken from the regular army. In that year, however, the corps of engineers was formed, greatly to the advantage of the military service. In 1783, it was made a *royal* corps, and a distinctive uniform adopted. Several companies of artificers were, in 1812, converted into sappers and miners, and placed under the engineers.

The non-commissioned officers and privates of this valuable corps are all workmen

who have learned some mechanical trade; hence their skill in all constructive operations. The ordnance survey has been intrusted to the corps. For many purposes, the men are *lent*, to attend to special and peculiar work; and at such times their emolument is always increased. They often buy their discharge, in order to go into civil employments, when the prospects are good. The men enlist for 12 years, with power to re-engage (if wanted) for nine more; but they can purchase their discharge at any time. They have to pay more for their discharge than other corps in the army, having received more instruction at the national expense. Officers intended for the engineers enter the royal military academy as cadets by open competition, and pass out from time to time for commissions. When in the corps, promotion is by seniority, the purchase system having never been introduced. The army estimates for 1878–79 provided for the following number of officers and men in the corps of royal engineers:

Officers	393
Non-commissioned officers	662
Rank and file	4,158
	5,213
Horses	423

The sum set down for their pay for the year was £232,319, which, however, does not include any commissariat charges. The head-quarters are at Chatham, where there are engineer barracks. The corps is grouped into battalions and companies. In addition to the numbers shown above, there are 432 officers of royal engineers serving in India, their subordinates being natives.

ENGINEERS, in the royal navy, are the persons who attend to the machinery on board the war-steamers. When such steamers were at first adopted, men were obtained from private engineering establishments, or from merchant-steamers. In 1847 and 1848, many changes were made, to induce skillful and steady men to enter the service, and to maintain better discipline. The higher grades of them were raised from the rank of *warrant* officers to that of *commissioned* officers of a civil branch. There are now the grades of chief inspector of machinery afloat, inspector of machinery afloat, chief-engineer, engineer, and assistant-engineer, the last rank being subdivided into two classes. All these are commissioned officers, and are strictly examined before admission; their rank and promotion being by selection, and dependent on skill, character, and length of service. A chief-engineer is expected to be able to make notes in the log of every particular concerning the engines and boilers; to draw rough sketches of the machinery, with figured dimensions fit to work from; to understand and manage everything relating to engines, boilers, and furnaces; to understand practical mechanism generally, and the principles of theoretical mechanism. The engineer and assistant-engineer are expected to possess, in a smaller degree, the same kinds of knowledge and skill. The pay varies from £511 for a chief inspector of machinery, down to £64 for a second-class assistant-engineer on harbor service.

The navy estimates for 1878–79 provided for 156 chief-engineers, and 637 engineers and assistant-engineers.

ENGLAND, the southern and larger section of the island of Great Britain, and the most important member of the United Kingdom of Great Britain and Ireland. The geography of E. will be found under the head of GREAT BRITAIN, the present article being confined to a sketch of its history previous to the union with Scotland.

Of the inhabitants of E. before the Christian era, little is known. In some of the ancient geographers, there are a few scattered notices of a rude population, with whom a limited commerce in tin was carried on by the Phenician merchants; and our information scarcely extends further. What is known of E. under the Roman occupation has already been embodied in the article BRITANNIA. An account of the country during the period intervening between the withdrawal of the Romans and the Norman conquest will be found in the article ANGLO-SAXONS.

When William of Normandy landed in E. to claim the crown which Edward the confessor had bequeathed to him, he found that the people had raised to the throne Harold, the son of a popular nobleman. The resources of the Saxons, however, had been wasted in domestic conflicts before the attack of William; and the battle of Hastings (1066 A.D.) gave E. with comparative ease to the Normans. The next 20 years saw the conquest completed, and nearly all the large landed estates of the Saxons pass, on every pretext except the true one, into the hands of the Normans. William claimed, indeed, to rule as sovereign by hereditary right, but this made little difference to the fact of conquest. All the high offices in the state and in the church passed into the hands of a new race. The Danes alone could retain either property or dignity. For long, some of the Saxons maintained an unequal resistance, retiring to the forests as the outlaws whose adventures furnished the materials for those favorite popular legends, where, as in Robin Hood, the spoiling of the richer classes is depicted as one of the chief virtues. In the course of time, the Normans were absorbed among the Saxons, their very language disappearing, though leaving many traces. From this union arose the English people and the English language as they now exist.

The union of the Normans with the Saxons was not fully effected so long as the

Normans retained their foreign possessions. In king John's reign, the whole of these were lost, excepting Guienne and Poitou. Long wars under Henry III. and Edward III., and his famous son, the Black prince, were continued, in the endeavor to regain the lost possessions; yet great victories like those of Cressy (1346 A.D.) and Poitiers (1356 A.D.) seemed to leave no result, for no sooner were the English armies withdrawn, than the population returned to their French allegiance. After Agincourt (1415 A.D.), Henry V., when he had forced himself to be acknowledged heir to the French throne, was virtually king of France, and held his court in Paris; yet, in a few years more, the rebellion of Joan of Arc came at a time when E. was weakened with the wars of the roses, and (1451 A.D.) nothing of foreign ground was left to this country excepting Calais.

To their efforts to conquer France, the Norman kings added others. Henry II. conquered Ireland (1171 A.D.), Edward I. conquered Wales (1285 A.D.), and had almost added Scotland to his dominions. The bravery of Wallace and Bruce defeated the armies of Edward II., his successor; and though the idea of the conquest of Scotland was always a favorite one, an opportunity for attempting it on a great scale never again presented itself.

The great struggles of the successors of William were with the ecclesiastics and with the barons. Sometimes in these the popular sympathies were with, and sometimes against the crown. The conqueror himself and his immediate successors had no difficulty in maintaining the superiority of the courts of justice over the ecclesiastics; but even a sovereign so bold and skillful as Henry II. was forced, after the outcry occasioned by the murder of Thomas-à-Becket (1170 A.D.), to yield the point. The right to nominate the higher ecclesiastics was also secured by the popes. The degradation of the English monarchy was at its lowest when king John consented (1213 A.D.) to hold the crown as a gift from Rome. The weaknesses of this monarch had good as well as evil results, for from him the barons won their great charter (1215 A.D.). From Henry II. something similar had already been gained; but it was the Magna Charta of John which firmly established two great English principles—that no man should suffer arbitrary imprisonment, and that no tax should be imposed without the consent of the council of the nation. Under Edward I., the famous statute that no manner of tax should be imposed without the common consent of the bishops, barons, and burgesses of the realm, was passed (1296 A.D.); and before the time of Henry VII., the foundations of parliamentary government had been laid.

The union of the houses of York and Lancaster under Henry VII. begins a new period in English history. Part of his reign was disturbed by Perkin Warbeck and other pretenders to the throne, in support of whose claims the turbulent nobles found vent for their restlessness. But the greater part of his long reign was distinguished from preceding reigns as a time of peace and economy. During it, men's minds ripened for the great events of the next reign. Henry VIII. succeeded, under the most favorable auspices. He found the alliance of his now important country courted by both of his great contemporaries, Francis I. and Charles V. But the interest of the foreign complications of the reign merges in the struggle between the courts of E. and of Rome. The origin of the contest was the divorce which Henry desired to have from Catharine of Aragon, his brother's widow, to whom he had been married by papal license. Cranmer and the English church pronounced the marriage to be null, but a formal decree of divorce by the head of the church was then thought necessary in Catholic Europe. Pope Clement and the consistory, influenced by Spanish counsels, delayed, by every possible means, the decision of the question. E., however, was ready enough to support Henry. Wickliffe and his adherents had done not a little to shake the attachment of the nation to a foreign spiritual authority, by preaching doctrines which dispensed with the necessity for it. A parliament met, when the commons took the significant step of presenting a long memorial of complaints against the church. The pope, still showing no signs of yielding, bills followed, declaring the king the head of the church; rendering the inferior clergy amenable to the civil courts; abolishing the payment of the first year's fruits of ecclesiastical livings to Rome; and perhaps a more important thing than any of these, declaring that no convocation should meet unless the king should summon it, and that no ecclesiastical canons should have force except with the king's consent. To these measures, the pope replied by refusing the divorce, and excommunicating the king (1533 A.D.). The breach thus became irreparable.

A new act was passed giving to the magistrates the power of judging in questions of heresy. The next step was the suppression of nearly 400 of the smaller monasteries. The subsidence of an insignificant popular reaction, incited by the lower clergy, was followed by the suppression of the great abbeys. All these changes, however, touched only matters of church government. On matters of faith, Henry and his parliaments were as orthodox as the most conservative could wish. They embodied the leading doctrines of Romanism, disputed by the Protestants, in an act of parliament, known among the people as "the bloody six articles," and enforced conformity under severe penalties.

Henry was succeeded by Edward VI. His reign was marked by the general progress which the reformation now made from questions of government to questions of doctrine. More thoroughly than ever the power of the clergy was sapped. The Book of

Common Prayer (1548 A.D.) deprived them of the mysterious authority which the use of a foreign language in worship gave them in the eyes of the people, and the 42 articles of the church of E. (1552 A.D.), the foundation of the present 39, denied, among other things, their power to work miracles in the elevation of the mass.

The next reign saw the inevitable reaction. The superstitions of the populace had been too rudely handled, and—as often happens before a crisis—there came a period of physical suffering. The conversion of cornfields into sheep-walks, induced by the high value of wool as an article of export, had thrown many out of employment, and the country was, moreover, infested with the crowd of vagrants whom the monasteries had been wont to maintain. The popular dissatisfaction coupled these things with the reformation. Thus the opportunity was prepared for the atrocities of the reign of Mary. The queen herself was interested, by her mother's honor and her own, to uphold the Romanist faith; and her gloomy temper, aggravated by her unhappy childless marriage, believed that it did true service to God when it gave the rein to the bigotry of Pole and Bonner. In her first parliament (1553 A.D.), the whole legislation of Edward VI. was repealed, leaving the church of E. one in ceremonial and doctrine with the church of Rome. Another parliament (1555 A.D.) repealed the legislation of Henry VIII., thus re-establishing the papal supremacy. Everything that the reformers had done was thus undone. Still the adherents of the reformation were numerous, and when legislation failed to convert them, the fires of Smithfield were tried. Hooper, bishop of Gloucester, was one of the first to suffer. Latimer, Ridley, Cranmer, followed, and the number who perished is not less than 300 by fire, and 100 by torture and the cruelties of confinement. Nothing more was wanted to turn the popular mind at once and forever from the church of Rome.

The accession of the Protestant princess Elizabeth came as a relief to the whole nation. The Romanists themselves were weary of the policy which made E. the tool of Spain, and were sickened with the cruelties which had been enacted. Elizabeth began by releasing from prison all confined on charges of heresy. Parliament followed (1559 A.D.) with acts restoring the royal supremacy over the church, and returning in general to the legislation of Edward VI. The prayer-book and the 39 articles were adjusted as they still exist. Fortunately for the country, the ministry of Elizabeth, guided by the able hand of Cecil, was one of peace. No opportunity was lost of aiding the Protestant cause throughout Europe; but Elizabeth had almost no open wars, and her long reign was disturbed by almost no domestic collisions. The mistake committed in detaining the queen of Scotland in an English prison, gave a constant incitement to disaffection among the adherents of the old faith, but no serious consequences ensued. Towards the close of the reign, Protestant and Catholic were alike patriotic in repelling the Armada (1588 A.D.). On the death of Elizabeth, the crowns of E. and Scotland were united.

The reign of James VI does not present much that is remarkable. The plot, for which sir Walter Raleigh suffered long afterwards, and the Gunpowder plot—the insignificant proportions of which were so magnified for factious purposes—disturbed the earlier years; and the close of the reign found the nation engaged in an unfortunate war to assist the king's son-in-law, Frederick, elector of Bohemia, against the emperor Ferdinand II. of Germany. But for the greater portion of the 23 years of the reign there was neither foreign nor domestic war. These years the king occupied industriously in rendering monarchy odious and contemptible. He lavished money upon unworthy favorites, and to supply his extravagance, openly sold the dignities of the peerage and the other honors of the state. His personal demeanor was vain, weak, and ridiculous; but in contrast with the insignificance of his talents was his extravagant conception of the extent of his royal prerogative. His conduct occasioned great discontent in parliament, and but for his timidity might have led to more serious consequences.

The misfortunes of Charles I. were the legitimate result of the principles of his father. Charles committed the mistake of repeating, in the 17th c., acts which the Plantagenet sovereigns had done with impunity in the 14th and 15th. One of his first acts was to exact a benevolence to carry on the war. Had he been successful, this might have been overlooked, but when the bad management of the duke of Buckingham lost the fleet off Rochelle, the indignation of the commons was without bounds. In place of taking measures to allay this feeling, the king dissolved the parliament, and resolved to govern without calling another. In 1630, he concluded peace, and for the next seven years, in council with Strafford and Laud, he carried on the government. Taxes were raised as before without parliamentary authority; and when the taxes failed, money was raised by selling to the Roman Catholics immunities from the penal laws against their worship.

Nevertheless, there were limits to these methods of raising money; and in 1637, when the king found himself involved in a war with Scotland, in consequence of his endeavor to introduce a liturgy there, he was compelled to call a parliament. The commons refused supplies, and were again dissolved. In 1640, the king once more summoned a parliament. He found the temper of the houses more indomitable than ever. In place of voting him supplies, they impeached his minister Strafford, and condemned him to death. The commons then presented a grand remonstrance to the king, embodying all the grievances the nation had suffered since the death of Elizabeth. Matters proceeded from bad to worse, till an open rupture came, and an appeal was made to arms. In Aug.,

1642, the king erected his standard at Nottingham, while the rebels took arms under the earl of Essex. The first conflict was at Edgehill, where the loss on both sides was severe and nearly equal. The fortune of war continued to vary, till at Marston moor it turned against Charles, and at Naseby, in June, 1645, he was finally defeated. He was executed on 30th Jan., 1649.

The government for the next four years was conducted by parliament. Meanwhile, Cromwell was rising into distinction, and power gradually fell from the hands of parliament into those of the military. In 1653, Cromwell had himself proclaimed "protector." He was now absolute monarch. He governed with a firm hand, and never was E. more respected abroad than during his time. In 1654, he concluded peace with Holland, and employed the gallant admiral Blake in an expedition against the Spaniards, which ended brilliantly for the English navy. But the nation grew as discontented with the government of Cromwell as it had been with that of Charles. After the death of the protector in 1658, and a short interval during which his son Richard held the office, parliament received with acclamations a proposal from Charles II. to return. In May, 1660, the populace clamored with delight on the royal entry to London of him who, a few years before, had fled from Worcester for his life.

While Clarendon was minister, the government of Charles II. was well conducted. A war with Holland was brought to a successful ending in the conquest of New York. On Clarendon's resignation, the government passed into the hands of the ministry known as the Cabal. They were as profligate and as careless as the king himself. A succession of cruelties against the Catholics, for which the pretended revelations of Titus Oates and his imitators furnished the excuse, betokened rather the wanton temper of the sovereign and the nation, than any zeal for the Protestant religion. The only act which reflects much credit on any portion of the reign was the passing, in 1679, of the *habeas corpus* act, designed more effectually to protect the liberty of the person. Strong efforts were made in parliament after that to pass the exclusion bill, the object of which was to exclude the duke of York, as a Roman Catholic, from the succession. To the great satisfaction of the king, parliament rejected the bill. In 1681, parliament was dissolved, and Charles II. never called another.

After this there was a change for the worse in the character of the government; from being wantonly indifferent, it became sullenly mischievous. Presbyterians and nonconformists were excluded from all offices. Among other arbitrary acts, may be mentioned the recall of their charters from London and many of the other principal cities, which were only restored, with diminished privileges, on payment of heavy fines. Conduct such as this made men more than ever afraid of the succession of the king's brother. A conspiracy to secure the succession to the duke of Monmouth, an illegitimate son of the king, was formed. Lord Howard betrayed the conspiracy, and among others who suffered death for it were lord Russell and Algernon Sidney.

When the king died, in 1685, James II. succeeded amid universal dissatisfaction. Monmouth's attempt to seize the throne, however, was mismanaged, and failed. The punishment of those who had aided his rising formed an occasion for the perpetration of great cruelties by Jeffreys, then chief-justice of England. In the meantime, nothing could be fairer than the king's language. He issued a declaration in favor of general toleration, and announced that the penal laws against Catholics were no longer to be enforced. A second declaration to the same effect was issued, but he went further, and added to it an order that the clergy should read it in all churches. The archbishop of Canterbury and six bishops presented an address to the throne, humbly setting forth that their duty to maintain the Protestant establishment would not permit them to give obedience to the royal mandate. For this they were indicted as guilty of sedition. The trial of the bishops (1688 A.D.) was the turning-point of James's career. It created immense excitement, and when the jury returned a verdict of not guilty, even the soldiers joined in the tumultuous rejoicings.

William, prince of Orange, who had married Mary, the eldest daughter of the king, had long been intriguing with the malcontents. He now landed in E. with a small body of troops. The soldiers, the leading nobles, even the king's own children, joining the prince, the king fled to France. Parliament then settled the crown jointly on William and Mary for life. James, with the assistance of Louis XIV., made one effort to regain his throne. He landed in Ireland, where the lord lieutenant, Tyrconnel, was devoted to his cause, and managed to raise an army. William defeated him at the battle of the Boyne; and the contest was soon after this terminated by the second flight of James to France. So easily was the great revolution of 1688 effected.

The domestic government of William was marked by his efforts to introduce a general toleration; but of his foreign administration, which led the country into costly wars, it is hardly possible to speak in very favorable terms. To reduce the threatening power of France, E., in alliance with Holland and Germany, embarked in a protracted contest. Its termination at the peace of Ryswick, in 1697, brought to E. nothing beyond an increase of reputation. William died in 1702.

Under queen Anne, the war with France was renewed, and the duke of Marlborough's splendid victories of Oudenarde, Blenheim, and Ramilies were achieved. With these the history of E. as a separate state closes. In 1707, the long-wished-for union with Scotland was accomplished; and after that, Great Britain, united under one legislature,

as well as under one crown, has a common interest among nations, and therefore a common history.

A table of the English sovereigns is appended, beginning with Alfred, and continued, for convenience' sake, to the present time:

	Began to Reign.	Years of Reign.
ANGLO-SAXON LINE.		
Alfred, king of Wessex	871	30
Edward I., king of Wessex, Mercia, etc	901	24
Athelstan, king of England	925	15

ENGLAND, CHURCH OF. A brief sketch of the origin and early history, as well as an outline of the doctrines and form of government of this church, will be found under the head ANGLO CATHOLIC CHURCH. See also the articles AUGUSTINE and DUNSTAN. Up to the time of the reformation, ecclesiastical affairs would be more properly described as the history of the church *in* England; from that period the church *of* England dates her existence. She, however, retains so much of antiquity, and her institutions, laws, and formularies are so interwoven with the history of the past, that it would be impossible to have any correct or connected view of them, and of her *connection with the state*, her characteristic feature, without at least glancing rapidly over the leading events between the conquest and the reign of Henry VIII. During the three centuries from the Norman conquest (1066) to the preaching of Wickliffe (1356), her history can be regarded only as a continual struggle between the ecclesiastical and civil power, and there would be little else to describe than the methods by which the miter triumphed over the crown, and the crown invaded the rights and property of the church. In the time of William I., nearly half the country was in the hands of spiritual persons. He ejected the English clergy, and supplanted them with Normans; and although he was possessed of full power over the church, yet in his reign were sown the seeds of future papal encroachments. Papal legates were then first introduced into England, and the ecclesiastical courts separated from the civil. From this time, the increased influence of Rome may be traced to the defective titles, the usurpations, and the violent conduct of the kings. Thus, the defective title of Henry I. made him seek popularity by recalling the primate Anselm, who had incurred the displeasure of his brother William, and had fled the country. Anselm was devoted to the pope, who had espoused his quarrel, and refused to do homage to the king for the temporalities of his see, till at length Henry found himself obliged to surrender the right of *investiture*. Thus, too, Stephen's usurpation opened the way for further encroachments; and Henry II., who found the power of Rome greatly augmented, helped to extend it further, by accepting a grant of Ireland from the pope. Then followed the opposition of Thomas-à-Becket, which arose out of the question of the punishment of ecclesiastics by the civil power. For the moment, it seemed that the quarrel was healed by the *constitutions* agreed on at Clarendon (q.v.), but it broke out more violently than ever. The pope discharged Becket from his oath, and condemned the constitutions. Becket had fled from the kingdom: and his subsequent return, murder, and canonization, all tended to strengthen the authority of the church. It was not, however, till the reign of John, when England was laid under an interdict, and the king resigned his crown to the pope, that the papal encroachments rose to their height: and the weak reign of Henry III., which followed, did nothing to abate them. Edward I. gave a check to the power of the clergy, subjected them to taxation, and passed the statute of Mortmain (1279), which prohibited

the transfer of land without the king's consent. There is little to be said as to innovations in doctrine during these three centuries; but it may be noted, that about the middle of this period, viz., 1213, the council of St. John Lateran declared transubstantiation, or the bodily presence of Christ in the consecrated elements, to be a tenet of the church.

It was in 1356 that a new period commenced. Wickliffe then published his first work, entitled *The Last Age of the Church*, directed against the covetousness of the church of Rome. His doctrines correspond in many points with those now taught by the church of England, but he differed from her in regard to the necessity of episcopacy, which he rejected; he also believed in purgatory, and enjoined prayers for the dead. His chief objects of attack were the papal indulgences, and the doctrine of transubstantiation. It has been observed concerning the condemnation at Oxford of Wickliffe's opinions with respect to the latter, that "this was the first plenary determination of the church of England in the case, so that this doctrine, which brought so many to the stake, had but with us 140 years' prescription before the times of Martin Luther." In a limited sense, he upheld the efficacy of the seven sacraments. Wickliffe had a large body of followers. They were called *Lollards*, probably from a German word, *lullen*, to sing with a low voice. The storm of persecution which he escaped by death, fell upon them. Henry IV. thought it necessary to fortify his usurped position by assisting the bishops against the Lollards; and from this time to the reformation, there was an uninterrupted succession of confessors and martyrs. Sir John Oldcastle, lord Cobham, was the most illustrious of these sufferers. Fox gives a detailed account of nearly 20 individuals burned for heresy between the death of lord Cobham and 1509, when Henry VIII. ascended the throne. To some extent, the blood of these martyrs was the seed of the Reformed church; but we must not overlook the "hidden seed" which was growing secretly, from the time that Wickliffe gave to his countrymen a translation of the Scriptures in their own tongue. The progress of learning, and especially the study of Greek, led to a better understanding of the sacred books, whilst the invention of printing (1442) caused a wider circulation of them.

The above causes, however, would probably have proved insufficient to produce the great change which was now impending, had not Henry VIII.'s divorce from Catharine of Spain led to a quarrel between him and the pope, which ended in the total abolition of the papal authority within the kingdom. Then began the REFORMATION in earnest. For the details of that great event, consult the article under that head, and the lives of such men as Wolsey, sir Thomas More, Fisher, Clement, Luther, Cromwell, Cranmer, Latimer, and Ridley, etc. From this period may be dated the existence of the church of England as a separate body, and her final separation from Rome. For the opinions of the church in Henry's reign, two important books which were then published should be consulted—viz., the *Bishop's Book*, or the *Godly and Pious Institution of a Christian Man*, and the *King's Book*, which was a republication of the same in a more perfect form in 1543, and called *The Necessary Erudition for any Christian Man*, and was called the *King's* book because put forth by royal authority. A book of *Articles devised by the Kinges Highnes Majestie to stablyshe Christen Unitie*, should also be consulted. It has been stated in the article ANGLO-CATHOLIC CHURCH, that the reformation in *doctrine* did not make much progress in Henry's reign; from these books, it will be seen that it was rather retrograde. The monks, too, who were dispossessed at the dissolution of the monasteries, were dispersed amongst local cures, and kept alive the old opinions, and the lower orders were not as yet favorable to the new doctrines. Cranmer was the leader and presiding genius of the reformed opinions; and the youth of Edward VI. left the king pliant in the hands of the archbishop. The book of Homilies, put forth in 1540, the New Communion Service and Catechism in 1548, the first Book of Common Prayer in 1549, and the Forty-two Articles in 1553, all bear the impress of his hand, and it was these which advanced and fixed the doctrines of the reformation. Nor was the temporal authority idle on the same side—Bonner and Gardiner were committed to prison, and both were deprived of their bishoprics. In fact, the way in which all the institutions of the church of England were established in Edward VI.'s reign by the help of the civil magistrate, have brought upon her the charge of Erastianism. The civil power had just delivered her from a foreign tyranny; and when the weak health of the young king, the known sentiments of his successor, Mary, the ignorance of the common people, and the interested views of the old clergy, are considered, it cannot be a matter of surprise, still less of blame, that the same arm was relied upon for the establishment of the new forms of religion.

Although Mary promised at her accession that she would put constraint on no person's religion, her promise was not kept. Bonner and Gardiner were restored; the Book of Common Prayer and Catechism were declared heretical; the kingdom was reconciled to the see of Rome; a persecution of the chief reformers commenced—Rogers was burned at Smithfield, Hooper at Gloucester, Saunders at Coventry, Taylor at Hadley. The prisons were filled with "heretics;" many fled beyond sea; some purchased safety by an outward conformity. Cranmer, Latimer, and Ridley perished in the flames at Oxford. Cardinal Pole was made primate. One benefit was conferred on the church by Mary—she surrendered all the church lands, as well as the first fruits and tenths, which had been seized by Henry. At last the death of Mary, with which that of the

cardinal was all but simultaneous, delivered the church from its oppressors. The passing of the *act of uniformity* in the first year of Elizabeth's reign, restored the common prayer-book to general use, and enjoined the same dresses as were in use at the time of the first prayer-book of Edward VI. All the bishops except one, Kitchin of Llandaff, refused to take the oath of uniformity, and were ejected from their sees to the number of 14 (the eleven remaining sees were vacant by deaths), and 175 other beneficed clergy were deprived for the same cause—no very considerable number, when it is remembered that there were then 9,400 benefices in England. There was some difficulty in filling up the vacant bishoprics, and perhaps some slight informalities. Matthew Parker was made archbishop of Canterbury. For the refutation of the fable of the NAG'S-HEAD CONSECRATION, see the article under that head. In 1562, the Thirty-nine Articles were finally reviewed and subscribed. These, with the Book of Common Prayer, are the tests of orthodoxy in the church of England.

But what was done to satisfy the scruples of Protestant non-conformists? An attempt in this direction was made in the reign of James I. at the Hampton Court conference (q.v.). The result was another review of the common prayer-book; and this, with the new translation of the Bible, and the passing of the canons of 1604, were the principal ecclesiastical events of James' reign. These canons received the sanction of the crown, but not that of parliament; they are not, therefore, binding on the laity, but they are still binding on the clergy to some extent, and they regulate the practice of the ecclesiastical courts, and are the only rule, on some points, to which the bishops and clergy can appeal. See the articles LAUD, and SCOTLAND, CHURCH OF, for the events of Charles I.'s reign. The great rebellion overthrew both church and state. The bishops were declared "delinquents," robbed of their property, and abolished; and the clergy were ejected from their benefices. Laud was put to death in 1645. The church of England had no corporate existence during this interval. With the restoration of the monarchy, 1660, came the restoration of the church. The reaction from Puritanism to Prelacy was complete. Attempts were made, but with small success, to win over the Puritan leaders; bishoprics were offered to Baxter, Calamy, and Reynolds; but the last only accepted. The Savoy conference (q.v.) was an unsuccessful, perhaps insincere attempt to comprehend the non-conformists in the established church. But the demands of the Presbyterians were most immoderate. Baxter went so far as to propose the substitution of an entirely new book of his own composition, in the place of the common prayer-book. After the failure of the Savoy conference, this was once more reviewed; and a new act of uniformity in 1662 made its use, as it now stands, compulsory in all the churches.

The church of England passed through one more critical period before reaching that tranquillity in which, for upwards of a century, she slumbered too securely. In 1687, James II. published the famous declaration of indulgence, which filled up the measure of popular discontent, and finally cost him his crown. Although by this declaration, which was perfectly illegal, liberty of conscience was permitted to all his subjects, it was clearly understood that the liberty was intended only for the papists. The nonconformists refused to accept the treacherous boon. Eighteen bishops out of twenty-five refused to publish the declaration, as ordered, in their dioceses. Seven of them—Sancroft, Lloyd, Ken, Turner, Lake, White, and Trelawny—drew up a remonstrance to the king; they were summoned before the privy council, and sent to the Tower. The whole city was in commotion; and great was the rejoicing when, on being brought to trial in Westminster hall, they were acquitted. On the 5th of Nov. following, 1688, the prince of Orange landed in England. It is worthy of remark, that out of these seven bishops three refused to swear allegiance to him, and were joined by a considerable number of the clergy; these were called Non-jurors. In the first year of William and Mary's reign, the toleration act was passed, and dissent ceased to be illegal. Another attempt was made to comprehend the nonconformists in the church, but the lower house of convocation was in no tolerant mood, and the attempt failed, but chiefly in consequence of the disturbances in Scotland. In 1717, convocation was dissolved. After slumbering for nearly 140 years, it was once more called into life and action in the province of Canterbury in 1853, under the ministry of the earl of Aberdeen, and a few years later the convocation of York also took advantage of the liberty accorded by the crown on the advice of this government. See CONVOCATION.

That the church of England, after fighting for its very existence against popery on the one hand, and against Puritanism on the other, should have subsided into inactivity during the dull reigns of the Georges, is less a matter of surprise than of regret. The peaceful enjoyment of her temporalities in a dull, irreligious, not to say infidel age, may easily account for, though it cannot excuse, her idleness. But that in the rise of John Wesley, 1730, she should have failed to see a grand opportunity for herself, is a matter of both surprise and regret; she, however, let it pass; perhaps she can hardly hope that such another will ever again present itself. The utmost that can be hoped is, that she has seen her error. The next important event in the history of the church is the act of union, which came into effect on the 1st of Jan., 1801, and united the churches of England and Ireland in all matters of doctrine, worship, and discipline. The reformation had made some progress in Ireland under Edward VI. Five Protestant bishops were appointed in 1550, and the English Bible and liturgy were introduced in 1551; but

from a variety of causes, the reformed doctrines have never found much acceptance with the native population; and although a Protestant church was established by law, it was and is the church of the minority (see IRELAND). In 1635, the English articles were received; and in 1662, the English book of common prayer was adopted by convocation. Before the political union of the countries, the two churches were in full communion. By an act of the imperial parliament in 1833, ten of the Irish bishoprics were suppressed, and the funds thus obtained were applied to the augmentation of small livings and the building and repair of churches. There are now twelve Irish bishops. But in 1869, the Irish church was disestablished and disendowed; and this branch of the Anglican community now stands in much the same relation to the church of England as does the Episcopal church in Scotland.

In later times, three great controversies have shaken the English church, which have led to some great reforms, some internal divisions, and the secession of some members to Rome, of a few to the ranks of dissent. These were the Tractarian, the Gorham, and the Essays-and-Reviews controversies. The former was occasioned by some tracts which began to be published at Oxford in 1833, the object of which was to revive something of the spirit of Catholic antiquity, and reform the abuses and slovenly practices which had crept into every part of the church system. See TRACTARIANISM. The Gorham controversy (q.v.) related to the doctrine of baptismal regeneration. The Tractarians are accused of Romanizing tendencies; and their views, when carried to extremes, undoubtedly lead in that direction, as is proved by the numerous secessions to that church. With the extreme low church party, episcopacy is rather an expedient than a necessary form of church government. They think but little of the efficacy of sacraments, and deny that regeneration necessarily takes place in infant baptism. Justification by faith, the atonement of the cross, and the Calvinistic doctrines on election, are their leading topics in preaching. See the lives of SIMEON and of VENN for the views of this party.

The Essays-and-Reviews controversy (so called from a book thus named) concerned what are called BROAD CHURCH views, which are attributed to men of the Arnold school, and the followers of Mr. Maurice (q.v.). Those who hold them can scarcely be called a party, and are, indeed, unwilling to be so considered; but if their position must be defined, they might be described as a party between, and somewhat antagonistic to, both the high and low church parties. The high church party insist on the authority of the church and priesthood, the efficacy of sacraments when rightly received, and the necessity of apostolical succession in the matter of orders, and in their general teaching they take the prayer-book as the exponent of Scripture. They are scrupulous in observing the rubrics, and have done much to revive the practice of daily prayer in the churches, and the observance of the festivals. Order, unity, antiquity, and catholicity are what they profess to have in view. See RITUALISM.

There are at present, in round numbers, 13,000 benefices in England and Wales, of which a large number are new districts, which are being continually formed out of the old large and overpopulous parishes. These districts are called perpetual curacies, or incumbencies, and for the most part are but very slenderly endowed. The old benefices are either rectories, where the incumbent receives the *great* or corn tithes, or vicarages, where he receives the small tithe only. The great tithes had anciently been bestowed upon the neighboring monasteries, who undertook the cure of the souls and appointed vicars for the purpose, who lived on the small tithes and the offerings of the people. At the dissolution of the monasteries, many of the great tithes were given to laymen, and laymen now extensively hold them, and some to endowed colleges. The endowments were all by private beneficence, and there is no tenure so ancient as that by which the parish church holds her property. The aggregate amount was ascertained by the commission appointed in 1830 to be as follows: Bishops, £181,631; deans and chapters, £360,095; parochial clergy, £3,251,159; total annual revenue, £3,792,885. The value of the property of the Irish church was in 1869 estimated by Mr. Gladstone at £16,000,000. The church rates, amounting to £500,000 annually, were no part of the minister's endowment; they were exclusively devoted to the repairs of the church fabric, and the warming, lighting, cleaning, etc., of the church; and were under the exclusive control of the church-wardens. Of these there are two in each parish, one generally nominated by the minister, the other elected by the parishioners. The payment of church rates is no longer compulsory.

The church of England has three orders of clergy—bishops, priests, and deacons. Generally, a degree at one of the English universities, or of Dublin, is required in a candidate for orders; but in Wales and some of the more populous districts, this condition is dispensed with. There are two archbishops (Canterbury and York) and 28 bishops in England; besides 2 archbishops and 10 bishops in Ireland. The archdeacons and rural deans assist the bishops in the management of their dioceses. The deans and canons rule the cathedrals with but slight power of interference on the part of the bishops.

The patronage of the church is in a great variety of hands—in the crown, the bishops, the nobles, and the gentry, and incorporate bodies such as colleges and cathedrals. Advowsons and next presentations may be sold as property, but a presentation may not be sold when a living is vacant. A clergyman is "presented" to his living by the

patron; he is admitted and inducted by the bishop or his appointee; he must "read himself in," i.e., he must read the Thirty-nine Articles after the morning or evening prayer within two months after induction. The bishop may refuse institution on the ground of false doctrine or immorality; but an appeal lies to the Arches court and the head court of appeal.

The Episcopal church in Scotland is not, politically speaking, in union with that of England. But an act of parliament, passed in 1864, has taken away many restrictions imposed on Scottish Episcopalians after the battle of Culloden; and clergy ordained by Scotch bishops may now, under some slight restrictions, be presented to benefices in England. Events connected with the colonies have also drawn these two communions into closer alliance; and some bishops, selected by English authorities for foreign parts, have been consecrated in Scotland.

The above sketch has been largely drawn from Short's excellent *History of the Church of England;* see also Marsden's able *Dictionary of Christian Churches and Sects*, and Hardwick; also Fuller's *Church History*, Collier, Strype, Mosheim, Burnet, and Clarendon. Among the great divines whose works should be consulted for further information regarding the views of the church, may be named Barrow, Pearson, Hooker, Jeremy Taylor, Lightfoot, Hammond, Sancroft, South, Tillotson, bishop Butler, Atterbury, Bull, Sherlock, and others.

ENGLAND, JOHN, D.D., 1786–1842; b. Ireland, educated at Carlow college, and took orders in the Roman Catholic church. In 1820, he was appointed bishop of Charleston, S. C., where he founded the *Catholic Miscellany*, the first publication of that church in the United States. He was a learned and zealous prelate, efficient in his office, but kindly disposed towards those of other communions, and was held in general esteem.

ENGLAND, NEW. See NEW ENGLAND.

ENGLANTÉ, in heraldry, is bearing acorns or other similar glands.

ENGLE, FREDERICK, 1799–1868; b. Penn.; midshipman in 1814, rising to rear-admiral in 1866, when he was retired. He served with distinction in the Mexican war and in the war of the rebellion.

EN'GLESHERY, EN'GLESBURY, i.e., being an Englishman. The presentment of Engleshery is thus explained, Hale's *Pl. of Crown*, p. 446: "Anciently, there was a law introduced by Canutus the Dane, that if any man were slain in the fields, and the manslayer were unknown, and could not be taken, the township where he was slain should be amerced to 66 marks; and if it were not sufficient to pay it, the 100 should be charged, unless it could be made appear before the coroner, upon the view of the body, that the party slain was an *Englishman;* and this making it appear was various according to the custom of several places, but most ordinarily it was by the testimony of two males of the part of the father of him that was slain, and by two females of the part of his mother." William the conqueror continued this law. Presentment of E. was taken away 21 Edw. III. st. 1. c. 4.

EN'GLEWOOD, a village and township in Bergen co., N. J., 14 m. n. of New York, on the New Jersey Northern railroad, near the palisades. It is occupied chiefly by the families of men who do business in New York; has good hotels, several churches, and a classical institute. It is noted for fine scenery and cultivated society.

ENGLISH, forms the first part of several geographical names.—1. English cove is a bay of the Pacific ocean, on the s.w. coast of New Ireland, in lat. 4° 54′ s., and long. 152° 35′ east.—2. English harbor, on the s. coast of Antigua, is one of the best havens in the West Indies. It is situated in lat. 17° 3′ n., and long. 61° 45′ west.—3. English harbor is on the Pacific shore of Costa Rica, in Central America, lying in lat. 8° 50′ n., and long. 83° 55′ west.—4. English river is an estuary on the w. side of Delagoa bay, an inlet of the Indian ocean, in Africa. It is about lat. 25° 58′ s., and long. 32° 36′ east.—5. English river, otherwise known as Mississippi or Great Water, enters Hudson's bay from the w., at fort Churchill, about lat. 59° n., and long. 94° w., after an estimated course of 630 miles.

ENGLISH, GEORGE BETHUNE, 1787–1828; b. Mass.; graduated at Harvard, and was a member of the Boston bar, but finally studied divinity. He published *The Grounds of Christianity Examined*, a work favoring Jewish views. After editing a paper in the west, he became a lieut. of marines, and went on service in the Mediterranean, resigned his commission, became a Mohammedan, joined the army of Ismail Pasha in 1820, and served in the artillery in the expedition against Sennaar. He was subsequently agent for the United States government in the Levant, returning home in 1827. He published *Narrative of the Expedition to Dongola and Sennaar.*

ENGLISH, THOMAS DUNN, b. Philadelphia, 1819; studied medicine and law, but soon devoted his whole attention to literature, editing newspapers and magazines, and writing novels, dramas, poems, etc. His song of *Ben Bolt* is widely known. Of late years he has been practicing as a physician, though still a frequent contributor to current literature.

ENGLISH, WILLIAM H., b. Ind., 1822. He studied law, and in 1843 was chosen clerk of the Indiana house of representatives. In 1851, he was made speaker of the

legislature, and in 1852 was elected to congress, holding his seat till 1860, when he retired from active political life. His chief title to distinction, however, is his nomination for vice-president of the United States by the democratic national convention at Cincinnati, June, 1880.

ENGLISH or BRITISH **CHANNEL** (*La Manche* or the *Sleeve* of the French, and the *Oceanus Britannicus* of the Romans) is the narrow sea which separates England and France, having on the n. the English counties of Kent, Sussex, Hants, Dorset, Devon, and Cornwall; and on the s. the French provinces of Artois, Picardy, Normandy, and Bretagne. On the e., it joins the North sea, at the strait of Dover, where it is narrowest, being only 21 m. wide from Dover to cape Grisnez. From this strait it runs w.s.w. for 280 m., and joins the Atlantic ocean at the Chops, with a breadth of 100 m. between the Scilly isles and Ushant isle. With an average breadth of 70 m., it is 90 m. wide from Brighton to Havre; 60 m. from Portland Point to cape La Hague; 140 m.—its greatest breadth—from Sidmouth to St. Malo; and 100 to 110 m. w. of the latter line. It occupies 23,900 sq. geographical m., and includes the Scilly isles, Channel isles, Ushant isle, isle of Wight, and many islets and rocks, especially off the coast of Bretagne. It is shallowest at the strait of Dover, where a chalk-ridge at the depth of 12 to 30 fathoms joins England and France. W. of this, it deepens to 60 fathoms, with some banks at 3 to 5 fathoms, and some hollows 5 to 30 fathoms deeper than the parts around. A coarse gravel covers the bottom. The English coast-line of the E. C. is 390 m. long, with an inshore depth of 12 to 55 fathoms, and the French coast-line of the E. C. is 570 m. long. Westerly winds prevail in the E. C., and the current, though imperceptible, is always from w. to east. The E. C. abounds in fish, of which the chief are pilchard, mackerel, and oysters.

ENGLISH CONSTITUTION. See PARLIAMENT.

ENGLISH DRAMA. See DRAMA.

ENGLISH LANGUAGE, which is now spoken by nearly 80 millions of the earth's inhabitants, is in its vocabulary one of the most heterogeneous that ever existed; a fact, the causes of which are to be traced in the history of England (q.v.). Its composition and grammatical character are thus described by M. Müller in his *Lectures on the Science of Language* (1861). "There is, perhaps, no language so full of words evidently derived from the most distant sources as English. Every country of the globe seems to have brought some of its verbal manufactures to the intellectual market of England. Latin, Greek, Hebrew, Celtic, Saxon, Danish, French, Spanish, Italian, German—nay, even Hindustani, Malay, and Chinese words—lie mixed together in the English dictionary. On the evidence of words alone, it would be impossible to classify English with any other of the established stocks and stems of human speech. Leaving out of consideration the smaller ingredients, we find, on comparing the Teutonic with the Latin, or Neo-Latin, or Norman elements in English, that the latter have a decided majority over the home-grown Saxon terms. . . . M. Thomerel, who counted every word in the dictionaries of Robertson and Webster, has established the fact, that the number of Teutonic or Saxon words in English amounts to only 13,230 against 29,853 words which can either mediately or immediately be traced to a Latin source. On the evidence of its dictionary, therefore, and treating English as a mixed language, it would have to be classified together with French, Italian, and Spanish as one of the Romance or Neo-Latin dialects. Languages, however, though mixed in their dictionary, can never be mixed in their grammar. . . . We may form whole sentences in English consisting entirely of Latin or Romance words; yet whatever there is left of grammar in English bears unmistakable traces of Teutonic workmanship. What may now be called grammar in English, is little more than the terminations of the genitive singular and nominative plural of nouns, the degrees of comparison, and a few of the persons and tenses of the verb. Yet the single *s*, used as the exponent of the third person singular of the indicative present, is irrefragable evidence that in a scientific classification of languages, English, though it did not retain a single word of Saxon origin, would have to be classed as Saxon, and as a branch of the great Teutonic stem of the Aryan family of speech." See LANGUAGE.

In tracing the growth of the E. L., the history is usually divided into *four* leading periods: the *Anglo-Saxon period* (440 A.D. to 1066 A.D.); the *Semi-Saxon period* (from 1066 A.D. to 1250 A.D.); the *Early English period*, comprising the two periods of *old* and *middle English* (from 1250 A.D. to 1550 A.D.); and the *Modern English period* (from 1550 A.D. to the present time). But this nomenclature and these divisions are now impugned by an increasing number of scholars, who affirm, not without reason, that English was always English, and never "Anglo-Saxon;" that the fact of its being inflected in the period before the Norman conquest, and losing most of its inflections in later times, is no reason at all for speaking of it as if it were two or even three different languages, and that we have no warrant in the usage of the inflected period for calling our forefathers or their speech anything but English. It is certainly very misleading to name the period immediately succeeding the conquest *Semi-Saxon*, because it induces people to imagine that the so-called "Saxon," that is, the English, element of our language had begun to be mixed up with foreign ingredients, though, in point of fact, its two great monuments, *The Chronicle*, and Layamon's *Brut*, are all but absolutely free from such. It is proba-

ble, therefore, that the old divisions and their designations will before long be abandoned, and they are only retained here out of respect to a usage which has penetrated modern English literature.

As early as the 5th c., Teutonic invaders from the continent settled in this country, and drove the original Celtic-speaking inhabitants to the n. and w. of the island; so that before the battle of Hastings (1066), the tongue of the conquerors had been spoken in England for at least 600 years. The final absorption, after numerous conflicts, by the kings of Wessex, or West Saxons, of the various states of the "Heptarchy;" in the 9th c., went far to make the ruling speech of the land identical with that of Berkshire and Hants, the recognized center of the predominant sept. The use, besides, of this southern Anglo-Teuton speech as the chief instrument of literary communication, was permanently confirmed by the influence of king Alfred, a native of Berks. Further back than the time of this literary monarch, few existing remains of the language permit us to go; yet, from the writings of Cædmon, who was a North Anglian, and a few ecclesiastical MSS. of the kingdom of Northumbria, which extended from the Humber to the firth of Forth, it has been generally concluded that at least two dialects must have been used in the island—a northern and a southern one. The Anglian or northern dialect was, to some slight extent, marked by Scandinavian features; while the Saxon or southern dialect was more purely Low-Germanic, though the Anglian was also Low-German in all essentials. Some have accounted for the partial approximation of the Anglian dialect to Scandinavian by the fact that the Danes, at a later period, effected a settlement in the n.e. of England; but on the other hand, it is argued that "certain peculiarities of a Scandinavian character are to be found in the Anglian, even of a date anterior to the first Danish occupation of a part of England in the latter half of the 9th century." Nor would this be at all surprising if we admit that the Angles came from that corner of Slesvig still called "Angeln," or indeed from any region n. of the Elbe. Some philologers, again, insist on distributing the Anglo-Saxon language into more dialects than two; but it will be sufficient if the reader bear in mind the two which have been mentioned. It is important to notice here that neither the Anglian nor the Saxon borrowed almost anything from the language of the conquered Britons; in other words, English is very nearly free of any Celtic element. On the other hand, a considerable, but not large, number of Latin words found their way into the English vocabulary before the Norman conquest, through the introduction of Latin Christianity, and the translation of Latin authors into English.

The period in the history of our English tongue incorrectly described as *Semi-Saxon* because the inflections that marked the earlier stage then began to give way, dates from a generation after the conquest until near the middle of the 13th century. Like every transition era, it was a period of confusion, both to those using the language, and to those desirous of tracing its history. The monks of the time, accustomed to the use of mediæval Latin, had in a great measure forgotten the grammar of their native language; and when they attempted to write it, did so very badly. The *Chronicle*, which in its latest form comes down to 1154, and Layamon's *Brut*, written about 1190 or 1200, exhibit traces ot the breaking up of the grammar. The inflections and genders of the substantives, the definite and indefinite declensions of adjectives, are for the most part disregarded; a marked partiality is showed for weak preterits and participles; there is a constant substitution of *en* for *on* in the plurals of verbs; and the final *e* is often discarded; besides a great uncertainty prevailing in the government of prepositions. As regards the vocabulary itself, although employed in literature a century and a half after the Norman conquest, it exhibits, as already noticed, but few traces of Norman-French (only 90 words in 57,000 verses); proving beyond question that the immediate effects of that great change were by no means so important on the English tongue as they were at one time believed to be.

When we come to the *third* period in the history of English, commonly called *early English*, we have escaped most of the perplexities which attach themselves to the previous stage of our language. The tendency of the language to substitute an *analytical* for a *synthetical* structure is now seen vigorously at work. The "Anglo-Saxon" was tolerably rich in inflections, which are now largely got rid of. The various modifications of an idea are expressed by some relational word or words attached to the leading idea. During the second or semi-inflected period, the verbs suffered much less inflectional change than the substantives and adjectives; this will be found to hold throughout the entire 250 years of the era of reconstruction. In the fine poem of *The Owl and the Nightingale*, the Anglo-Saxon vowels *a*, *e*, *u*, in final syllables, are all represented by *e*, and the final *n* of the infinitive is beginning to disappear. In the chronicle of Robert of Gloucester we encounter, besides, a great number of French words (Dr. Marsh found 4 per cent in 10 pages), which had gradually become familiar to the people, through the presence of their Norman masters, and through the efforts of the latter to speak English after it was found impossible to supplant it by Norman French. The presence of French is, besides, very noticeable in the poetry of Chaucer and Gower; but there is no ground for the statement that these writers corrupted the language by a large admixture of novel French words. Dr. Morris is quite correct when he says (introduction to Chaucer's *Prologue*, etc., Clarendon press series), that Chaucer, "with few exceptions, employed only such terms as were in use in the *spoken* language, and stamped them

with the impress of his genius, so that they became current coin of the literary realm." And Mr. Skeat remarks (introduction to *Piers the Plowman*, same series), that "Langland does the very same thing, employing Norman-French words freely whenever he wishes to do so." As to Scotland, again, in the Anglian counties lying south of the Forth, and as far north of it as English had got a footing, the language also underwent such changes as we have noted in the more southern dialects. Barbour, a Scottish contemporary of Chaucer, wrote purer English than Chaucer did, only because he used less French. Regarding the north-eastern dialects of Scotland, indeed, some diversity of opinion exists. Some antiquaries are of opinion that the large infusion of Norse or Scandinavian elements in these dialects is to be accounted for by the fact of a Norwegian kingdom having been maintained there more or less from the 9th to the 11th c.; while others allege that the language of the n.e. of Scotland is in substance and grammar as decidedly Anglian as that of Norfolk or Yorkshire.

We may here notice the question which has often been asked: Which of the early dialects spoken in England is the origin of the form now used? We have seen that in the pre-Norman period *two* were employed for literary purposes, a northern or Anglian, and a southern or Saxon, the latter of which, through political causes, was perhaps considered the more classical of the two. In the period, however, succeeding the Norman conquest, and more especially after 1250, we find not *two*, but *three* dialects; a northern, a midland, and a southern. The cause of this was probably the breaking up of the supremacy of Wessex after the battle of Hastings. Circumstances now gave prominence to the midland counties, in which arose the great universities, the rich monasteries, and many other religious foundations. One of its subdivisions, the east midland, was the dialect in which Orm, Robert of Brunne, Wickliffe, Gower, and, above all, Chaucer wrote. It had then become the speech of the metropolis, and had probably forced its way south of the Thames into Kent and Surrey. This, therefore, may be considered the immediate parent of modern English, but inasmuch as the midland gathered into itself from its very position many of the peculiarities of the dialects spoken north and south of it, sir Frederick Madden's view (Layamon's *Brut*, 1851), that we must look for the real groundwork of modern English in a gradual coalescence of the various dialects, may still be considered substantially correct.

ENGLISH LITERATURE, like every other mental product, is qualified by the history of the nation to which it belongs. The great social eras of a country's history have always been found to correspond with the great intellectual eras of her growth. It will, however, be sufficient for our purpose to arrange the literary annals of England into three periods: 1. The period antecedent to the Norman conquest; 2. The period extending from the Norman conquest to the English reformation; and 3. The period extending from the English reformation to the present day.

1. *The Period antecedent to the Conquest.*—This period possesses a literature composed in three distinct languages—the *Celtic*, the *Latin*, and the *English*. Regarding the Celtic literature, see CELTIC NATION, IRISH LITERATURE, and WELSH LITERATURE. The introduction of Latin literature into this country was considerably later than the Roman invasion of it. The cultivation of the letters of Rome followed as a necessary consequence on the introduction of Christianity into the country. Towards the close of the 6th c., St. Augustine landed in the south of England, and laid the foundations of the Anglo-Catholic church. These great evangelists, however, rather prepared the way for literary effort on the part of others, than were themselves literary. The earliest names that we encounter are Gildas, Nennius, Bede, Alcuin, Asser, and Erigena. After the immigration of the Angles and Saxons into Britain, this people began to form a literature of their own. Their three historical poems—*The Gleeman's Song*, *The Battle of Finnesburgh*, and *The Tale of Beowulf* (q.v.)—are mainly versions of events which happened on the continent before the descent on the shores of England. Except the remarkable religious poems of the Northumbrian monk Cædmon, in the 7th c., little more of any moment in verse has been handed down to us by the English people who lived before the conquest. But this people, though comparatively poor in poetry, are eminently simple and straightforward prose writers. King Alfred discarded Latin in all his communications with his subjects, and in consequence the native language made an impressive start throughout the whole of England. From the *Chronicle*, which is made up from the MS. of several conventual records, modern scholars have derived special and valuable information. Portions of the sacred Scriptures were translated into English, several of the leading men of the time, such as Aldhelm, Bede, and Alfred, lending their assistance. Sermons and grammars, glossaries and medical treatises, geographies and dialogues between Solomon and Saturn, make up the file of this period of the literature.

2. *The Period extending from the Norman Conquest to the English Reformation.*—The conquest had the effect of changing the language of the court, the schools, and the tribunals of justice; it took but little effect on the native inhabitants. In a few centuries, owing partly to the obstinacy with which the English people clung to their mother-tongue, and partly to the circumstance that long settlement in England and political antagonism to France had practically changed the descendants of the Norman conquerors into English nobles, and inspired them with English feelings, the latter began to

abandon the use of French. "In 1349, boys ceased to learn their Latin through the medium of this tongue; and in 1362 (the 36th year of Edward III.), it was directed by act of parliament that all pleadings in the law-courts should henceforth be conducted in English, because, as is stated in the preamble to the act, French was become much unknown in the realm" (Morris's *Historical Outlines of English Accidence*, 1872). In a generation or two after the conquest, classical and theological learning made very considerable progress. Monasteries were busy, and the English universities were both by this time founded; while an interchange of teachers and pupils constantly went on between the English seminaries and those of France and other countries. Lanfranc and Anselm, Hales and Duns Scotus, Michael Scot and Roger Bacon, had attained to a great eminence in speculative and in physical philosophy. Doubtless their thinking was more characterized by its hair-splitting ingenuity than by its solidity, but the 12th and 13th centuries stand out in a distinguished manner in England, and indeed throughout Europe, for their peculiar devotion to speculative studies. But all these philosophers wrote in Latin, as did the historical writers of the same period, of whom the chief were William of Malmesbury, Geoffrey of Monmouth, Giraldus Cambrensis, and Matthew Paris. A literary feature of the age which must not be overlooked was the frequency of satire expressed in rhymed Latin verse. The most notable of the mediæval satirists was Walter Mapes, to whom is ascribed (though the evidence of his authorship is not conclusive) certain clever half-scurrilous poems, from one of which, the *Confessio Goliæ*, have been extracted a number of verses, commonly but erroneously spoken of as a "drinking-song" (see MAPES). The satire passed from the clergy, and was directed against the feeble king (John). De Montfort and the other great barons who distinguished themselves at Runnymede, are the theme of popular praise. In the same Latin tongue was composed the oldest legendary work of the middle ages. The *Gesta Romanorum* (q. v.) is a compilation of uncertain origin. The stories themselves are in many cases of great antiquity, and in their earliest forms can be traced to the distant east. In their Latin dress they were the property, not of England only, but of all western Christendom, and their only claim to notice in a special survey of E. L. arises from the fact that their editor, Elinandus, was perhaps an Englishman, and that they have furnished (at second or third hand) incidents and plots to the genius of Shakespeare and Scott. In the same relation to E. L. stands *The Seven Wise Masters*, traceable back to India, but known to all western Europe in a Latin form, and to England in particular under the title of the *Process of the Sevyn Sages*. The French Fabliaux affected our literature but little before the time of Chaucer. On the other hand, the romances of chivalry, rude and spirited, pathetic and imaginative, are well worth the attention of the student of English literature. The best of these, first written in French, but afterwards translated into English, celebrate the glory and fall of king Arthur and his knights of the Round Table, of which splendid use has recently been made by Alfred Tennyson in his *Idyls of the King*.

Meanwhile the English tongue was undergoing those serious grammatical and phonetic changes to which reference has already been made. During this half-chaotic stage it was scarcely fit to be a vehicle of literary expression, even if the ignorance and helplessness of the conquered people had not of themselves been sufficient to prevent the growth of a vernacular literature. The first indication of reviving life is the appearance of Layamon's *Brut* (see LAYAMON) about the close of the 12th century. The next century is comparatively rich in writers who use the English tongue, and whose works, if not masterpieces of artistic skill, are at least invaluable for linguistic purposes. The most important of these writers are Orm, Guildford, and Robert of Gloucester.

The period of what is called *Early English, embracing the 14th and 15th centuries*, is one of great importance, both in the progress of English history and of English literature. The translation (the first ever executed) of the Bible into English, which was completed by Wickliffe about 1380, is a work of great value, not only as a monument in the religious history of our nation, but in a philological point of view, being, as it is, all but first among the prose-writings in that form of the English tongue which is now in use. The principal book which precedes it, and the very oldest written in "early English," is sir John Mandeville's account of his eastern travels (1356). Somewhat later (between 1390 and 1400), Geoffrey Chaucer, the genuine father of English poetry, published his *Canterbury Tales*. A shrewd and sagacious observer, he has left behind him in these *Tales* a series of sportive and pathetic narratives, told with such a wonderful power of tenderness and humor, in such a simple, healthy style (although his vocabulary is largely modified by French, and is by no means a "well of English undefiled"), that they have been the wonder and delight of all succeeding times. Laurence Minot, Richard Rolle, Langland, author of *Piers the Plowman*, and Gower, fitly close round Chaucer as contemporaries who wrote more or less vigorous verse. About the same period flourished in Scotland John Barbour, whose epic narrative, *The Brus*, written about 1376, is incomparably the greatest of all the metrical chronicles. In the following century (the 15th), and in the early part of the 16th, occur in England the names of John Lydgate (1430), whose *London Lyckpeny* is still agreeable reading; Alexander Barclay, whose *Ship of Fools* was printed in 1509; John Skelton, author of the scurrilous satires of *Colin Clout* and *Why Come ye not to Court?* (died 1529); Howard, earl of Surrey (beheaded 1546–47), who wrote the first sonnets and the first blank verse in the English tongue; and sir Thomas Wyatt (died 1541). The prose writers of this period are sir John

Fortescue, chief-justice of the king's bench under Henry VI., who flourished 1430–70, and who wrote, among other things, a tract on the *Difference between an Absolute and Limited Monarchy, as it more particularly regards the English Constitution;* William Caxton, who introduced printing into Britain in 1477—the first book ever printed in this country being a translation of the French work *Le Recueil des Histoires de Troye;* sir Thomas Malory, whose *Morte Darthur* (1469–70) is the final form of the Arthurian romance; Hall, an English lawyer (died 1547), who wrote a chronicle of the *Wars of the Roses;* and Tyndale, burned (1536) for heresy. In Scotland, during the same period, we encounter in poetry the names of James I., king of Scotland (murdered 1437), author of the *King's Quhair*, etc.; Andrew Wyntoun, prior of Lochleven, whose *Oryginale Cronykil of Scotland* was completed about 1420; Blind Harry, author of *The Adventures of William Wallace*, a work written about 1460, and long exceedingly popular with the Scottish peasantry; Robert Henryson (died *circa* 1500), author of *The Testament of Cresseid*, etc.; William Dunbar (died about 1520), whose *Dance of the Seven Deadly Sins* shows him to have possessed great boldness and vigor in his delineations of character; and Gavin Douglas (died 1522), whose best work is a translation of Virgil's *Æneid* into English verse—at least into what both Scotchmen and Englishmen then reckoned English verse.

3. *The Period extending from the English Reformation to the Present Day.*—Among the brilliant works of the Elizabethan age, there is probably none of which we may not detect germs in some of the efforts which were made in the century that preceded. In theology, the names of Latimer (burned 1555), of Cranmer (burned 1556), and of Ridley (burned 1555), shine forth conspicuously; and it is sufficient to mention sir Thomas More (beheaded 1535), author of *Utopia*, a curious philosophical work, and Roger Ascham (died 1568), as excellent miscellaneous writers of that time. The last-mentioned, indeed, exercised no inconsiderable influence on the development of the English tongue, and his *Schoolmaster* is a work that is even yet influential. We may here mention the Scotchmen, Mair or Major, sir David Lyndsay, Boece, Melville, and, above all, George Buchanan, who is universally admitted to have been one of the finest classical scholars that ever appeared in Christendom.

The origin of the English drama is discussed in the articles DRAMA and MYSTERIES AND MIRACLE PLAYS. It is therefore only necessary here to note that the first English comedy, *Ralph Roister Doister*, was written by Nicholas Udall about 1552–53, and the first English tragedy, *Gorboduc*, or *Ferrex and Porrex*, by Sackville and Norton a few years later. The era on which we are next to look, the Elizabethan, is the most brilliant in the literary history of England. We may quote here the words of lord Jeffrey: "In point of real force and originality of genius, neither the age of Pericles, nor the age of Augustus, nor the times of Leo X. or of Louis XIV., can come at all into comparison. For in that short period we shall find the names of almost all the great men that this nation has ever produced; the names of Shakespeare, and Bacon, and Spenser, and Sidney; of Raleigh, and Hooker, and Taylor; of Napier, and Milton, and Cudworth, and Hobbes; and many others—men, all of them not merely of great talents and accomplishments, but of vast compass and reach of understanding, and of minds truly creative; not men who perfected art by the delicacy of their taste, or digested knowledge by the justness of their reasonings; but men who made vast and substantial additions to the materials upon which taste and reason must hereafter be employed, and who enlarged to an incredible and unparalleled extent both the stores and the resources of the human faculties." Even the minor dramatists of the time, such as Marlowe and Chapman, Beaumont and Fletcher, Jonson and Drummond, are all nearly the equals of any succeeding poets that have appeared. In the latter half of this period a new class of poetic writers started up, who were lyrical rather than dramatic, and whose occasional verses, sometimes descriptive, sometimes amatory, and sometimes religious, are characterized by a bright and delicate fancy, as if morning sunbeams glittered on their pages. These are George Wither, William Browne, Francis Quarles, and George Herbert, "the sweet psalmist of the 17th c." (as Emerson calls him). The last forty years of the 17th c. are generally known as the age of the restoration and the revolution. During this period, the literature of the stage was disgraced by its indecency. Charles II. and his court had brought back with them from France a love of polite profligacy, which found its most fitting expression in the comedy of intrigue. Four names stand out conspicuous as "sinners above all men in that generation"—Wycherly, Congreve, Vanbrugh, and Farquhar. Yet theology could boast of such names as Baxter, Owen, Calamy, Collier, Leighton, South, Tillotson, and Barrow. This was also the epoch when the great Milton, driven into the shades of obscurity by political adversities, fulfilled the uttered hope of his youth, and wrote "something which posterity will not willingly let die." About this time, too, Walton angled, and Butler burlesqued dissent; Marvell turned his keen irony against the high church; Locke and Newton speculated and discovered; and John Dryden, the literary chief of the time, "found the English language," according to Dr. Johnson, "of brick, and left it of marble."

The literary history of the 18th c., and of the reign of queen Anne, has been variously estimated. "If it was overvalued," says prof. Spalding, "by those who lived in it, and in the age that succeeded, it has assuredly been undervalued in our own day. It was long glorified as the Augustan age of English literature; but among ourselves it has been set aside as a skeptical, utilitarian age, when poetry could find no higher field

than didactic discussion, and prose found nothing to amuse but comic and domestic narrative, or bitter and stinging satire. The truth, as usual, lies in the middle. This age was far from being superior to every era that had gone before it, and it was not quite so low as some of its hostile critics have represented. One thing, however, is beyond dispute, viz., that the *form*, both in poetry and in prose, had come to be much more regarded than the *matter*. Addison, Swift, and Johnson may be taken as types of the prose writers of this century. The first, for ease and grace, is unmatched in any age; the second stands equally high for rough and pointed vigor; and the third is famous for his ponderous, finely balanced sentences, the dignity of which not unfrequently surpassed the sense. Defoe created no school, but the author of *Robinson Crusoe* will live for ever. The poetry of the time is represented by Pope, and it has been gravely asked whether he was a poet at all. He certainly versified with brilliant elegance, and the terror which his polished epigrams excited in the breasts of his enemies, showed him to possess a force of genius which at least demands our admiration. Young and Akenside were perhaps animated by a higher poetic sense, but they accomplished much less; and the same may also be said of Thomson, Gray, Collins, Beattie, and Cowper. Incomparably the greatest poet, however, of the 18th c. was Robert Burns, though he wrote in a dialect of English that has since become a *patois*, and even then, though used by a nation, was not the recognized standard of literary expression. Richardson, Fielding, Smollett, Sterne, Goldsmith, and Mackenzie are its novelists; Hume, Robertson, and Gibbon, its historians; Butler, Berkeley, Clarke, Shaftesbury, Hume, Paley, and Adam Smith its philosophers.

The 19th c., though full of interest for us, is, from the novelty and the variety of the intellectual character employed in it, one of the most difficult to analyze of the whole range of English literature. It has been a time of extraordinary activity; books have been multiplied to an unprecedented degree, and readers have increased in an equal proportion. It cannot be doubted, however, that the first quarter of this century is greater in *pure* literature than any subsequent portion of it. It is greater, besides, in poetry than in prose. The early names of Coleridge and Wordsworth, of Scott and Byron, of Shelley and Keats, of Campbell and Southey, are higher than any now prominent except that of Tennyson and perhaps Browning. The 19th c. is the age of novels and romances, of reviews and periodicals. Jeffrey and Sydney Smith, Hazlitt and John Foster, De Quincey and Carlyle, are the great names in review-literature: Hall, Chalmers, Irving, and Liddon in pulpit oratory; Stewart, Mackintosh, Bentham, Brown, Hamilton, Ferrier, Mill, Herbert Spencer, and Bain in philosophy; Dickens, Thackeray, Bulwer Lytton, Miss Bronte, and Miss Evans, as novelists; Hallam, Macaulay, Thirlwall, Grote, Milman, Carlyle, Froude, and Freeman, as historians; Ruskin, as a writer on art; Tennyson, the Brownings, Matthew and Edwin Arnold, Dobell, Smith, and Swinburne, as poets; and in the new world beyond the Atlantic, Washington Irving, Poe, Longfellow, Bryant, Cooper, Prescott, Emerson, Bancroft, Holmes, Hawthorne, and Bret Harte, with many more, rise before the mind when one tries to seize upon the great living authors of this age or those recently dead. A considerable portion of the literature of the 18th and 19th centuries is devoted to science, which can show a crowd of illustrious names too numerous to mention. Besides, in scientific works, the *matter* is of so much greater importance, and so much more attended to than the *form*, that it is not customary to include scientific writers in a survey of literature proper, though Tyndall and Huxley might well be named in any catalogue of English authors who write English with beauty and force.—See Chambers' *Cyclopædia of English Literature;* Taine's *English Literature*, translated by Van Laun.

ENGLISH PALE, or IRISH PALE, or THE PALE, a portion of Ireland brought under English rule before the complete subjugation of the whole island, corresponding nearly with the present province of Leinster, with the counties of Cork, Kerry, Waterford, Limerick, and Tipperary; but the boundaries varied at different times.

ENGRAFTING. See GRAFTING, *ante.*

ENGRAIL'ED, in heraldry, a line composed of a series of little half-moons, or semicircles, supposed to have been made in it by hail. E. is the opposite of invected.

ENGRAVING, in its widest sense, is the art of incising designs, writing, etc., on any hard substance, such as stone, metal, or wood. Many branches of the art are of great antiquity; such as gem-engraving, cameo-cutting, and die-sinking. The more important of these ornamental and useful kinds of E. are described under their proper heads. But in a narrower sense, E. is the special designation of the art of cutting or indenting the surface of metal plates or of blocks of wood with designs, for the purpose of taking off impressions or *prints* of the designs on paper. This department of the art arose as late as the 15th c., the earliest wood-engraving with a date being 1423, and the earliest dated E. from a metal plate being 1461.

Wood-engraving differs from E. on metal in this, that on a metal plate the traces or marks which are to appear on the paper are cut or sunk into the plate, and when printed from are filled with ink, while the rest of the surface is kept clean; whereas in wood-engraving they are left prominent or in relief, and the blank parts of the design are cut away. Hence a wood-cut acts as a *type*, and is inked and printed from in the usual way. See PRINTING. This makes wood-engraving peculiarly suitable for the illustration of

books; as the blocks can be printed from along with the letterpress; while the impressions from a metal plate must be taken by themselves, and by a slow process. The further treatment of the important art of wood-engraving is reserved for a separate article; our attention at present being confined to E. on metal.

It is beyond our scope to enter into the practical details of the various processes; we can only aim at enabling a reader altogether ignorant of them to conceive how the effects may be produced, and to understand the terms currently used in speaking of this kind of art.

The metals most commonly used for E. are copper and steel, the former having the advantage of being more easily worked, the latter of greater durability. The processes of working are essentially the same in both. The several manners or styles of E. are distinguished as line-engraving, mezzotinto, stippling, and aquatinta.

1. *Line-engraving*—in which, as the name implies, the effect is produced by a combination of lines—is executed either by direct incision with the graver or the dry-point, or by a combination of incision with *etching*—a chemical process to be immediately described. The *graver* or *burin* is usually in the form of a quadrangular prism, fitted into a short handle. In making the incision, the graver is pushed forward in the direction of the line required, being held by the handle, at an angle very slightly inclined to the plane of the copper. A *scraper* is required to scrape off the barb or burr which is formed by the action of the graver and dry-point. The *rubber* is a roll of cloth dipped in oil, and is used to make the surface smooth. A *burnisher* is required to polish the plate, and erases any scratches which it may accidentally receive, and also to make lighter any part of the work which may have been made too dark. The *dry-point* is like a sewing-needle fixed into a handle, and is used to cut or scratch the finer lines. The graver cuts the copper clean out, the dry-point throws it up on each side; and in some cases this is not scraped off, but made use of till it is worn off, as it gives richness to the line.

In etching, the first step is to cover the plate with a composition of wax, asphaltum, gum-mastic, resin, etc., dissolved by heat; an outline of the design, made on paper in pencil or red chalk, is then "transferred" to the surface of this composition, by being passed through a press. The subject is then drawn on the ground with the etching-point, which cuts through it, and exposes the copper. *Etching-points* or *needles* resemble large sewing-needles shortened, and fixed into handles 4 or 5 in. long; some are made oval, to produce broader lines. A rim of wax being put round the plate, acid is poured on, and corrodes the copper not protected by the ground. If the acid is found not to have acted sufficiently, it may be applied again to the whole design, or only to portions of it, by *stopping up*, with a mixture of lampblack and Venice turpentine applied with a camel-hair pencil, what been sufficiently *bitten in*.

When a series of parallel lines are wanted, as in backgrounds, etc., an ingenious machine called a ruler is employed, the accuracy of whose operation is exceedingly perfect. This is made to act on etching-ground by a point or diamond connected with the apparatus, and the tracings are bit in with aquafortis in the ordinary way.

2. The process of *mezzotinto* is by no means so difficult as line-engraving. The plate is prepared by being indented or hacked all over by an instrument with a serrated edge, called a cradle, which is rocked to and fro upon it in all directions. The barb or nap thus produced retains the printer's ink, and if printed, a uniform dark surface would be the result. On this plate, after a tracing has been transferred, the engraver goes to work with tools called scrapers and burnishers—those parts of the ground most smoothed being the highest lights, and the ground the least operated on producing the deepest shadows. As the work proceeds, it may be blackened with ink, applied with a printer's ball or otherwise, in order to ascertain the effect. The design is sometimes etched on the plate by the ordinary process, before the mezzotinto ground is laid.

3. *Aquatint Engraving.*—By this method, the effect of drawings in Indian ink is produced; and at one time it was greatly made use of in rendering the drawings of Paul Sandby and our early water-color painters, and particularly prints for drawing-books. In this process, which is a very complex kind of etching, the ground, which is composed of pulverized rosin and spirits of wine, assumes when dry a granulated form; and the aquafortis acting on the metal between the particles, reduces the surface to a state that an impression from it resembles a tint or wash of color on paper. David Allan engraved his celebrated illustrations of the *Gentle Shepherd* in this manner. It has now gone almost entirely out of use, having, like E. in imitations of drawings in chalk or pencil, been in a great degree superseded by lithography.

4. In E. in *stipple*, which was much in vogue in the end of the last century, the drawing and effect are produced by small dots, in place of lines. Ryland, Bartolozzi, and Sherwin, excelled in this style. It is well suited for portraits; several of Raeburn's have been capitally engraved in stipple by Walker. It involves much more labor than mezzotint, and is now little practiced.

Plate-printing.—Copper-plates, engraved in any of the above styles, are ready for press as soon as they are finished by the engraver. The method of printing from them is very simple. Their engraved surface is daubed over with a thick oleaginous ink, so that the lines are effectually filled. As this dirties the whole face of the plate, it is necessary to clean it, which is done by the workman wiping it first with a piece of cloth,

and then with the palms of his hands, rubbed on fine whiting. It may be calculated that a hundred times more ink is thus removed than actually remains in the identations; however, such is necessary. The plate being thoroughly cleaned, it is laid on a press, with a piece of damped paper over it; and being wound beneath a roller covered with blanket stuff, it is forced to yield an impression on the paper. The plate requires to be kept at a moderate warmth during the operation. The frequent rubbing of the plate with the hand to clean it, as may be supposed, tends greatly to wear it down; and such is the wear chiefly from this cause, that few copper-plates will yield more than a few thousands of impressions in good order. The earliest, called *proofs*, are always the best and most highly prized.

In consequence of this defect in copper, the practice of *engraving steel-plates*, for all subjects requiring a great many impressions, has now become very common. This process was introduced by the late Mr. Perkins of London, who originally softened the plates, engraved them, and then rehardened them—a practice now abandoned, as ordinary steel-plates can be worked upon by the burin, dry-point, scraper, and burnisher with perfect facility. Etching on steel-plates is executed much in the same way as in the process on copper. An E. on a steel-plate may be transferred in relief to a softened steel cylinder by pressure; and this cylinder, after being hardened, may again transfer the design by rolling it upon a fresh steel-plate; and thus the design may be multiplied at pleasure.

History of Engraving.—This most important invention, by which the productions of art are diffused without limit, is said to have been accidental, and is claimed for Tommaso Finiguerra, who first took impressions on paper about the year 1440. His employment was executing ornamental E., chiefly on articles used in religious services, such as small portable shrines, or altar-pieces. These were generally made of silver, and the designs engraved on them were filled up with a black composition, that hardened in a short time. This composition was called in Italian *niello* (from Lat. *nigellus*, dim. of *niger*, black), and the workers in it *niellatori*. It was the practice of Finiguerra, in the course of executing his work, to prove it by rubbing lampblack and oil into, and pressing paper over it; he thus obtained an impression of his work up to a particular stage, and was enabled safely to carry it on till it was completed. Finiguerra's title to the invention has been disputed; and in a recent work by J. D. Passavant, *Le Peintre-Graveur* (Leip. 1860), a strong case seems to be made out for its German origin. Be that as it may, the principal early Italian engravers who followed Finiguerra, were Bacio Baldini (born about 1436, died 1515); Sandro Botticelli (born 1437, died 1515)—he embellished an edition of Dante's *Inferno*, brought out in 1481; Antonio Pollajuoli (born 1426, died 1498, at Florence); Andrea Mantegna (born at Padua 1431, died at Mantua 1505); and Marc Antonio Raymondi (born at Bologna 1487 or 1488, died 1539), who executed his chief works at Rome. The most celebrated early German engravers were Martin Schoengauer (born at Colmar about 1455, died 1499); Israel van Mecheln, or Meckenen (born at Meckenen on the Meuse about 1450, and died 1523); Michel Wohlgemuth, who died in 1519; Albert Dürer (born at Nürnberg in 1471, died in 1528); and Lucas van Leyden (born at Leyden 1494, died 1533). The engravings of all these artists are very valuable, not only from their scarceness, and as illustrating the early history and progress of the art, but as exemplifying many high qualities that have never been surpassed in later times. The most of them were painters, and engraved their own works, except Marc Antonio, who engraved chiefly those of Raphael, by whom he was employed, and who occasionally overlooked and directed him. All those engravers, and their immediate followers, executed their works with the graver; but soon after, engravings came to be generally executed by two processes—etching, and cutting with the graver or the dry-point. The works of these early masters are often remarkable for character and expression, as those, for instance, by Mantegna; and for the correctness and high style of the drawing, for which qualities Marc Antonio has never been surpassed; also for finish of the most careful and elaborate kind, which has been carried further by Albert Dürer and Lucas van Leyden than by any other engravers. The styles of these early engravers were cultivated by numerous successors, several of whom followed their masters as closely as they could, while others diverged into something like originality: the chief names are Agostino Veneziano, about 1620; Nicolas Belin da Modena, and Giov. Ghisi, 1630; Luc. Damesz, who died in 1533; Giov. Giac. Caraglio, and Marco da Ravenna, about 1640; Giul. Bonasone, born at Bologna in 1498, died in Rome in 1564; Eneus Vicus, George Vens, Henrid Aldegraf, and Jean Sebast. Bœhm, about 1550; Adrian, Charles, William, and John Collert, Adam and George Ghisi, Sutermann, Virgilius Solis, Cornelius Cort, Martin Rota, and others, ranging from the middle to the end of the 16th century. Agost. Caracci, the celebrated painter, executed many spirited engravings. Saenredam, De Bruyn, Galle, Kellerthaller, Alberti, De Goudt, C. de Pass, Sadeler, are names of well-known engravers that enter on the 17th century. Henry Goltzius is noted for the number and variety of his works, and his imitations of the styles of the older masters. In the plates of engravers towards the middle of the 17th, and beginning of the 18th c., a large proportion of the work consists of etching, the graver being chiefly used for deepening and clearing up the etching. This arose from the manner of working being well adapted for rendering the style of the painters of that period, whose works were distinguished for freedom of execution or touch, and clear-

ness and transparency. The most noted engravers of this period were the Vischers, who flourished between 1610 and 1650, and engraved many of Berghem's pictures; Bolswert, 1620; Lucas Vosterman the elder, 1630; Suyderhoef, about 1640. These engravers rendered many of the works of Rubens in a very spirited manner. Coryn Boel—whose engravings from Teniers are in some respects superior even to La Bas—Troyen, and Van Kessel, are worthy contemporaries.

In the age of Louis XIV., a race of engravers of portraits arose, who carried execution with the graver almost to perfection. The works of the artists they engraved from were florid in style, with a great display of drapery and lace, and accessories in the backgrounds elaborately executed. Among these engravers the following rank highest: Gerard Edelinck (b. Antwerp 1627, d. Paris 1707)—he was one of the best engravers of the period, and specially patronized by Louis XIV.; Masson (b. 1636, d. 1700); Larmessin (b. 1640, d. 1684); Drevet the elder (b. 1664, d. 1739); Drevet the younger (b. 1697); Gerard Andran (b. 1640, d. 1703). There was a large family of Andrans engravers, but Gerard was the most celebrated, indeed, he was one of the best of the French engravers. Among engravers of talent in England may be mentioned Robert Walker (b. 1572); William Faithorne (b. London between 1620 and 1630, d. 1694) executed many excellent engravings of portraits; George Vertue (b. London 1684, d. 1756), a good engraver, and a man of general information and taste in matters of art; John Smith (b. London 1654, d. 1722) executed in mezzotinto a vast number of interesting portraits. In the 18th c., there were numerous excellent engravers, by whose works the taste for the pictures of the Dutch school of the 17th c. has been widely extended. Two of the most distinguished of these were John Philip le Bas (b. Paris 1708, d. 1782) and John George Wille (b. Königsberg 1717, d. 1808). Their styles are totally dissimilar. Le Bas's plates are chiefly etched, and remarkable for spirit and sharpness of touch and transparency; accordingly, mostly all his works are after painters who excelled in these qualities, particularly Teniers. Wille's engravings, again, are of the most careful and elaborate description, and his best prints are after Gerard Dow, Terburg, Mieris, and Metzu—masters distinguished for the high finish of their pictures. He worked with the graver; and his plates are distinguished by the precision and clearness with which the lines are cut.

It was about the middle and latter portion of last century that engraving reached its highest point in England. The works of William Hogarth (b. London 1698, d. 1764) are of world-wide celebrity, but that is owing mainly to the excellence and dramatic interest of the pictures from which the engravings are made, though, no doubt, his prints are engraved in a firm clear style, similar to that practiced by the French engravers of the time, several of whom were employed by him. It was sir Robert Strange (b. Orkney 1721, d. London 1792), an engraver of figures, and William Woolet (b. Maidstone 1735, d. London 1785), a landscape-engraver, who imparted to English E. those qualities and characteristics that enable us to claim a style of E. that is national, differing from other styles, and that has arisen and been best carried out in this country. In drawing and form, Strange was rather defective; but he excelled in what engravers call color, or the art of producing, by means of variety of line, a texture or quality that compensates for the want of color, by giving to the E. something of the richness produced by color in a picture. His imitation of the softness and semi-transparency of flesh was particularly successful, and superior to that of the French engravers, whose works, though in most respects admirable, failed in that respect, and had, in the more delicate parts, a hard or metallic look. Woolet treated landscape-engraving in a manner totally new, imparting to it more firmness and decision, by making great use of the graver. His works have more finish and force than former landscape-engravers, but they are in some degree liable to the objection of hardness, in the treatment of foliage in particular. The works of these two engravers have had a marked influence on art, not only in this country, but abroad. The merit of Strange's style was acknowledged on the continent; he was elected a member of the academies of Florence, Bologna, Parma, and Rome. At the end of last century, art had fallen very low on the continent, but a regeneration was beginning; and in Italy, engravers were then arising, such as Volpato and Cunego, who studied and imitated the softness and, technically speaking, fleshiness of texture that distinguished the works of the British engraver; those, again, were followed by Raphael Morghen, Longhi, Mercuri, and others, in Italy; by Boucher Desnoyers, Forster, etc., in France; and by Müller, Keller, Gruner, and numerous other engravers in Germany. By them, engraving has been carried to the highest pitch. Amongst their works, the following are *chefs-d'œuvres:* "The Last Supper," after Da Vinci, by R. Morghen; the "Sposalizia," after Raphael, by Longhi; "La Belle Jardinière," and other works, after Raphael, by Boucher Desnoyers, who has engraved the works of Raphael perhaps on the whole better than any other engraver. "The Madonna de San Sisto," by Müller, and "The Dispute on the Sacrament," after Raphael, of Keller. No engravings executed in this country come up to the works of these last-named masters, who have engraved works of a higher class than the majority of those done by Strange, while the drawing and general treatment of their works are in a purer and more correct style. However, the engravings of Burnet, Raimbach, Stewart, and others after Wilkie and contemporary British painters, deservedly held the highest place among works of the class to which they belong, and betoken clearly the great influ-

ence which Strange exercised on their style. At present, few figure-subjects are executed in the line-manner, and that art has certainly fallen in this country. This may be accounted for, perhaps, by the great use made of mechanical appliances, in portions of the work, to save time, and by the preference shown for mezzotinto-engraving as practiced at present, that is, with a mixture of lining or stippling. The greater number of Landseer's works have been engraved in that way, and it is now adopted for rendering the works of John Phillip and Millais, and the leading artists of the day. Several, however, of Landseer's earlier works have been engraved in the line-manner, particularly his pictures of "Drovers Leaving the Grampians," and "The Watering-place," by Watt, which are capital examples of line-engraving. There is no good modern school of landscape-engraving on the continent; the influence of Woolet was entirely confined to this country, where landscape-engraving, particularly in illustrated works after Turner, has attained great excellence.

Towards the end of last century, mezzotint engraving was practiced in England with great success; arising from its being peculiarly adapted to render effectively the works of sir Joshua Reynolds. M'Ardell, Earlom, Watson, Smith, Valentine Green, and Ward were among the best engravers of his works. The invention of this process is generally given to prince Rupert, others ascribe it to Dr. Wren, 1662, and state that prince Rupert merely improved on the invention. It has been practiced very generally from the time of its invention, but attained its highest position in sir Joshua's time; and it is very successfully carried out now, in an altered manner, additional force being aimed at, by means of stippling and etching. It is well calculated for producing broad effects: Turner's *Liber Studiorum*, and the landscapes after Constable, are admirable examples of its capabilities in this way; the effect in Turner's plates, however, is heightened by etching.

Etching has been already described as a part of the process of E.; but as practiced by painters, it is classed as a distinct art. The plate is prepared with a ground, and corroded in the same way; but the treatment is more free. Not being tied to the task of literally copying or translating the idea of another, like the engraver, the painter has scope to impart a spirit to his work peculiarly suggestive of what he intends to embody; his idea is represented directly, and not at second-hand, as it were. The etchings of Rembrandt, Paul Potter, Karl du Jardin, Adrian Vandevelde, Teniers, Ostade, Berghem, Backhuysen, Van Dyck, Claude, Salvator Rosa, Canaletti, and other painters, are very highly valued, as conveying more completely the feeling of the painter than the best engravings. Etching was more practiced by the old than by modern painters; yet Wilkie, Landseer, and other modern artists, have etched various plates, remarkable for character and spirit.

English works on E.—*Sculpture, or the History and Art of Chalcography and Engraving on Copper*, by John Evelyn (Lond. 12mo, 1663; 8vo, 1755); *The Art of Engraving and Etching, with the Way of Printing Copper-plates*, by M. Faithorne (Lond. 1702); *Sculptura Historico-technico, or the History and Art of Engraving, extracted from Baldinucci Florent, Le Compt, Faithorne, the Abecadario Pittorico, and other authors* (Lond. 4to, 1747, 1766, and 1770); *An Essay upon Prints*, by Gilpin (Lond. 8vo, 1767, 1768, and 1781); Strutt's *Biographical Dictionary of Engravers* (2 vols., 4to, Lond. 1785); Landseer's *Lectures on Engraving* (8vo, Lond. 1806); *An Inquiry into the Origin and Early History of Engraving upon Copper and on Wood*, by William Young Ottley (4to, Lond. 1816).

Of late years, many inventions have been introduced, having for their object to supersede the slow and laborious manual operations of E. by means of machinery and other appliances. It is, however, to business and ornamental purposes that they are chiefly applicable, and not to the production of artistic work of the kind treated of in this article. The subject will be noticed under MACHINE ENGRAVING, MEDALS, GLASS, etc. With regard to the reproduction of plates, and other applications of galvanic electricity to E., see GALVANISM and MAGNETO-ELECTRICITY. See also PHOTOGRAPHIC ENGRAVING.

ENGRAVING (*ante*). The 19th c. has produced most highly accomplished work in line engraving, both in figure and in landscape. Its characteristics, in comparison with the work of other centuries, are chiefly a more thorough and delicate rendering of local colors, light and shade, and texture. The older engravers could draw as correctly as the modern; but they either neglected these elements or admitted them sparingly, as opposed to the spirit of their art. If you look at a modern engraving from Landseer, you will see the blackness of a gentleman's boot (local color), the soft roughness of his coat (texture), and the exact value in light and dark of his face and costume against the cloudy sky. Nay, more, you will find every sparkle on bit, boot, and stirrup. Modern painting pays more attention to texture and *chiaroscuro* than classical painting did, so engraving has followed in the same directions; but there is a certain sameness in pure line engraving which is more favorable to some forms and textures than to others. This sameness of line engraving, and its costliness, have led to the adoption of mixed methods, which are extremely prevalent in modern commercial prints from popular artists. In the well-known prints from Rosa Bonheur, for example, by T. Landseer, H. T. Ryall, and C. G. Lewis, the tone of the sky is produced by machine-ruling, and so is much under tone in the landscape; the fur of the animals is all etched, and so are the fore-

ground plants, the real burin work being used sparingly where most favorable to texture. Even in the exquisite engravings after Turner, by Cooke, Goodall, Wallis, Miller, Wilmore, and others, who reached a degree of delicacy in light and shade far surpassing the work of the old masters, the engravers have recourse to etching, finishing with the burin and dry-point. Turner's name may be added to those of Raphael, Rubens, and Claude in the list of painters who have had a special influence upon engraving. The specialty of Turner's influence was in the direction of delicacy of tone. In this respect the Turner vignettes to Rogers' poems were a high-water mark of human attainment, not likely to be surpassed.

Pure line engraving is still practiced by a few artists in England and France. In France, the lovers of line engraving have endeavored to keep it alive by organizing themselves into a society for its encouragement. The most recent direction of the art, in the works of Ferdinand Gaillard, is a return to studied outline, but in combination with the most elaborate modeling. In his "St. Sebastian" the outline is studied and marked with careful firmness throughout, and the modeling is thoroughly worked out in minute touches and fine lines, giving powerful relief without any but the most delicate chiaroscuro.

To prepare a plate for etching, it is first covered with etching-ground, a composition which resists acid. A ground is to be of a quality so adhesive that it will not quit the copper when a small quantity is left isolated between the lines, yet not so adhesive that the etching point cannot easily and entirely remove it; at the same time a good ground will be hard enough to bear the hand upon it, or a sheet of paper, yet not so hard as to be brittle. The plate being grounded, its back and edges are protected from the acid by Japan varnish, which soon dries; then the drawing is traced upon it. The best way of tracing a drawing is to use sheet gelatine, which is employed as follows: The gelatine is laid upon the drawing, which its transparency allows you to see perfectly, and you trace the lines by scratching the smooth surface with a sharp point. You then fill these scratches with fine black-lead in powder, rubbing it in with the finger; turn the tracing with its face to the plate, and rub the back of it with a burnisher. The black-lead from the scratches adheres to the etching-ground, and shows upon it as pale gray, much more visible than anything else which you can use for tracing. Then comes the work of the etching-needle, which is merely a piece of steel sharpened more or less. Turner used a prong of an old steel fork, which did as well as anything; but neater etching-needles are sold by artists' color-makers. The needle removes the acid and lays the copper bare. Some artists sharpen their needles so as to present a cutting edge, which, when used sideways, scrapes away a broad line; and many etchers use needles of various degrees of sharpness to get thicker or thinner lines. It may be well to observe, in connection with this part of the subject, that while thick lines agree perfectly well with the nature of wood-cut, they are very apt to give an unpleasant heaviness to plate engraving of all kinds, whilst thin lines have generally a clear and agreeable appearance in plate engraving. Nevertheless, lines of moderate thickness are used effectively in etching when covered with fine shading, and very thick lines indeed were employed with good results by Turner when he intended to cover them with mezzotint and to print in brown ink, because their thickness was essential to prevent them from being overwhelmed by the mezzotint, and the brown ink made them print less heavily than the black. Etchers differ in opinion as to whether the needle ought to scratch the copper or simply to glide upon its surface. A gliding needle is much more free, and therefore communicates a greater appearance of freedom to the etching; but it has the inconvenience that the etching-ground may not always be entirely removed, and then the lines may be defective from insufficient biting. A scratch needle, on the other hand, is free from this serious inconvenience; but it must not scratch irregularly so as to engrave lines of various depth. The biting in former times was generally done with a mixture of nitrous acid and water, in equal proportions; but in the present day a Dutch mordant is much used, which is composed as follows: Hydrochloric aid, 100 grammes; chlorate of potash, 20 grammes; water, 880 grammes. To make it, heat the water, add the chlorate of potash, wait until it is entirely dissolved, then add the acid. The nitrous mordant acts rapidly, and causes ebullition; the Dutch mordant acts slowly, and causes no ebullition. The nitrous mordant widens the lines; the Dutch mordant bites in depth, and does not widen the lines to any perceptible degree. The time required for both depends upon temperature. A mordant bites slowly when cold, and more and more rapidly when heated. To obviate irregularity caused by difference of temperature, a good plan is to heat the Dutch mordant artificially to 95° F. by lamps under the bath, for which a photographer's porcelain tray is most convenient, and to keep it steadily to that temperature; the result may be counted upon; but whatever the temperature fixed upon, the result will be regular if the temperature be regular. To get different degrees of biting on the same plate, the lines which are to be pale are "stopped out" by being painted over with Japan varnish, or with etching-ground dissolved in oil of lavender, the darkest lines being reserved to the last, as they have to bite longest. When the acid has done its work properly, the lines are bitten in such various degrees of depth that they will print with the degree of blackness required; but if some parts of the subject require to be made paler, they can be lowered by rubbing them with charcoal and olive oil, and if they have to be made deeper, they can be re-bitten or cov-

ered with added shading. Re-biting is done with the roller above mentioned, which is now charged very lightly with paste, and rolled over the copper with no pressure but its own weight, so as to cover the smooth surface, but not to fill up any of the lines. The oil of lavender is then expelled as before by gently heating the plate, but it is not smoked. The lines which require re-biting may now be re-bitten, and the others preserved against the action of the acid by stopping out. These are a few of the most essential technical points in etching, but there are many matters of detail for which the reader is referred to the special works on the subject. During the last twenty years there has been a great revival of etching as an independent art. The comparative rapidity of the process, and the ease with which it imitates the manner of painters, have caused it to be now very generally preferred to line engraving by publishers for the transcription of all pictures except those belonging to a severe and classical style of art.

Aquatint may be effectively used in combination with line-etching, and still more harmoniously with soft-ground etching in which the line imitates that of the lead pencil. Of all kinds of engraving, mezzotint comes nearest to nature, though it is far from being the best as a means of artistic expression. Copper, steel, and zinc are the metals chiefly used in engraving. The use of copper is largely increased of late, as the copper is now coated with steel by electrotype process, which enables it to resist printing almost indefinitely, and the steel can be removed at pleasure. Zinc is similarly coated with copper, and is sometimes used for small editions. [Condensed from *Encyclopædia Britannica*, 9th ed.] See WOOD ENGRAVING.

ENGRAVINGS, PROPERTY OF. The property of engravings and prints is secured by statutes similar to those for the protection of literary property. By 8 Geo. II. c. 13, the property of historical and other prints was declared to be invested in the inventor for 14 years. The proprietor's name must be affixed to each print, and the statute imposes a penalty on print-sellers and others pirating the same. The provisions of this statute were extended by 7 Geo. III. c. 38, which secures to the widow of William Hogarth the sole right of printing and reprinting his works for the period of 20 years. The other acts are 17 Geo. III. c. 57, 6 and 7 Will. IV. c. 59—which extends the former acts to the whole United Kingdom—and 15 Vict. c. 12. The remedy was also simplified by 25 and 26 Vict. c. 68, enabling justices of the peace and the sheriff to act summarily in recovering penalties. The act 15 Vict. c. 12 was passed to explain the international copyright acts, and to explain the acts relating to copyright in engravings—reduces the duties on foreign engravings, and extends the protection of the acts to prints taken by lithography, or "any other mechanical process by which prints or impressions of drawings or designs are capable of being multiplied indefinitely"—a clause which has now been found to cover photographs.

ENGROSSING A DEED. See INGROSSING.

ENGROSSING AND REGRATING. An engrosser, regrater, or forestaller, is a person who buys grain, flesh, fish, or other articles of food, with the intention of selling them again at an enhanced price, either in the same fair or market, or in another in the neighborhood, or who purchases or contracts for corn while still in the field. These practices were regarded as criminal in most countries, before the laws by which trade is regulated were properly understood. In England, they were forbidden by various statutes, from the time of Edward VI. to that of queen Anne. These statutes were repealed by 12 Geo. III. c. 71, on the preamble, that it hath been found by experience, that the restraints laid upon the dealing in corn, meal, flour, cattle, and sundry other sorts of victuals, by preventing a free trade in the said commodities, have a tendency to discourage the growth, and to enhance the price of the same. It was found, however, that engrossing was not only a statutory but a common law offense, and a prosecution for it in the latter character actually took place in the present century. The act 7 and 8 Vict. c. 24, for abolishing the offenses of forestalling, regrating, and engrossing, was consequently passed. Besides declaring that the several offenses of badgering, engrossing, forestalling, and regrating be utterly taken away and abolished, and that no information or prosecution shall lie either at common law or by virtue of any statute, either in England, Scotland, or Ireland, this statute repeals a whole host of earlier enactments in restraint of trade, which had been omitted in the statute in the time of George III., above referred to. The rubrics of these enactments give a curious picture not only of the trading errors, but in many other respects of the obsolete customs of our ancestors. The first, for example (51 Henry III.), is called a "statute of the pillory and tumbrel, and of the assize of bread and ale." Then there is an act passed in several reigns which provides for the punishment of "a butcher or cook that buyeth flesh of Jews, and selleth the same to Christians."

Notwithstanding the doctrine of the Scottish law, that statutes may be repealed by mere desuetude, it was thought safer to include the Scottish statutes to the same effect. The earliest is 1503, c. 38, and the latest 1661, c. 280.

The statute 6 and 7 Vict. c. 24, does not apply to the spreading of false rumors, with the intent to enhance or decry the price of merchandise, or preventing goods from being brought to market by force or threats, which continue to be punishable as if that act had not been made.

ENG AND SHANG. See SIAMESE TWINS, *ante.*

ENGUE'RA, a t. of Spain, in the province of Valencia, 43 m. s.w. of the town of that name. It is poorly built, and has narrow and irregular streets. It has manufactures of linen and woolen goods, and some trade in cattle and agricultural produce. Pop. 5,250.

ENGUICHÉ. A hunting-horn, the rim around the mouth of which is of a different color from the horn itself, is said heraldically to be enguiché, of the color in question.

ENHARMONIC, a term applied in music when the name of a note is changed without any sensible difference of sound, such as C♯ and D♭, F♯ and G♭. Correctly speaking, there is, or ought to be, a difference; but on keyed instruments, such as the organ and pianoforte, there can be none, as the same key serves for both sharp and flat, while with a just equal temperament the ear is in no way offended. In harmony, the principal seat of enharmonic change is in the chord of the diminished seventh, which, by a change of the notes, may be treated fundamentally in four different ways, without any sensible difference in the intonation.

ENKHUI'SEN, a fortified t. and seaport of the Netherlands, in the province of North Holland, is situated on the western shore of the Zuider Zee, about 30 m. n.e. of Amsterdam. It is built with great regularity, and is of a circular form. The most important public building is an elegant town-house, with a lofty tower. There are two Dutch Reformed churches, to which five sixths of the people belong, the rest being Lutherans, Roman Catholics, Moravians, and Jews. The chief industries are ship and boat-building, rope-spinning, sail-making, refining salt, brewing, etc. There is a small trade in butter, cheese, corn, timber, cattle, and fish. Several vessels are engaged in the herring-fishing. Pop. '75, 5,560.

ENLISTMENT is the mode by which the English army is supplied with troops, as distinguished from the CONSCRIPTION prevailing in many other countries. Enlistment was in private hands until the year 1802, middlemen procuring recruits, and receiving a profit or commission for their trouble. This system being subject to much abuse, the matter was taken into the hands of the government in the above-named year, and is now managed by the adj.gen. Formerly, a soldier enlisted for life, and could never look forward to a period of freedom; or, at best, he could not retire on a pension while still possessed of a fair share of health and strength. This system was changed in 1847, by an act relating to *limited* enlistment; which provided that a man should enlist for 10 years for the infantry, or for 12 for the cavalry or artillery. At the expiration of this period, he could either quit the army, without pension; or re-enlist for the remainder of 21 years for the infantry, or 24 years for cavalry or artillery. This second period of service entitled the soldier to a pension for life, after his discharge: and, in 1868, twopence a day was added to the pay of every soldier who re-enlisted (or re-engaged). This system of enlistment provided soldiers: but did nothing for the growth of trained reserves, with which to bring the army to fighting strength in the event of war. The "army enlistment act," of 1870, seeks to remedy this defect, by allowing men to enlist for 12 years, with the understanding that 6 years or less shall be passed with the colors, and the remainder with the reserve. This is known as "short service;" and, under the system, from 1876 onward, a reserve of trained soldiers will be formed. It is estimated that with an army of 180,000 men, of whom three fourths are to serve only six years with the colors, there will accrue, by 1882, a reserve of 100,000 trained men, all under 32 years of age. If apprentices enlist, the master may recover them under certain conditions detailed in the mutiny act (q.v.) (which is passed every year). The mutiny act also provides that servants enlisting before the term of their engagement, are validly enlisted, and are entitled to wages up to the date of enlistment. Periods of imprisonment are not reckoned as part of the time of limited enlistment. A recruit enlists into either one of the 70 sub-district brigades, each of which comprises either a two-battalion regiment, or two single-battalion regiments, or he enlists for general service in any regiment to which the adj.gen. may post him; but artificers, as armorers, etc., are usually enlisted for general service, so that their services may be made available where most required. The army discipline and regulation act of 1879 made several important alterations in regard to enlistment. The recruit had always to appear before a magistrate, but formerly could not refuse to take the oath without paying a fine of 20*s*. Now he is not enlisted until he appear before the magistrate, who causes to be read to him a series of authorized questions, and satisfies himself that the man is not under the influence of liquor, and voluntarily agrees to enlist. The recruit then signs the declaration, takes the oath, and is attested by the magistrate. If the recruit does not so appear, or appearing does not assent, no further proceedings are taken. If within three months of his attestation a recruit pays a sum not exceeding £10, he is now entitled to be discharged.

ENLISTMENT, in the navy, is managed by the admiralty, and is changed from time to time in its details, according to the degree of willingness among sea-faring men to enter the service. In 1830, an act was passed to give certain additional advantages to volunteer seamen. In 1835, another act empowered the crown to double the amount of bounty given to a volunteer, if he was already a seaman. In 1847, it was enacted that

such persons as were entitled, if enlisted, to double bounty, should form a select class; and that ship-owners should not be allowed to hire such persons as crews for merchant-ships, if the government thought proper to issue a proclamation to that effect. At the commencement of the war with Russia, in 1854, it was deemed expedient not only to give extra bounties to seamen willing to enlist, but to make a money-present to seamen already in the navy, as an equivalent advantage. The bounty given to seamen varies from time to time, according to the exigencies of the service; but recent legislation has established a distinction between *limited* and *continuous* service. A seaman may enlist for 5 or for 10 years, or for the period the ship he enters is in commission; if for the longer period, he receives higher pay and other advantages. At the end of this longer period, he may demand his discharge; and, if abroad, he may claim to be brought home free of expense. His commanding-officer may, in emergency, retain his further service for 6 months, on payment of another increase of pay. The crown, besides, possesses a power of compelling renewed service from seamen under certain conditions, in case of invasion or other national peril.

Other matters bearing on this subject will be found noticed under BOUNTY, COAST VOLUNTEERS, IMPRESSMENT, and MANNING THE NAVY.

ENLISTMENT (*ante*), in the United States army, is superintended by the bureau of recruiting service, the chief officer of which is stationed in New York. There are quarters or branches in nearly all the large cities of the union, and two depots to which recruits are sent—fort Columbus, New York harbor, and the barracks at Newport, Ky. Men are enlisted for five years, and may be assigned to any branch of the service.

ENLISTMENT DURING THE REBELLION. The following is a list of the various "calls" for troops by the United States government during the war of the rebellion.

Date of Call.	Number of Men.	Term of Service.	Number obtained.
April 15, 1862	75,000	3 months	93,226
May to June 25, 1863	530,000	3 years	714,213
July 2, 1862	300,000	3 years	431,958
Aug. 4, 1862	300,000	9 months	87,000
Oct. 17, 1863	300,000	3 years	374,807
Feb. 1, 1864	200,000	3 years	
Mar. 14, 1864	200,000	3 years	284,021
July 18, 1864	500,000	1-2-3 years	384,882
Dec. 19, 1864	300,000	1-2-3 years	204,568

There were other calls for 30 and 100 days' men. The whole number called for was 2,759,049; total obtained 2,656,553. By act of congress Mar. 3, 1863, called the "conscription act," the president was authorized to draft troops. The act provided for an enrollment, a draft, the reception of substitutes, and arrest of deserters. About 3,000,000 men between the ages of 20 and 45 were enrolled. The calls from Oct. 17, 1863, were orders for drafts. But probably not more than 50,000 drafted men performed personal service. Substitutes were obtained. "The substitute fund" of the government, consisting of money paid in as a release from service, and which was used as a "bounty fund" for volunteers, amounted to $25,902,029.

ENMANCHÉ, or EMANCHÉ. See MANCHE.

ENNEAN'DRIA, the ninth class of plants in the Linnæan system, so called because the flowers have nine stamens. It is a small class, and the Linnæan classification being now generally superseded, the term is not often used.

ENNEMOSER, JOSEPH, known as a medico-philosophic writer, was b. 15th Nov., 1787, at Hintersee, in the Tyrol, and commenced his academic studies at Innsbruck in 1806. On the rising of the Tyrolese against the French in 1809, E. followed Andreas Hofer as his secretary, and honorably distinguished himself in battle on several occasions. At the close of the war, he went to Erlangen, and subsequently to Vienna, for the purpose of concluding his studies. Here, however, he experienced the greatest difficulty in procuring the means of subsistence, but fortunately fell in with a merchant from Altona, in whose company he traveled for some time. When Napoleon declared war against Russia in 1812, E. was despatched to England, to solicit aid for the Tyrolese in their meditated insurrection against the French domination. He was afterwards appointed by Friedrich Wilhelm III., king of Prussia, an officer in a regiment of volunteers, and soon gathered about him a company of Tyrolese marksmen, who were of great service during the campaigns of 1813 and 1814. After the peace of Paris, E. went to Berlin, where he finished his curriculum, and in 1816, took his degree of doctor of medicine. In 1819, he was made professor of medicine at the new university of Bonn, where he lectured on anthropology, physical therapeutics, and pathology. A love of his native country induced him to settle as a physician in Innsbruck, but in 1841 he went to Munich, where he obtained a great reputation by the application of magnetism as a curative power. Among his writings may be mentioned, *Der Magnetismus in seiner geschichtlichen Entwickelung* (Leip. 1819), which is reckoned his principal work:

Historisch-psychologische Untersuchungen Über den Ursprung und das Wesen der Menschlichen Seele (Bonn, 1824); *Anthropologische Ansichten zur bessern Kenntniss des Menschen* (Bonn, 1828); *Der Magnetismus im Verhältniss zur Natur und Religion* (Stuttg. 1842); *Der Geist des Menschen in der Natur* (Stuttg. 1849); *Was ist die Cholera* (2d edit., Stuttg. 1850); and *Anleitung zur Mesmer'schen Praxis* (Stuttg. 1852). He died in 1854.

EN NIS, a parliamentary and municipal borough, chief t. of co. Clare, Ireland, on the Fergus, 20 m. w.n.w. of Limerick, is a neat town, with some good houses. Pop. '71, 6,503, of whom 6,102 were Roman Catholics, and 401 of all other denominations. It returns one member to parliament. It has the ruins of a monastery founded in 1240 by O'Brien, prince of Thomond. Near the town is Ennis college, founded by Erasmus Smith. E. has a valuable limestone quarry, large flour-mills, and some trade in grain and cattle.

ENNISCOR THY, a market t. in the middle of Wexford co., Ireland, on a rising ground on the Slaney, 14 m. n.n.w. of Wexford. The Slaney is here tidal and navigable for barges, and flows through a fertile and beautiful valley. Pop. '71, 5,594, of whom 4,966 were Roman Catholics, and 628 of all other denominations. E. has a large corn-trade. It arose in a Norman castle, still entire, founded by Raymond le Gros, one of the early Anglo-Norman invaders. Cromwell took E. in 1649; and the Irish rebels stormed and burned it in 1798.

ENNISKIL LEN, a parliamentary and municipal borough, chief town of co. Fermanagh, Ireland, about 75 m. w.s.w. of Belfast, is beautifully situated on the Erne; the greater portion on an isle in the river between the upper and lower loughs Erne. It consists mainly of one undulating street running e. and west. Around, are richly cultivated eminences and many fine mansions. Its two forts command the only pass for 50 m. into Ulster across the Erne. The chief manufactures are cutlery and straw-plait. Pop. '71, 5,836, of whom 3,272 were Roman Catholics, 2,096 Episcopalians, and the rest of other denominations. It returns one member to parliament. E. is famous for the victory, in 1689, of the troops of William III., under lord Hamilton, over a superior force of James II., under lord Galmoy. The banners taken in the battle of the Boyne hang in the town-hall. The regiment of Enniskilleners, or 6th dragoons, was first instituted from the brave defenders of the town.

EN'NIUS, one of the earliest Roman poets, the father of the Roman Epos, was b. at Rudiæ, in Calabria, about 240 years before the Christian era, and was probably of Greek extraction. He is said to have served in the wars, and to have risen to the rank of a centurion. In Sardinia, he became acquainted with Cato the elder, and returned with him to Rome, when about the age of 38. Here he gained for himself the friendship of the most eminent men, among others that of Scipio Africanus the elder, and attained (what was then exceedingly rare in the case of an alien) to the rank of a Roman citizen. He supported himself in a decent but humble manner by instructing some young Romans of distinguished families in the Greek language and literature, his accurate knowledge of which explains the influence he had on the development of the Latin tongue. He died when he had attained the age of 70, or about 190 B.C. His remains were interred in the tomb of the Scipios, and his bust was placed among those of that great family. E. has tried his powers in almost every species of poetry, and although his language and versification are rough and unpolished, these defects are fully compensated by the energy of his expressions, and the fire of his poetry. His poems were highly esteemed by Cicero, Horace, and Virgil: the last, indeed, frequently introduces whole lines from the poety of E. into his own compositions. His memory seems to have been lovingly cherished by his countrymen; *Noster Ennius*, "Our Ennius," they used to call him. Of his tragedies, comedies, satires, and particularly of his *Annales*, an epos in 18 books, only fragments are still extant. What adds to our regret is, that it is believed his whole works were extant as late as the 13th c. (A. G. Cramer, *Hauschronick*). The fragments have been collected and edited by various scholars, among others by Hessel (Amst. 1707). The fragments of the *Annales* have been edited by Spangenberg (Leip. 1825). Compare Hoch, *De Ennianorum Annalium Fragmentis* (Bonn, 1839). The few fragments of his dramas that have come down to us were collected by Ribbeck in his *Scenicæ Romanorum Poesis Fragmenta* (2 vols. 1871–73).

ENNS, a river of Austria, rises at the northern base of a branch of the Noric Alps in the crownland of Salzburg, 12 m. s. of Radstadt. It first flows n. to Radstadt, then n.n.e. to Hieflau, after which it proceeds in a general direction n.n.w., passes Steyer, and joins the Danube 11 m. below the town of Linz, after a course of about 120 miles. Its chief affluents are the Salza and the Steyer. For the last 15 m. of its course, the E. forms the boundary between Upper Austria (Ober der Enns) and Lower Austria (Unter der Enns). The scenery on the banks of the E. is in general bold and romantic, as it flows, for the most part, between parallel mountain-chains, which are lofty and precipitous. In its lower course, it becomes navigable, but it is chiefly important from the valuable water-power which it supplies.

ENNS, or ENS, a t. in Austria, on the river Enns, near its junction with the Danube; pop. '69, 3,784. It has iron and steel manufactures. It stands on the site of a Roman station, Lauriacum, where in 304 Galerius inflicted a cruel persecution upon the Chris-

tians. The walls of the town were built with the ransom money paid for Richard I. of England.

ENOCH, the name of two different individuals in Scripture.—1. The eldest son of Cain, who built a city which was called after his name.—2. The son of Jared, and father of Methuselah. A peculiarly mysterious interest attaches to him on account of the supernatural manner in which his earthly career terminated. We are told by the writer of Genesis, that E. "walked with God 300 years . . . and he was not; for God took him." What the statement "he was not" signified to the later Jews, is explained by the writer of the Epistle to the Hebrews: "Enoch was translated that he should not see death." E. and Elijah are the only human beings on record who did not require to discharge the debt which mortals owe to nature. It may naturally be supposed that E. was a character on whom the extravagant fancy of the later Jews would fasten with unusual pleasure. As they came more and more into contact with Grecian and other culture, they felt the necessity of linking on the arts and sciences of Gentile nations to their own history, if they would continue to preserve that feeling of supremacy which was so dear to their pride as the chosen people. Hence, E. appears as the inventor of writing, arithmetic, astronomy, etc., and is affirmed to have filled 300 books with the revelations which he received, the number 300 being obviously suggested by the number of years during which he is said to have walked with God.

ENOCH, Book of. This book, from which, curiously enough, St. Jude quotes as if it were history, shows how richly mythical the history of the mysterious antediluvian E. had become! It was probably written originally in Aramaic, by a native of Palestine, in the 2d. c. B.C. The precise date is not known. At subsequent periods, it would seem to have been enlarged by additions and interpolations. It is divided into five parts; and the *first* discourses of such subjects as the fall of the angels, and the journey of E. through the earth and through Paradise in the company of an angel, by whom he is initiated into the secrets of nature, etc.; the *second* contains E.'s account of what was revealed to him concerning the heavenly or spiritual region; the *third* treats of astronomy and the phenomena of the seasons; the *fourth* represents E. beholding, in prophetic vision, the course of Divine Providence till the coming of the Messiah; and the *last* consists of exhortations based on what has preceded. The book was current in the primitive church, and was quoted by the fathers, but was lost sight of by Christian writers about the close of the 8th c., so that until last century it was only known by extracts. Fortunately, however, the traveler Bruce discovered in Abyssinia three complete MSS. of the work, which he brought to England in 1773. These MSS. proved to be an Ethiopic version made from the Greek one, in use among the fathers, as was evident from the coincidence of language. The Ethiopic version did not appear till 1838, when it was published by archbishop Lawrence. An English translation, however, by the same writer, had appeared in 1821, which passed through three editions, and formed the basis of the German edition of Hoffmann (Jena, 1833–1838). In 1840, Gfrörer published a Latin translation of the work; but by far the best edition is that of Dr. A. Dillmann, who, in 1851, published the Ethiopic text from five MSS.; and in 1853, a German translation, with an introduction and commentary, which has recently turned the attention of many German scholars to the subject.

ÉNOM'OTO KAMAJI'RO, one of the Japanese young men of promise sent by the tycoon in 1862 to study in Europe. In Holland, E. obtained a solid training in science and naval practice. Returning to Japan in 1867, he was put in command of the *Kaiyo Maru*, a 26-gun vessel of 400-horse power. The revolution breaking out, and the tycoon being overthrown, E. endeavored to obtain from the United States minister, gen. Van Valkenbergh, the possession of the *Stonewall*, formerly a confederate iron-clad ram built in England, captured by the United States forces, and purchased and paid for by the tycoon's government. Being unsuccessful, E. left the anchorage near Yedo, with the seven war vessels under his charge, and sailed to Hakodadi. Being disowned by his former master, E. declared himself and his forces independent, and set up a republic somewhat after the model of the United States, of which he was elected president. This government continued for several months, but by June, 1869, the land and naval forces of the mikado had reached Yezo, and battles rapidly followed each other at Esashi, Matsumae, and Kikonai. Finally, June 4, the final conflict took place at Hakodadi. The three vessels of E. were opposed to the five flying the mikado's flag, one of which was the iron-clad ram *Stonewall*. A terrific naval battle was kept up during several days, while the land forces were engaged almost continually. The "rebel" fleet and forts were utterly destroyed, chiefly by the iron-clad, and on the 26th, E. and the leaders surrendered. He was kept in prison until 1872, when he was pardoned and given a position in the Kai Takn Shi (department of colonization of Yezo). In 1874, he was made vice-admiral in the imperial navy, and sent to Russia as minister plenipotentiary, negotiating the treaty by which Russia gave to Japan the Kurile islands in exchange for the southern half of Saghalien. See KURODA.

ENOS (anciently, *Ænos*), an ancient t. and seaport of European Turkey, in the province of Adrianople, is situated on a rocky isthmus at the mouth of a gulf of the same name, about 35 m. w.n.w. of Gallipoli. It is the port of Adrianople, and has some trade in wool, camels' hair, cotton, leather, silk, etc. Its harbor is commodious, but so shal-

low, from being choked up with sand, that it admits only small vessels. Pop. 6,000, principally Greeks. The gulf of Enos is about 2¼ m. wide at the entrance, extends into the country for about 14 m., and is on an average 5 m. broad.

The town of E. is very ancient. Virgil mentions it (*Æn.* iii. 18) as being one of the towns founded by Æneas, after the sack of Troy; and Homer also attests its antiquity by alluding to it in his great poem (*Il.* iv. 519).

ENOS, ROGER, 1736–1808; an officer in Arnold's expedition to Quebec, but sent back with his troops for lack of provisions. He was afterwards an eminent citizen of Vermont.

ENRIQUEZ, GOMEZ ANTONIO (properly, ENRIQUEZ DE PAZ), a Spanish poet, the son of a baptised Portuguese Jew, was b. at Segovia early in the 17th century. He entered the army in his 20th year, and rose to the rank of capt.; but in 1636, had to flee the country, to escape the persecution of the Inquisition, which suspected him of a secret leaning to the creed of his father. E. settled at Amsterdam, and latterly professed the Jewish faith; in consequence of which, he was burned in effigy by the pious Catholics of Seville, 14th April, 1660. The date of his death is not known. During his residence in Spain, E. had considerable reputation as a dramatic poet. According to his own account, he wrote 22 comedies, which met with great success on the stage, in consequence of which, several of them passed as Calderon's. *La prudente Abigail; Engañar para reinar; Celos no ofenden al sol;* and *A lo que obligan los celos,* were published under the name of Fernando de Zárate. E's. comedies show him to have possessed much inventiveness, but in other respects they deserve little praise. Among his other writings are *Las Academias morales* (Rouen, 1642), containing some fine elegiac verse; *La Culpa del primer peregrino* (Rouen, 1644), a mystico-theologic poem; *El siglo Pitagórico* (Rouen, 1647), a series of satirical portraits partly in prose and partly in verse; and *El Samson Nazareno* (Rouen, 1656), an abortive epic. For a notice of E. and his writings, see Ticknor's *History of Spanish Literature.*

ENROLLMENT, entry upon a register or record.

Enrollment of Deeds.—In order to prevent the secret transfer of lands which was effected in England by means of a bargain and sale (q.v.), it was provided by 27 Hen. VIII. c. 16, that the deed must be enrolled; but a mode was soon adopted by lease and release of evading that act and attaining the same end. By the fines and recoveries act (3 and 4 Will. IV. c. 74), it is enacted that all transfers of land effected under the provisions of that statute, must be enrolled in the court of chancery within six months after the execution.

Enrollment of Decree in Chancery.—A decree in a suit in chancery did not receive full effect until it had been enrolled. And it used to be a practice to enroll a decree, and so prevent any appeal except to the house of lords. But enrollment after 1876 became useless; and it no longer prevents the usual appeal to the court of appeal in the first instance, and thence to the house of lords. The general rule under the judicature acts is that every decree may be appealed from within a year if final; and within 21 days if interlocutory. All appeals are now by way of re-hearing, and no petition case or other formal proceeding than notice of motion is necessary.

ENSCHEDÉ, a t. in the Netherlands, province of Overyssel, lies about 4 m. from the Hanoverian boundary, and 30 m. w.n.w. of Zutphen. Besides fustians and dimities, cottons for export to Java are largely manufactured. Cotton-spinning, bleaching, dyeing, and calendering also employ many of the inhabitants. There are several benevolent institutions, a Reformed, a Roman Catholic, a Baptist church, a chamber of trade, and grammar-school, in which French, English, and German are taught. In 1870, pop. 52,079.

ENSEMBLE (Fr.), the general effect produced by the whole figures or objects in a picture, the persons and plot of a drama, or the various parts of a musical performance.

ENSIGN was, until 1871, the title of the lowest combatant rank of commisioned officers in the British army, and is derived from their being charged with the duty of carrying the regimental colors or E. (Fr. *enseigne,* Lat. *insigne*). In the hand-to-hand mêlées of the middle ages, the preservation of the colors or standard, as the rallying-point of those fighting under the same leader, was a matter of vital importance, and was only intrusted to the bravest and most trustworthy. The colors were committed to him with imposing ceremony in presence of the assembled regiment, and he had to take an oath to defend them with life and limb, and if need were, to wrap himself in them as a shroud, and devote himself to death. The man who undertook this perilous post received sometimes as much as sixfold the usual pay. It was doubtless in this way that the point of honor arose respecting the colors. History records repeated instances where the oath was kept to the letter. In the modern system of warfare, the regimental colors are seldom exposed to such danger, and the office of E. is of less account. In the infantry, there were two kinds of subalterns below the capt., viz., the lieut. and the ensign. In the cavalry and artillery, the duties of E. were taken by officers who had the titles of cornet or second-lieut. When a gentleman entered the army, he began as an E. (if in the infantry), and from this rank he rose by purchase or seniority. The price of an E.'s commission is stated under COMMISSIONS,

ARMY, as well as the extra price to be paid on rising to the rank of lieut. The pay was 5*s.* 3*d.* per day, and the half-pay 1*s.* 10*d.* to 3*s.*; although it was most unusual for an E. to be on half-pay. An E. in the foot guards ranked as a lieut. in the army, and, on transferring his services to an infantry or cavalry regiment, exchanged with an officer of that grade.

The rank of E. having been abolished in the British army, the number of lieutenants has been proportionately increased; but for three years the officer only receives the same pay as the E. formerly had. The officer enters in the probationary grade of sub-lieut., which is converted to lieut. as soon as he proves himself qualified to command soldiers.

In the late East India company's army, a cadet became an E., in rank and pay, directly he landed in India.

ENSIGN is also the name of one of the flags belonging to the British fleet; and, under that or some other name, to most other fleets. It is a large flag or banner hoisted on an E. staff, a long pole erected over the poop, or at the gaff when the ship is under sail. Its chief purpose is to denote the nation to which the ship belongs. The English E. has for a groundwork one of three colors—red, white, or blue—and bears the union double cross of St. George and St. Andrew, or union-jack (q.v.), in the upper corner next the mast (dexter-chief). The *white* E. is also divided into four quarters by a red cross of St. George, and is limited to ships-of-war. Merchant-vessels are only allowed to carry the *blue* E.; but yachts, if of clubs acknowledged by the admiralty, colonial armed vessels, ships connected with government departments, and merchant-vessels commanded by officers of the naval reserve, are permitted to use the *red* ensign. Formerly, the English admirals required ships of all other nations to dip their ensigns to the English flag; the refusal of the Dutch to comply with this custom, was the signal for one of Blake's bloodiest encounters with Van Tromp.

ENSIGN (*ante*), in the U. S. navy, is the national flag. It is also used in the merchant service to designate the country to which the vessel belongs. There is an officer in the navy called ensign who ranks below master and above midshipman. In the army and the militia an ensign is assigned to each company, his duty being to carry the flag or standard of the company. Sometimes the duty falls to a sergeant.

ENSILAGE, green fodder, preserved for cattle, by a process not unlike that employed in the preparation of sauerkraut. A silo or pit, large or small, is first prepared; usually placed, for convenience of feeding, contiguously to the barn in which cattle are housed. It must be so constructed that the air can be excluded from its contents, and of such form and dimensions as will facilitate their settling into a solid mass, and as, when opened for feeding, will expose to the atmosphere as small a part of the surface as practicable. The construction of a silo 16 to 20 ft. long, 8 ft. wide, and from 15 to 20 ft. deep, is thus described: 12-in. perpendicular walls of hard brick, well laid in cement, with smooth joints. If the ground is sandy or gravelly, the outside of the walls next the earth is covered with a coat of cement, or the walls are filled in behind with clay or clayey earth, to prevent the passage of the air through them. The bottoms are also laid with brick upon the flat in cement. The walls are made so smooth upon their inner sides as to offer no obstacle to the settling and compacting of the food by friction of the sides. The pit may be made either open at the top and covered with a roof, or arched over under ground, with two necks coming up to within one foot of the surface of the ground, through which it is filled. The pit being prepared, the fodder is cut green, when in the best condition, or in bloom, passed immediately through the cutting-machine, to reduce it to uniform short lengths of not more than 1 in., and then deposited and trodden firmly into the pit, sufficient salt being used to render it palatable, but no more. As fermentation—which will commence at once—proceeds, and the mass settles, the cutting and treading in of fresh fodder must be continued from day to day, after an interval of about 36 hours, until the pit is filled and settling has ceased. Then the pit is immediately and thoroughly sealed over the whole top surface of the fodder, by a well-compacted layer of clean fodder, not less than 6 in. thick, excluding the air. Over this layer, some lay planks weighted with heavy stones; others deem this needless. The fodder to be thus treated may be corn, red clover, pearl millet, West India millet, or Guinea corn, green rye, oats, mixed grasses, or any other succulent production of which cattle are fond. Food preserved by this process is greatly relished. It is eaten eagerly and clean, leaf and stalk, without any loss whatever; and stock thus fed exhibit the highest conditions of health and thrift. It is recommended especially for milch cows, as it increases the quantity and improves the quality of milk.

ENSINAL', or ENCINAL, a co. in s.w. Texas, drained by affluents of the river Neuces; 1610 sq.m.; pop. '70, 427. It is a cattle-raising region, and contained, in 1870, 1678 cattle, 5,778 sheep, and produced 9,556 lbs. of wool.

ENTABLATURE, that part of a design in classic architecture which surmounts the columns (q.v.), and rests upon the capitals. It is usually about two diameters of the column in height, and is divided in every style of classical architecture into three parts—architrave, frieze, and cornice. These parts vary in their relative proportions in different styles. In Doric architecture, for example, if the E. be divided into eight equal parts, two of these form the height of the architrave, three that of the frieze, and three

that of the cornice. In the other styles, the relative proportions are as three, three, and four.

The term E. was not used till the 17th c., the members composing it being previously simply designated the cornice, frieze, and architrave.

1. *The architrave* is the horizontal portion which rests immediately upon the abacus of the column. It is usually ornamented with horizontal moldings, with flat spaces or *faciæ* between. The upper molding always projects further than the others, so as to throw off the rain. This molding varies in different styles. In Doric, it is a plain square projection, with small pendants or *guttæ* under the triglyphs. In the other styles, it is generally an ogee or talon molding. These moldings are frequently enriched with leaf ornaments, and in very florid designs the faciæ are also enriched.

2. *The frieze* is the middle portion of the E., between the top of the architrave and the bed of the cornice. In the Doric style, it is ornamented with triglyphs or slight projections, divided by angular grooves into three parts. The spaces between the triglyphs (called metopes) are square, and are either plain or enriched, either with figure-sculpture, as in the Parthenon, or with bulls' heads, pateræ, or other ornaments. In the other styles, the frieze is never cut into portions, but is either left quite plain or ornamented with figure-sculpture or scroll-work. The former is most usual in Greek art, the latter in Roman. In late Roman works, the frieze is sometimes *swelled* or made to project with a curve.

3. *The Cornice* forms the upper portion of the entablature. It is divided into several parts. The lower molding or moldings resting on the frieze are called the bed-moldings —the upper projecting part is called the corona (q.v.), and between the two there are frequently introduced modillions and dentil bands. The bed-molding is generally of an oval or echinus form, and is frequently enriched with the egg and tongue or leaf ornaments. The upper molding of the corona is generally of a *cymarecta* form (see COLUMN, fig. 1), and is often ornamented with lions' heads. These represent the openings through which the rain was at first led off from the roof-gutters, which were cut in the top of this molding, and were retained as ornaments after their original use was discontinued. The corona projects well over the frieze and architrave, and protects them from rain, while at the same time, by its broad shadow, it gives repose and variety of effect to the building. The *soffit*, or under side of the corona, is frequently paneled and ornamented with pateræ.

Origin.—The component parts of the E. are said, with some appearance of truth, to owe their origin to the forms of the construction of the oldest temples. These were of wood, and were put together in the manner most natural for that material. The square beams laid across from post to post are represented by the architrave; the triglyphs of the frieze are copied from the ends of the cross-beams; the cornice is taken from the boarding which covered the rafters and ties of the roof—projected so as to throw off the rain; and the dentils and modillions show the ends of the rafters left uncovered.

Whatever the origin of the E. may have been, it is a remarkable fact, as connected with Greek and Roman art, how persistent the E. was as a feature in the decoration of these classic styles. So long as buildings consisted of one story in height, this was quite natural; but after this simple system was abandoned, and when, as in Roman architecture, series of columns and entablatures were piled one above the other—not used constructionally, but simply applied to the face of the building—the cornice, frieze, and architrave still retained their places and proportions. In the revived Roman art of the 16th c., the E. was used in a manner still further removed from its original purpose. The strict proportions of the various parts were entirely lost sight of. The frieze was increased in height, so as to admit of small windows to light the entresol or mezzanine (q.v.), and in the French and English forms of the renaissance, the various members become still more attenuated and altered from the original design (see RENAISSANCE). But in no modification of classic architecture, however debased, is the E. awanting. The architrave, frieze, and cornice are essential portions of every classic design.

ENTADA, a genus of climbing shrubs of the natural order *leguminosæ*, sub-order *mimoseæ*, having pinnate or bipinnate leaves, and remarkable for their great pods, in which the seeds lie amidst a glutinous or gelatinous substance. The seeds of *E. pursætha*, an East Indian species, are saponaceous, and are used for washing the hair. The plant attains a great size; its pods are sometimes fully 5 ft. long, and 6 in. broad; the seeds are beautiful brown beans, so large that in Ceylon they are often hollowed out and used as tinder-boxes.

ENTAIL, or, as it is frequently called in Scotland, *tailzie*, from Fr. *tailler*, to cut, properly signifies any destination by which the legal course of succession is cut off, one or more of the heirs-at-law being excluded or postponed, and the settlement of land made upon a particular heir or series of heirs. The desire to preserve in our own family land which we have either inherited or acquired, appears to be inherent in the human mind. The first distinct trace of the existence of entails, is to be found in the Roman law. The Greeks, indeed, permitted persons to name successors to their estates, and to appoint a substitute who should take the estate on the failure of him first named. The substitute, as appointed, was permitted to succeed on the death of the institute (as he was called) without leaving issue or without alienating the estate. But this limited

right fell far short of the power of entailing which has since prevailed in various countries. At Rome, under the later emperors, the practice of settling land upon a series of heirs, by means of *fideicommissa* (q.v.), grew up, and was sanctioned by the state. These deeds, which were originally simply a trust reposed in the honor of a friend, to whom the property was conveyed, to carry out the will of the grantor, by degrees received the sanction of the law. In their early form they contained merely a substitution of heirs. Thus, "*Rogo ne testamentum faciat, donec liberos susceperit.*" "*Rogo ut testamento suo Seium hæredem faciat.*" "*Rogo hæredem, ne hæreditatem alienet, sed relinquat familiæ.*"—Heineccius, s. 658. But by the later law, a much fuller form of settlement was admitted, whereby the estate was protected from every sort of alienation. "*Volo meas ædes non vendi ab hæredibus meis, neque fœnerari super eas: sed manere eas firmas, simplices, filiis meis et nepotibus in universum tempus. Si aliquis autem eorum voluerit vendere partem suam, vel fœnerari super eam, potestatem habeat vendere coheredi suo et fœnerari ab eo: si autem aliquis præter hæc fecerit, erit quod obligatur, inutile atque irritum.*"—*Dig.* xxxi. 88, s. 15. Here we have an example of the principal clauses of a strict E. as subsequently more fully carried out in Scotland. It is impossible to doubt that this Roman form must have been adopted by the Scottish lawyers in framing their deeds of entail. The limitation to a particular line of descent, the prohibition to alienate or burden with debt, and the still more peculiar feature of the declaration of forfeiture in case of non-compliance, are to be found in both forms. There are, however, two points in which the Roman law differed from that which prevailed for many years in Scotland—viz., that the former did not recognize the right of primogeniture, and that the limitation of the deed was restricted to four generations. For the right of primogeniture, as recognized in deeds of E., we are indebted to the feudal law. That system, which has united with the civil law to form a basis for the codes of modern Europe, did not, in its original form, recognize the right of a holder of land to alienate his feudal benefice. But the right of the eldest son to represent his father, both in the duties and privileges of the fief, if not an original principle of the system, was universally recognized in the days of its greatest power. We shall presently see how this principle was embodied in a Scottish deed of entail. We come now to consider entails as they have existed in modern nations.

In England, the Saxons, it is said, prohibited the alienation of lands by those who had succeeded to them under condition that they should not alienate.—Wilkins's *Leges Saxonicæ*, p 43 (note). Among the Saxons, the law of primogeniture was not recognized. But on the establishment of the feudal laws in England, a practice began to prevail whereby an estate was settled upon a particular series of heirs, as "to a man and the heirs of his body." This is the first germ of an entail in England. It was called a fee-simple conditional, because the judges refused to recognize an absolute limitation of the estate to a particular line of heirs, but held the destination to be conditional on the birth of an heir, and that that condition having been purified, the donee was free to alienate the estate. The common law thus refusing to recognize entails, a statute was passed which had the effect of introducing that practice into England. This was the famous statute *De Donis* (q.v.), whereby it was declared that the estate should be held *secundum formam doni*. In order to the creation of an entail under this statute, it was not enough that the estate was limited to "a man and his heirs," as those words were held to constitute an estate in fee; it was necessary that the estate should be given to "a man and the heirs of his body," or "to a man and the heirs of his body by his wife Joan." The former was called a general, the latter a special entail. Another form whereby lands might be entailed under the statute *De Donis*, was by settlement in Frank-marriage (q.v.). For nearly 200 years after the passing of this act, lands settled in the form which it prescribed continued to be held under the fetters of a strict entail. But the tendency of the law, which in Scotland, as we shall presently see, was to strengthen the power of entails, was, in England, in the opposite direction. For a long time, tenants in tail, taking advantage of legal technicalities, were able practically to defeat the limitation in tail by means of a discontinuance. But it was not till the time of Edward IV. that an effectual means of evading the provisions of the act was brought into use; this was achieved by means of a process called a common recovery. See FINES AND RECOVERIES. By this process, a tenant in tail could bar the E., and convert the estate into a fee-simple. Another mode of barring an E. was by means of a fine (q.v.). It had been declared by the statute *De Donis*, that levying a fine of lands should be no bar to the E.; but by 32 Hen. VIII. c. 36, it was enacted that a fine of lands, when duly levied, should be a complete bar to the tenant in tail, and those claiming under him. It is to be observed that the operation of a fine was confined to those claiming under the tenant in tail: those who had rights of reversion or remainder under the grantor of the E. were not excluded by this species of assurance; so that by means of a recovery only could an estate tail be converted into a fee-simple. From the introduction of common recoveries till the passing of the fines and recoveries act (3 and 4 Will. IV. c. 74), a period of more than 300 years, it was impossible that an estate could be held under the fetters of an E., if the tenant in tail and the next heir chose to combine to defeat the entail. By the fines and recoveries act, the technicalities formerly necessary in order to bar an E. were removed, and tenant in tail may now, by a simple conveyance, alienate his estate at pleasure. An estate tail is a freehold of a limited

description. Tenant in tail may commit waste (q.v.). Formerly, an estate tail was not liable to the debts of the tenant, but by 1 and 2 Vict. c. 110, this restriction has been removed. Copyhold lands have been held not to fall under the operation of the statute *De Donis*. A limitation, therefore, which in a freehold creates an estate tail, in copyhold lands creates a fee-simple conditional, according to the old common law, except where the custom of the manor is to the contrary.

In Scotland, as in England, entails appear first to have taken their rise from the feudal usages. It has been observed by lord Kames, that while the feudal system was in its vigor, every estate was in fact entailed, because no proprietor had any power to alter the order of the succession. But when the stricter feudal principles gave way, and the power of alienating land began to be recognized, the holders of estates sought to secure, by deed, in their own families the lands which they possessed. The form first adopted for this purpose was the simple destination, whereby the estate was simply limited to a particular series of heirs, without prohibition to alienate, or declaration of forfeiture for contravention of the will of the grantor. In this form, the deed must have resembled the early English entails. The feudal law of primogeniture having been received as a principle of common law, the estate would naturally descend from father to son in the line indicated by the deed. But, as it was held that those succeeding under this deed were not restrained from alienating, the practice of adding prohibitory clauses was introduced. Entails in this form were held to bind the heir from granting gratuitious alienations; but he was not restrained from selling the estate, or burdening it with debt. Early in the 17th c., a further addition was made to the form of the deed by the introduction of irritant and resolutive clauses, i.e., clauses declaring the act of alienation to be null, and to infer the forfeiture of the estate. The form thus adopted, which resembles closely the form of the Roman deed already noticed, was fortified by a decision of the court of session in the Stormont E., M. 13,994, holding that an estate so protected could not be attached by creditors. This decision created much difference of opinion amongst lawyers as to the power of the grantor thus to protect an estate from the onerous act of the heir, in consequence of which the famous Scotch E. act, 1685, c. 22, was passed, by which it was enacted that an estate conveyed by a deed fortified by prohibitory, irritant, and resolutive clauses, and recorded in a particular register, should be effectually secured in the line of destination. This act has always been most strictly viewed by Scottish lawyers; and entails which have been found deficient in any of the prescribed requisites, have been regarded by the courts as utterly ineffectual. The first lord Meadowbank, in a judgment which has always been regarded as a leading authority, laid it down that entails "are the mere creatures of statute," and that where the interests of third parties are concerned, every part of an E. is liable to the strictest interpretation (*Hamilton* v. *Macdowall*, 3d Mar., 1815). The operation of the old E. act was found, notwithstanding, to be of the most oppressive character. Statutes were in consequence passed from time to time, empowering heirs of E. to exercise larger powers of ownership than could be granted under the act 1685, and to make provisions for their families. At length, by 11 and 12 Vict. c. 36, and 38 and 39 Vict. c. 61, the power of fettering lands by a strict E. has been finally destroyed. By this act, heirs under an existing E. may disentail, with the consent of certain heirs next in succession; and in all entails made after 1st Aug., 1848, and also in old entails where the heir in possession was born since 1st Aug., 1848, the heir of E. in possession may, by means of a simple deed of disentail, free his estate from the restrictions of the entail.

In America, before the rebellion, the English law as to estates tail prevailed. But in the United States the law of entails has been gradually abandoned by the several states; and property can now be fettered, to a limited extent only, by means of executory devices (q.v.). In France, the power of creating entails has varied much at different periods, from the right to make a perpetual E., which appears to have been the original principle, to a limitation to four, and at one time to two degrees. But by the code Napoleon, ss. 896–897, entails are now absolutely prohibited. In Spain, also, entails, which were permitted under certain restrictions, have been entirely abolished by a law of the cortes in 1820. Thus it will be seen that the right of securing land in a particular family, which commends itself to the natural feelings, has been found so oppressive in operation, and so injurious to the public interest, that after an existence of more than 600 years it has been practically discarded almost simultaneously by the general consent of modern nations.

ENTAIL, or **ENTAYLE** (Fr. *tailler*, to cut), often used by old English authors for any architectural ornament which is sculptured or cut in stone. Chaucer speaks of

"An image of an other entaile;"

and other examples are given by Parker (*Glossary of Architecture*).

ENTASIS (Gr.), the swelling outline given to the shaft of a column (q.v.).

ENTELLUS MONKEY, or HONUMAN (*semnopithecus entellus*), an East Indian species of monkey, with yellowish fur, face of violet tinge, surrounded with projecting hairs, long limbs, and very long muscular and powerful—though not prehensile—tail. It is held in superstitious reverence by the Hindus, and is often to be seen exhibiting much impudent familiarity in the precincts of temples; indeed, temples are often specially

dedicated to it; hospitals are erected for its reception when sick or wounded. Hindu laws affix a far more severe punishment to the slaughter of one of these sacred monkeys than of a man; the peasant esteems it an honor when his garden is plundered or his house robbed by troops of them, and would consider it an act of the greatest sacrilege to drive them away. They take their places with perfect confidence on the roofs of houses, and gaze at the passing crowd. This is one of the very few species of monkeys found in the northern provinces of India, and in summer ascends the Himalaya to the pine-forests, and almost to the snow-line; it has even succeeded in crossing the mountains, and occurs in Bhotan.

ENTERI'TIS (Gr. *enteron*, the intestines), inflammation of the bowels, and especially of their muscular and serous coat, leading to constipation (q.v.) and pain, with colic (q.v.), and sometimes ileus (q.v.). E. is distinguished from these last affections, indeed, only by the presence of inflammatory symptoms—i.e., pain, tenderness, fever, etc., from a very early stage of the disease, and in so decided a form as to require special attention. If E. does not depend upon mechanical obstruction, it may be combated by hot fomentations, with moderate leeching and counter-irritation, and the internal administration of opium. Injections of warm water, or of asafœtida and turpentine (see CLYSTER), should be at the same time given to clear the lower bowel; and all purgatives, except in some cases castor oil, should be avoided. The disease is, however, one of great danger, and should never be incautiously treated with domestic remedies. It is closely allied to peritonitis (q.v.), and often depends upon internal mechanical causes, or on external injury.

In the Lower Animals.—Inflammation of the bowels, among the heavier breeds of horses, generally results from some error of diet, such as a long fast, followed by a large, hastily-devoured meal, indigestible or easily fermentible food, or large draughts of water at improper times. When thus produced, it is frequently preceded by stomach staggers or colic, affects chiefly the mucous coat of the large intestines, and often runs its course in from eight to twelve hours. With increasing fever and restlessness, the pulse soon rises to 70 or upwards, and, unlike what obtains in colic, continues throughout considerably above the natural standard of 40 beats per minute. The pain is great, but the animal, instead of recklessly throwing himself about, as in colic, gets up and lies down cautiously. Respiration is quickened, the bowels torpid. Cold sweats, stupor, and occasionally delirium, precede death. When connected with, or occurring as a sequel to influenza, laminitis, and other complaints, the small intestines are as much affected as the large, and the peritoneal as well as the mucous coat of the bowels. This form is more common in the lighter breeds. When the patient is seen early, whilst the pulse is still clear and distinct, and not above 60, and the legs and ears warm, blood-letting is useful, as it relieves the overloaded vessels, and prevents that exudation of blood which speedily becomes poured out in the interior of the bowels. This disease should be treated as follows: In a pint of oil, or an infusion of two drams of aloes in hot water, give a scruple of calomel and an ounce of laudanum, and repeat the calomel and laudanum every hour in gruel until the bowels are opened, or five or six doses are given. Encourage the action of the bowels by using every half-hour soap and water clysters, to which add laudanum so long as pain and straining continue. If the animal is nauseated and stupid, with a cold skin, weak quick pulse, bleeding and reducing remedies are very injurious; and the only hope lies in following up one dose of the calomel and aloes with small doses of laudanum and sweet spirit of niter, or other stimulants, repeated every forty minutes. In all stages, woolen cloths wrung out of hot water and applied to the belly encourage the action of the bowels, and relieve the pain.

E. in cattle is mostly produced by coarse wet pasture, acrid or poisonous plants, bad water, and overdriving. The symptoms are fever and thirst, a quick but rather weak pulse, restless twitching up of the hind limbs, tenderness of the belly, and torpidity of the bowels. Calves generally die in three or four days, other cattle in a week or nine days. Bleed early, open the bowels with a pint of oil and a dram of calomel, which may be repeated in eight or ten hours, if no effect is produced. Give every hour fifteen drops of Fleming's tincture of aconite in water, until six or seven doses are given. Allow only sloppy and laxative food, such as treacle, gruel, or a thin bran mash; employ clysters and hot cloths to the belly, and use two ounce doses of laudanum if the pain is great. E. in sheep mostly occurs in cold exposed localities, and where flocks are subjected to great privations or improper feeding. The symptoms and treatment resemble those of cattle.

ENTERPRISE, the seat of justice of Volusia co., Fla., on St. John's river and lake Monroe; 205 m. from Jacksonville, at the head of steam-boat navigation. It is a popular winter resort for northern visitors; has sulphur springs, and good hotels.

ENTOMOLOGY (Gr. *entomon*, an insect, *logos*, a discourse), the science which has insects (q.v.) for its subject. The mere collector of insects may be one of the humblest laborers in the great field of natural history, but his labors contribute materials for the more philosophic naturalist who studies the structures of these creatures, and compares them with one another according to the unity and the variety of design which they exhibit. And when we begin to take into account the vast number of different species of insects, their great diversities of structure and of habits, their great complexity of organization,

the wonderful transformations which many of them undergo at different stages of their existence, and the equally wonderful but extremely various instincts which many of them display, we find E. to be a science worthy to engage the noblest mind. But besides all these things, we must remember that insects serve most important purposes in the general economy of nature; and that some of them are directly useful to man, some directly injurious, at least when their numbers are at any time excessively multiplied.

E., along with the other branches of natural history, was cultivated by Aristotle and other Greeks. Aristotle is the most ancient author of whose works anything relating to this science now remains. Pliny has little on this subject but what is copied from Aristotle; and it can scarcely be said to have been again studied as a science till the 16th c., when attention began once more to be directed to it, although it was not till the 17th c. that much progress was made, or that any important works on E. appeared. Insects then began to be described, not only those of Europe, but also some of the curious and splendid insects of tropical countries; bees and other insects of particular interest received attention; the metamorphoses of insects began to be studied, and their anatomy to be investigated. The names of Goedart, Malpighi, Swammerdam, Leuewenhoek, and Ray deserve to be particularly mentioned; but the infant state of the science may be illustrated by the fact, that about the end of the 17th c., Ray estimated the whole number of insects in the world at 10,000 species, a number smaller than is now known to exist in Britain alone. In the 18th c., the name of Linnæus occupies as high a place in the history of E. as in that of kindred branches of science. The progress of the science was much promoted by his arrangement and exhibition of the discoveries of previous and contemporary naturalists; and by his system of classification, founded on characters taken from the wings, or their absence, a system professedly artificial, yet so harmonizing with the most natural distribution into groups, that some of its orders were indicated by Aristotle, and that it has retained and seems likely to retain its place, modified, indeed, but not essentially changed. De Geer and Fabricius are perhaps, after Linnæus, the most worthy to be named of the great entomologists of the 18th century. At the close of the 18th and beginning of the 19th c., the name of Latreille is pre-eminently conspicuous; and in the year 1815, a new impulse began to be given to the study of E. in Britain by the publication of the admirable *Introduction to Entomology* of Messrs. Kirby and Spence, a work combining in a remarkable degree the merits of being at once popular and scientific. Since the beginning of the 19th c., the number of insects known and described has prodigiously increased; many entomologists have with great advantage devoted themselves particularly to the study of particular orders of insects; and many valuable monographs have appeared. Entomological literature has now become very extensive. The progress of the science has owed not a little to entomological societies, of which the entomological society of London may be particularly mentioned. We cannot attempt to enumerate the distinguished entomologists of the 19th c., but perhaps the names of Leach, Macleay, Curtis, Stephens, Westwood, Smith, Walker, Stainton, Swainson, and Newman, deserve particular notice among those of Britain; Meigen, Jurine, Gyllenhal, Gravenhorst, Hubner, Dufour, Boisduval, Erichsen, and Lacordaire among those of the continent of Europe; and Say among those of America. It is to be regretted that we have not yet any complete work on the insects of Britain. The *Insecta Britannica*, of which some volumes by different authors have been published under the auspices of the entomological society, is intended to supply the want.

ENTOMOL'OGY. See INSECTS, *ante*.

ENTOMOS'TRACA (Gr. insect-shells), a term introduced by Müller, and adopted by Latreille, Cuvier, and other naturalists, to designate the second of their two great divisions of crustaceans (q.v.). The number of species of E. is very great. They are all of small size, except the king-crabs (*limulus*), which in many respects differ from all the rest, and have recently been formed by some naturalists into a sub-class of crustaceans by themselves. Many of them are minute, and exist in great numbers both in fresh and salt water, particularly in stagnant or nearly stagnant fresh water, affording to many kinds of fishes their principal food. They differ very much in general form; the number of organs of locomotion is also very various—in some very few, in some more than 100—usually adapted for swimming only, and attached to the abdominal as well as to the thoracic segments; but there never is a fin-like expansion of the tail, as in some of the malacostracous crustaceans. The antennæ of some are, however, used as organs of locomotion. Some of the E. have mouths fitted for mastication, and some for suction. Not a few are parasitic. The heart has the form of a long vessel. One or two nervous knots or globules supply the place of a brain. The organs of respiration are in certain species attached to some of the organs of locomotion, in the form of hairs, often grouped into beards, combs, or tufts, or blade-like expansions of the anterior legs are subservient to the purpose of respiration: in others, no special organs of respiration are known to exist. The eyes are sometimes confluent, so as to form a single mass—one eye—in the front of the head. The name E. has been given to these creatures in consequence of most of the species having shells of one or two pieces, rather horny than calcareous, and of very slender consistence, generally almost membranous and transparent. In

very many, the shell consists of two valves, capable of being completely closed, but which, at the pleasure of the little animal, can also be opened so as to permit the antennæ and feet to be stretched out.

The study of the smaller crustaceans has recently been prosecuted with great assiduity and success, by Milne-Edwards and others; and in consequence of the great differences existing among them, new classifications have been proposed, and the name E. has by some been restricted to those which have a mouth formed for mastication, but no special organs of respiration, forming a section which is subdivided into two orders, *ostracoda* and *copepoda*, the former having a bivalve shell or shield, the latter destitute of it.—But the name E. is still commonly employed in its former wider sense.

ENTOMOSTRACA, Fossil. E. attained their maximum size in the palæozoic waters, which they tenanted in vast shoals. The Silurian trilobite (q.v.) was a phyllopod, and the pteregotus of the old red sandstone was nearly allied to the modern limulus. Small bivalvular species are found in all strata, sometimes, as at Burdie-house, near Edinburgh, forming layers of considerable thickness, at others scattered in enormous numbers in the dried sediments of lakes, as in the fresh-water clays of the Wealden, or forming in some places a large proportion of chalk, with the multitudes of their thin calcareous coverings.

ENTOPHYTES (*Entophyta;* Gr. *enton*, within, and *phyton*, a plant), a term usually employed to denote those parasitic plants which grow on living animals. It is seldom extended to vegetable parasites which grow on living vegetables, whether on external or internal parts, nor is it restricted to those which are found in the internal cavities, or within the substance of animal bodies, but includes all which have their seat on living animal tissues. It does not, like the analogous term *entozoa*, denote any particular class of organized beings; some of the E. are *algæ*, and some *fungi*, but to these two orders they are limited, and all of them belong to the lower sections of these orders; some of them to those lowest sections in which the distinguishing characters of the two orders cannot easily be traced, so that they are referred to the one or the other on very slender grounds; those in which a coloring matter is present being reckoned algæ, although it can be observed only in masses of aggregated cells, and not in the cells when viewed separately, and those which even in the mass appear entirely colorless, being considered fungi. Many of the algæ and fungi parasitic on plants are nearly allied to those which occur on animals; thus, ergot and the kind of mildew which has proved so destructive to vines, are referred to the same genus (*oidium*) to which is also referred the fungus found in the diseased mucous membrane in cases of *aphthæ* or *thrush:* and another genus (*botrytis*, q.v.) contains the fungus called muscardine, or silkworm rot, so destructive to silkworms, together with the fungus which accompanies or causes the potato disease, and many other species which infest plants. Common mold is even supposed to occur on animal tissues tending to decay, during life, as well as on dead animal and vegetable substances.

Vegetable parasites occur both in man and in the lower animals; not a few of them are peculiar to fishes, and more are peculiar to insects than to any other class of animals. The fungi which grow on the bodies of insects sometimes attain an extraordinary development: *sphæria Sinensis*, which grows on a Chinese caterpillar, and to which medicinal virtues, probably imaginary, are ascribed in China, attains a length greater than that of the caterpillar itself. A similar species (*S. Robertsii*) is found on the caterpillar of a New Zealand moth.

The situations in which E. occur are very various. Some, like the thrush fungus already noticed, appear in diseased conditions of the mucous membrane; some find their place in the lungs, the ear, or other organs; some on the skin, in the hair follicles, and *in* as well as *on* the hair itself. The "fur" which appears on the tongue when the stomach is disordered, abounds in the extremely slender unbranching threads of the alga called *leptothrix buccalis*, which also vegetates luxuriantly in cavities and corners of the teeth not sufficiently visited by the tooth-brush. The lungs of birds, the gills of fishes, the intestines of insects, the wing-covers of beetles, the eggs of mollusks, all have their peculiar vegetable parasites by which they are sometimes infested.

It is often by no means easy to say whether the presence of E. is to be regarded as the consequence or as the cause of disease; sometimes it may be both. Sometimes it appears to be certainly a consequence, as when the *sarcina* (or *merismopæ*) *diaventriculi* occurs in the contents of the stomach and bowels; sometimes, as in the diseases called *favus, porrigo, tinea, herpes tonsurans, plica polonica, mentagra, pityriasis versicolor*, etc., it seems entitled to be regarded as the cause of the diseased state, and the cure of the disease seems to be accomplished by killing the parasite, often a thing of no little difficulty.

Whence the germs of E. are derived is often a question to which it would not be easy to find an answer. Their spores are extremely minute; but there are no plants which produce seeds or spores more abundantly than some of them do; the growth of the plants themselves is very rapid, and reproduction is "very intense and rapid."

It has sometimes been imagined that epidemic diseases may be caused by spores of E. conveyed through the air; no evidence has, however, been produced to render this

opinion probable. An attempt was made to establish the existence of cholera fungi or algæ, but it completely failed.

ENTOZO'A. This term is applied to all the animal forms which live either in the natural cavities (as, for example, the intestinal canal), or in the solid tissues (as, for example, the liver) of other animals. The number of these parasites is so great (there being at least 20 distinct species of worms found in man, 14 in the dog, 15 in the horse, 11 in the common fowl, etc.), and their occurrence so frequent, especially in some of the lower animals, that we must regard their presence, at all events in many species, rather as the normal condition, than as a morbid state due to accidental causes.

It is worthy of notice, that many of the animals included amongst the E. only enjoy a parasitic existence during a part of their total life, which often, as in the well-known case of perfect insects, presents very varied and distinct phases. Thus, for example, the larvæ of the gadfly (*œstrus equi*) undergo their entire development in the stomach of the horse, attaching themselves by minute hooks to the gastric mucous membrane; they then detach themselves, pass along the intestines, and in due time are discharged, and undergo their further changes externally; and many similar instances might be quoted. For this reason, and additionally because parasites are now known to belong to various classes of animals, we no longer attempt, like Linnæus and Cuvier, to form a special group of E.; and a reference to the *vermes intestinæ* in the *systema naturæ*, or to the *entozoaires* in the *règne animal*, at once shows that these illustrious naturalists grouped together animals with few or no true natural affinities.

Although most E. belong to the class of *vermes*, or *worms*, this, as has been already observed, is by no means exclusively the case. Thus, even fishes may lead a parasitic existence; a fish of the genus *fierasfer* being frequently found in the respiratory cavity of the *holothuria tubulosa*, or *sea-cucumber*, and small fishes having been frequently observed in the cavity of the *asteria discoïdes*. Amongst the crustaceans, instances of parasitism are by no means rare; different species of *lernæa* being abundant in the branchial (or gill) cavity, and on the surface of numerous fishes, while the *linguatulæ* infest mammals, reptiles, and fishes, being found in the olfactory sinuses, the larynx, the lungs, the peritoneal cavity, etc. The instances in which mollusks are found to live parasitically are few; certain gasteropods, however, inhabit the bodies of echinoderms, holothurias, and comatulas; and amongst the lamellibranchiates, species of modiolaria and mytilus live in the bodies of ascidians. There are several cases of polyps which have been observed to adopt a parasitic existence; and finally, various protozoa are not unfrequently met with in the animal fluids; for example, certain species of *vibrio*, *cercomonas*, and *paramecium*, have been found in the intestinal evacuations in cholera and diarrhea; *monads* have been found in the urine in cholera, and certain infusoria and rhizopoda in the blood of the dog, the frog, and many other animals. See HÆMATOZOA.

The more common kinds of E. appear to have attracted the notice of the earliest physicians and naturalists whose opinions or works have reached us. Hippocrates speaks of several worms, especially the tæniæ and ascarides, infesting the human intestinal canal; and Pythagoras learned in India that the bark of the pomegranate acted almost as a specific in cases of tape-worm. Aristotle noticed both the tape-worm of the dog and of man, and the *cysticercus cellulosæ* (see CESTOID WORMS) of the pig; but utterly unconscious that the cysticercus, under favorable conditions, became developed into a tape-worm (see TAPE-WORM), referred the origin of all intestinal worms to spontaneous generation—a doctrine that seems to have been generally adopted till the 17th c., when Redi published (in 1684) a work on helminthology, in which he distinctly showed that the generation of various E. followed the same laws as in higher animals, and that in many instances there were distinct males and females. The great recent discovery, that the vesicular or bladder-like parasites, such as the different species of cysticercus and cœnurus, are cestoid worms in an early stage of development, is alluded to in CESTOID WORMS, and will be more fully noticed in the article TAPE-WORM.

Another point of general interest in connection with E. is the part of the body in which they are found. While most live in the intestinal canal and other open cavities (as the larynx, bronchial tubes, etc.), others are found in the closed cavities and in the parenchymatous tissue of the liver and other solid organs. Thus (confining our remarks to the E. occurring in man), *anchylostoma duodenale*, *strongylus duodenalis*, *two species of ascaris*, *oxyuris vermicularis*, *trichocephalus dispar*, *distoma heterophyes*, at least four species of *tænia*, and *bothriocephalus latus*, have been found in different parts of the intestinal canal; while *strongylus gigas* inhabits the kidney, another species of *strongylus* the lungs, a species of *spiroptera* the bladder, two species of *filaria* and *monostoma lentis* the eye, *trichina spiralis* the voluntary muscles, two species of *echinococcus* and *cysticercus cellulosæ*, various parenchymatous tissues, two species of *distoma* the gall-bladder, another species the portal vein, and the *filaria medinensis*, or *guinea worm*, the subcutaneous tissue.

Davaine, who may be regarded as one of the highest living authorities on this subject, gives the following synopsis of the E. occurring in man and the domestic animals (see his *Traité des Entozoaires*, Paris, 1860).

TYPE I. PROTOZOA, including the genera *bacterium, vibrio, monas, cercomonas, trichomonas, paramecium.*

TYPE II. CESTOIDEA, including the families of *tæniadæ* and *bothriocephalidæ.* The *tæniadæ* occur (1) in their undeveloped, cystic, or vesicular form, constituting the genera *cœnurus* and *cysticercus;* and (2) in their perfect, ribbon-like shape, constituting the genus *tænia,* of which about 20 species have been described. The *bothriocephalidæ* contain the single genus *bothriocephalus,* which embraces various species. Their early or vesicular stage has not yet been described.

TYPE III. TREMATODEA, including two well-marked secondary types: (1) The *polystomidæ,* which live as epizoa on the skin or gills of aquatic animals, and which do not concern us here; and (2) the *distomidæ,* including the genera *monostoma, distoma, holostomaa, amphitoma,* with the doubtful genera of *tetrastoma* and *hexathrydium.*

TYPE IV. ACANTHOCEPHALA, with the single genus *echinorhynchus.*

TYPE V. NEMATOIDEA. Passing over two cases in which these worms have been discovered, apparently in their larval or imperfectly developed state (once by Rainey in the human trachea, and once by Vulpian in the kidney of the dog), Davaine gives the following genera, *oxyuris, ascaris, spiroptera, trichina, trichosoma, trichocephalus, filaria, dochmius, sclerostoma, strongylus, anchylostoma, dactylius.*

TYPE VI. ACANTHOTHECA, including the genus *pentastoma.*

Alarming as the above list may seem, comparatively few of the worms contained in it do in reality give rise to dangerous or severe symptoms. It seems to be a condition of parasitism, that the animal upon which the parasite lives must not be destroyed by it; and it has been suggested by one of our highest authorities on this subject, Van Beneden, that in many cases the parasite does not so much attack the organism in which it exists, as its superabundant products. Dujardin and other helminthologists have described cases in which worms were developed by thousands in persons apparently in good health. The symptoms occasioned by ascarides, tæniæ, etc., are described in the articles ASCARIS, TAPE-WORM, etc.

The multiplication of worms is most rapid in debilitated persons, especially children living in cold and damp situations; and impure water, unripe fruits, and raw or imperfectly cooked meat, have considerable influence on the development of these animals. For the description of the medicines used for their destruction, see the article VERMIFUGES; and for information regarding the structure and habits of the most important E., see the articles ASCARIS, BOTHRIOCEPHALUS, CESTOID WORMS, GUINEA-WORM, MONOSTOMA, NEMATOIDEA, STRONGYLUS, TAPE-WORM, THREAD-WORMS, TREMATODA, TRICHINA SPIRALIS, TRICHOCEPHALUS.

ENTR'ACT, in music, is an instrumental piece, composed in the form of a little symphony or overture, to be performed between the acts of a play.

ENTRÉ DOURO E MINHO, or, as it is frequently called, MINHO, a province of Portugal, in the extreme n.w. of the country, is bounded on the n. by Galicia, from which it is separated by the river Minho; on the e. by Galicia and Trasos Montes; on the s. by the province of Beira, from which it is separated by the river Douro; and on the w. by the Atlantic ocean. It has an area of about 2,810 sq.m., and a pop. (1874) of 1,018,690. It has been called the paradise of Portugal, and indeed it may be doubted whether any territory in Europe of equal extent exhibits so much beauty. It is traversed from n.e. to s.w. by three mountain-ranges, which, however, sink down as they approach the coast, leaving a considerable tract of undulating country along the sea-margin. The chief rivers, besides those already mentioned as forming the northern and southern boundaries of the province, are the Lima—a portion of the vale of which is said to form the loveliest landscape in the world—the Cavado, and the Tamego. The climate is agreeable and healthy. The chief productions are wine, oil, flax, maize, wheat, barley, oats, and vegetables. Wine, which is shipped at Oporto, is largely exported. Along the coast are numerous fisheries, at which great numbers find employment. The province of Minho consists of three districts, Braga, Vianna, and Porto.

ENTREMETS, ENTRÉES, French terms now used in England to designate certain courses of dishes served at fashionable dinners. The chief dishes are *entrées,* and the lighter dishes are *entremets.*

ENTRE RI'OS (the Spanish for *between rivers*) takes its name from its occupying the space between the Parana and the Uruguay. It is one of the states of the Argentine confederation. The area is estimated at from 30,000 to 40,000 sq.m., and the population, in 1869, at 134,271 inhabitants. The country is almost entirely pastoral—its principal productions being hides, horns, tallow, and jerked beef. The soil is not well fitted for cultivation, for, besides being rather swampy throughout, it is subject, in the south, to annual floods. The capital is Concepcion del Uruguay, with a pop. of 6,500.

ENTRESOL is a low story between two main stories of a building (generally between the ground floor and the first story), or between two portions of one story, when certain rooms are of greater height than the others upon the same floor. The rooms in the E. are called *entresols* or *mezzanines.*

ENTRO'PIUM, or ENTROPION (Gr. *en,* in, and *trepō,* I turn), inversion of the eyelashes, or even eyelid, consequent either on loss of substance, or on inflammatory

swelling of the lid. If confined to one or two eyelashes, they should be plucked out by the roots, and the bulbs should be cauterized; but the radical cure of severe entropium requires a careful adaptation of the surgeon's art to the circumstances of the particular case, and should not be attempted by unskilled hands.

ENTRY, RIGHT OF. A person is said, in English law, to have a right of entry who has been wrongfully dispossessed or ousted of land and tenements by abatement, intrusion, or disseisin. See the several articles under these heads. A right of entry was formerly lost by suffering a descent cast, i.e., where the tenant tortiously in possession is permitted to continue unmolested till his death, and is succeeded by his heir. This result of suffering a descent cast is removed, 3 and 4 Will. IV. c. 27, and right of entry is now lost by not asserting it for twenty years.

ENTRY OF AN HEIR. In the feudal law of Scotland, this term was applied to the recognition of the heir of a vassal by the superior or dominus. Strictly, the whole rights of the vassal in the property return to the superior on his death, and must be renewed to his heir. The renewal, however, is not optional; it is merely an occasion of exacting dues of entry from the heir, which tend, of course, to diminish the value of the property, and of putting fees into the pockets of conveyancing lawyers, who are the only real gainers by the arrangement. See CONVEYANCING.

ENVELOPES. Until the introduction of the penny-postage system, E. for written letters were very little adopted; it was far more customary to secure, by wafer or sealing-wax, the sheet of paper on which the letter was written. When the postage was rendered uniform for all distances, and prepayment enforced, or at least recommended, it was supposed that stamped E. would be convenient coverings for letters, sealing the letter and paying the postage at one operation. Such has indeed been the case; but the envelope-manufacture has since taken a new direction, and to an extent that no one could have contemplated. Several large firms in London and elsewhere can make E. more cheaply than the government, and can vary the size, shape, color, and quantity to an indefinite degree; as a consequence, although E. bearing the government impressed stamp are stilll in demand, the unstamped varieties are used in very much larger quantities. They are made by two methods, involving different amounts of machine-power. The paper is first cut into quadrangular pieces rather longer than wide, by a cutting blade brought to bear upon a pile of sheets at once; and then cutting-dies reduce these pieces to the proper shape, generally lozenge or diamond form, but sometimes with curvilinear edges. For some kinds, it is found to economize both time and paper to stamp the pieces out at once from the rough sheets. The subsequent folding and gumming are performed generally by hand, sometimes by machine. In the hand-method, women and girls fold with almost incredible quickness, having very simple guide-pieces to aid them in giving the proper oblong quadrangular shape to the fold. The gum is applied with a small brush, either along the overlapping edges, or in spots here and there, according to the quality of the envelope.

The envelope-machines, however, such as those of Messrs. De la Rue, are beautiful examples of automatic mechanism. In the kind invented and used by this celebrated firm, a cutting-machine severs the blanks or papers; and dies are employed to stamp the device on the spot where the seal would otherwise lie. The blanks are then fed into the folding-machine, where they pass through a curious series of processes. Each blank is carried down into a box, where a plunger makes four creases in it; two short levers fold down two of the flaps thus made; a gumming apparatus comes up, and applies a line of wet gum to each flap-edge; two small levers then fold down the other two flaps (but only fastening one of them); and finally, the envelope is shifted aside to a pile, and makes way for another. All these processes are gone through in *one second*, enabling the machine to make 60 E. per minute. Where 12 of these machines are working at once, it will be seen that a million E. are put out of hand in a very short time. Nearly a million and a half of enveloped letters pass through the post every *day* in the United Kingdom, most of the E. for which are of home manufacture; and besides this, a large export trade is maintained. The stamped E. all go to Somerset house, to have the stamp impressed upon them, which is done by a beautiful machine, chiefly invented by Mr. Edwin Hill, in which embossing and color-printing are ingeniously combined. These E. are sold by the stamp-office, between which and the post-office a monetary adjustment becomes necessary.

ENVOY, a diplomatic minister of the second order, i. e., inferior in rank to an ambassador. Envoys ordinary and extraordinary, ministers plenipotentiary, the internuncios of the pope, and all other inferior diplomatic ministers, differ from ambassadors in this, that although they receive their credentials, like ambassadors, immediately from their sovereign, they represent not his personal dignity, but only his affairs. They stand to him just as an ordinary agent does to his principal, and their acts or promises are his in a business, though not in a personal sense. It is said that this class of diplomatists was first introduced by Louis XI. of France, towards the end of the 15th century. The E. is superior in rank to the chargé d'affaires, whose credentials proceed from the ministers of the state from which he is sent, and are addressed to the minister of the state to which he is sent; or are a mere delegation from an ambassador

or E. to conduct the affairs of the mission in his absence. Consuls (q.v.) are not generally reckoned among diplomatic ministers, though, where they have diplomatic duties to perform independently of an ambassador or E., they are accredited, and treated as ministers. According to the division of diplomatic agents into four classes, which was made by the great powers at the congress of Vienna in 1815—viz.: 1. Ambassadors, legates, and nuncios; 2. Envoys, ministers, and other agents accredited to sovereigns; and 3. Chargés d'affaires, accredited by and to the departments of foreign affairs—an E. would be of the second, and a chargé d'affaires of the third rank. But the practice of this country has interjected between the ambassador and the E. a second class, called envoys extraordinary and ministers plenipotentiary, which, of course, throws the ordinary E. into the third, and the chargé d'affaires into the fourth class. See CHARGÉ D'AFFAIRES, AMBASSADOR, EMBASSY, and CONSUL.

ENYED. See NAGY-ENYED.

ENZIO, or ENTIUS, 1225–72; king of Sardinia, a natural son of Frederick II. and the beautiful Bianca Lancia; b. at Palermo. He fought by his father's side against the Lombards at the battle of Cortenuova before he was 13 years of age, and the following year was married to Adelasia, the heiress of Sardinia and Corsica, and given the title of king of Sardinia. In May, 1239, he was declared vicar imperial in northern Italy, and commanded the German and Saracen troops in the imperial army; he entered the March of Ancona, and became so formidable a foe to the papacy, that the distinguished soldier-cardinal, John of Colonna, was sent against him. Gregory IX. excommunicated Frederick and his son before the end of the year; and a crusade against them was preached soon afterwards. In 1241, the command of the fleet having been intrusted to Enzio, he gained a splendid victory over the Genoese, sinking three of their vessels and capturing 19. Amongst the captives were three cardinal-legates, and many bishops and archbishops; the booty included the large sums of money which the notorious cardinal Otho had just collected in England. After the death of the pope (August), Enzio was sent with a large army to aid his brother Conrad, king of the Romans, against the invading Tartar hosts; the victory won by the two brothers near the river Delphos finally delivered Europe from the presence of these desolating hordes. Enzio was afterwards sent into Lombardy, which was for several years the scene of his chief exploits. In 1245, he was again excommunicated by pope Innocent IV., and in 1247 he besieged Parma, but was forced to retire. He then besieged Colonna, and in 1249 took the castle of Arola, but, on May 26 of the same year, he was taken prisoner at Fossalta by the troops of Bologna and consigned to perpetual imprisonment. "A captive at the age of 24," says Dean Milman, "this youth, of beauty equal to his bravery—the poet, the musician, as well as the most brilliant soldier and consummate captain—pined out 23 years of life, if not in a squalid dungeon, in miserable inactivity." [From *Encyclopædia Britannica*, 9th ed.]

E'OCENE (*eos*, dawn, and *kainos*, recent), a term introduced by Lyell to characterize the lower tertiary strata, from the idea that the fossil shells of that period contain an extremely small proportion (3½ per cent.) of living species. He accordingly looks upon these beds as indicating the dawn of the existing state of the testaceous fauna—no recent species having been detected in the older rocks. The gradual approximation of the living inhabitants of the globe to the present forms is the chief characteristic of the E. and newer deposits. The E. beds rest on the chalk. Like the other tertiary strata, these deposits occupy small and detached areas when compared with the older measures. It is not difficult to determine the relative position of primary or secondary strata, because of the great extent of particular beds, being frequently continuous over extensive districts. But tertiary deposits are more isolated, and occur in smaller and more detached patches; hence it is difficult to determine the contemporaneity of the sections of the various periods, occurring as they do in different isolated localities. Their relations must be determined from the petralogical structure of the beds, which, however, is very inconstant, or from the more satisfactory evidence derived from their fossiliferous contents.

In the following table are given the generally received divisions of this period, with the maximum thickness (in English ft.) of the English strata, and the French and Belgian equivalent beds:

Upper Eocene	1. Hampstead series	175	Calcaire lacustre supérieur, and Grès de Fontainebleau.—Rupelien.
	2. Bembridge series	115	Gypseous series of Montmartre, Calcaire lacustre moyenne, and Calcaire siliceux.—Tongrien.
Middle Eocene	3. Osborne series	70	Grès des Beauchamp.
	4. Headon series	182	
	5. Bagshot series	1270	Sables moyennes, Calcaire grossier, and Lits coquillières.—Laeckenien and Bruxellien.
	6. London clay series	480	Wanting in France.—Ypresien.
	7. Plastic clay series	160	Argile plastique et lignite.—Landenien supérieur.
	8. Thanet sands series	90	Wanting in France.—Landenien inférieur.
	Total thickness	2542 feet.	

EO'LIAN HARP. See ÆOLIAN HARP.

EON, or EUDO DE STELLA, a religious fanatic of Bretagne in the 12th c., who claimed to be the final judge of mankind. He opposed the hierarchy of the church, and taught that the only true baptism was the baptism of the Holy Ghost given by the laying on of hands. He was believed to have miraculous power, and gained many followers. He was opposed publicly by the cardinal-legate Albericus, and in a book by archbishop Hugo of Rouen. Some of his disciples were burned to death for their heresy. In 1148 he was captured, with some of his leading adherents, and tried before the synod at Rheims, but escaped execution because thought insane. After his death his sect soon died out.

EON DE BEAUMONT, CHARLES GENEVIÈVE LOUIS AUGUSTE ANDRÉ TIMOTHÉE D', known as the *Chevalier d'Eon,* was b. at Tonnerre, in Burgundy, in 1728, studied law, and became an advocate. He attracted the notice of the prince of Conti by some political writings; and in 1755 was introduced by the latter to Louis XV., who employed him in diplomatic missions to Russia and Austria. After serving a short time in the army, not without distinction, he was sent to London in 1761 as secretary of embassy, and shortly after was made minister-plenipotentiary. Becoming the victim of a court cabal, however, which deprived him of his office, he took his revenge by publishing his secret correspondence with the French court, which contained, among other things, libels on various persons. For one of these, he was prosecuted in London; and to avoid judgment, fled to the continent. He, however, returned to England again; but, on the death of Louis XV., the French ministry deemed it prudent to recall him, as they were afraid he might betray their secrets to the English government, which made him brilliant offers. The pretext laid hold of for this purpose, was the scandal excited in London by his having assumed the garb of a woman, which he had done at the request of Louis, the better, it may be presumed, to hide his designs as a "secret agent." On his return to France, however, Eon was very favorably received; and Louis XVI. even ordered him to make use of the feminine garb in future. In 1783, he again proceeded to London, not, however, in any visible official capacity; and, though dressed as a woman, gave lessons in fencing, of which art he was a complete master. On the outbreak of the French revolution, he hastened home, and offered his services to the nation; but as nothing came of his offer, he finally returned to London, where he sank into the greatest misery, and d. 21st May, 1810. An examination of Eon's remains by Mr. J. Copeland, a surgeon, settled the question of his sex, and put an end to the curiosity of the English public. His writings appeared at Amsterdam 1775, under the title of *Loisirs du Chevalier d'Eon.* The *Mémoires* which bear his name are not genuine.

EOO'A, or MIDDLEBURG, one of the Friendly or Tonga islands, is 30 m. in circuit, and contains 300 inhabitants. It is in lat. 18° 19' s., and long. 175° 37' west. The surface, which is rocky and barren, rises 600 ft. above the sea. The group, as a whole, was discovered by Tasman in 1643.

EOS. See AURORA, *ante.*

EÖTVÖS, JOZSEF, a highly distinguished Hungarian author, was b. 3d Sept., 1813, at Buda; educated at home by a tutor of republican sentiments, and studied philosophy and jurisprudence at the university of Pesth during the years 1825–31. He became an advocate in 1833, but soon resolved to devote himself exclusively to literature, in which field he had already won a great reputation by his comedies *Kritikusok* (The Critics) and *Házasulók* (The Weddings), and also by his tragedy *Boszú* (Revenge). After his return from a journey through Germany, France, England, Switzerland, and the Netherlands, he published his *Prison Reform* (*Gefängnissreform,* Pesth, 1838), which was instrumental in bringing about many wholesome improvements in regard to prisons. This was followed (1838–41) by his novel entitled *The Carthusian,* which excited great interest, and was pronounced to be one of the best productions of Hungarian literature. E. now began to distinguish himself in politics. When the liberal party split, in 1844, into municipalists and centralists, he became one of the most eloquent advocates of the policy of the latter party, and wrote numerous articles in favor of it in the *Pesti Hirlap,* which are marked by varied learning, fullness of thought, and elegance of expression. They were issued in a collected form at Leipsic in 1846, under the title of *Reform. The Village Notary* (A' Falu' Jegyzöje, 3 vols., Pesth, 1844–46; English by Otto Weneckstern, 1850; German by Mailath) is a work of the highest order of merit. For variety of incident, easy vigor of style, humor, liveliness, and freshness of descriptive power, it has been pronounced equal to the best of the *Waverley Novels.* It was followed in 1847–48 by his *Magyarország* 1514*—ben* (Hungary in 1514), which describes the insurrection of the peasants that happened in that year in a masterly style. When the revolution of 1848 broke out, E. was appointed minister of public instruction, but soon became aware of his own incapacity for the work of a practical statesman, and abandoning his country, which he deemed it impossible for him to serve, retired for some time to Munich, where he employed himself exclusively in literary pursuits. The most important fruit of his residence here was *Der Einfluss der Ideen des* 19 *Jahrh. auf Staat und Gesellschaft.* In 1851, E. returned to Hungary. In 1859, he published anonymously his *Garantien der Macht und Einheit Œsterreichs.* In 1867, he was appointed minister of worship and education, and in that capacity engaged actively in the work of reform. He d. at Pesth on the 3d of Feb., 1871.

EOZOIC PERIOD. See ARCHÆAN PERIOD.

EOZO'ON, supposed by some paleontologists to be one of the oldest geological representatives of animal life, and by others held not to be an animal. It was a huge mass of lower organization than the sponges or protozoa, and belonged (if to animals) to the *foraminifera*. It was jelly-like, without definite organs, but probably with power to secrete a calcareous shell. Remains have been found in Canadian rocks, whence the name *Eozöon Canadense*, and in the oldest European rocks.

EPACRIDA'CEÆ, a natural order of exogenous plants, consisting of shrubs and small trees, which, both in appearance and in botanical characters, much resemble the *ericeæ*, or heath family. The most important distinguishing structural character is indeed found in the simplicity of the anthers, which are one-celled, open longitudinally, and are destitute of appendages. The flowers of the E. have generally a tubular corolla, dividing into five—rarely four—segments; which, however, sometimes become separate petals. The calyx is persistent, often colored, has the same number of segments with the corolla, and is surrounded with small bracts. The stamens are fewer than in the *ericeæ*, usually equal in number to the segments of the corolla, and alternate with them. The fruit is sometimes a capsule, sometimes a berry, sometimes a drupe. The leaves are simple, generally alternate, often crowded; the flowers in spikes, in terminal racemes, or axillary and solitary.—About 400 species of E. are known, all natives of the Indian archipelago, the South Sea islands, and Australia; in which regions they seem to occupy the place of the heaths of other parts of the world. Some, particularly of the genus *epacri*, are well-known ornaments of our green-houses, and are flowering shrubs of great beauty. Some produce edible berries resembling the cranberry. See CRANBERRY.

E'PACT, in chronology, is the excess of the solar month above the lunar synodical month; or of the solar year above the lunar year of twelve synodical months; or of several solar months above as many synodical months; or of several solar years above as many periods, each consisting of 12 synodical months. The menstrual E. is the excess of the civil calendar month above the lunar month. For a month of 31 days, this E. is 1 day 11 hours 15 minutes 57 seconds, if we suppose new moon to occur on the first day of the month. The annual E. is the excess of the solar year above the lunar. As the Julian solar year is (nearly) 365 days, and the Julian lunar year is (nearly) 354 days, the annual E. is nearly 11 days. The E. for two Julian years is, therefore, nearly 22 days; for three years, 33 days; and so on. When, however, the epact passes 30 days, 30 falls to be deducted from it, as making an intercalary month. For three years, then, the E. is properly 3; and for 4 years, adding 11 days, it is 14 days; and so on. Following the cycle, starting from a new moon on the 1st of Jan., we find that the E. becomes 30 or 0 in the 19th year. The E. for the 20th year is again 11; and so on. The years in the cycle are marked by Roman numerals, I. II. III., etc., called the golden numbers; and a table of the Julian epacts exhibits each year in the cycle with its golden number and epact. As the Gregorian year (see CALENDAR) differs from, and is in advance of, the Julian by 11 days (the number lost on the Julian account before the Gregorian computation of time was introduced in England), and as 11 days is the difference between the solar and lunar years, it follows that the Gregorian E. for any year is the same with the Julian E. for the year preceding it.

EPAMINON'DAS, the most eminent of Theban generals and statesmen, and one who for a long period elevated his country to the highest point of honor and prosperity, was b. 414 B. C. He was descended from an ancient but impoverished family, and led a retired life till his 40th year, profiting by the instructions of Lysis the Pythagorean, who inspired him with enthusiasm for the elevated ideas which it was the object of his life to realize. E. first becomes prominent during the period when the Lacedemonians garrisoned the citadel of Thebes, and kept the inhabitants in subjection. Though he took no part in the desperate but successful stratagem by which his fellow-citizens recovered the *Cadmeia* in 379 B.C., he stepped forward immediately after into the ranks of the patriots; and when sent to Sparta in 371 B.C., along with several others, in order to negotiate a peace between the two countries, E. displayed as much firmness and dignity as eloquence in the debate which ensued upon the question whether Thebes should ratify the treaty in the name of all Bœotia, the result of which ratification would have been equivalent to a recognition of her claim to supremacy over the Bœotian towns. To this the Lacedemonians demurred, and the war was again resumed; E. was appointed commander-in-chief; and, in conjunction with his friend Pelopidas, with an army of 6,000 men, defeated double that number of the enemy at Leuctra (371 B.C.). Two years later, he and Pelopidas marched into the Peloponnesus, incited several of the allied tribes to fall away from Sparta, and then turned his arms against that city, which, however, was bravely defended by Agesilaus. On his return to Thebes, E. was accused of having violated the laws of his country, by retaining the supreme power in his hands beyond the time appointed by law; but was acquitted in consequence of his open and animated defense. In the spring of 368 B.C., the war was renewed with increased fury between Thebes and Sparta, and E. once more marched into the Peloponnesus, but did not accomplish much; and on his return home, received a check from Chabrias at Corinth. To atone for this unsuccessful undertaking, he advanced with 33,000 men into Arcadia,

and joined battle with the main body of the enemy near Mantineia, in the year 362 B.C. E., at the head of his troops, succeeded in breaking the Spartan phalanx, but was mortally wounded in the breast by a javelin. Being told by the physicians that he would die as soon as the weapon was extracted, on receiving intelligence that the Bœotians had gained the victory, he is said to have torn out the javelin with his own hand, exclaiming: "I have lived long enough." His moral purity, justice, and clemency are extolled by the ancients as much as his military talents; and it is expressly recorded of him, that he never told a lie, even in jest. Compare Bauch *Epaminondas und Thebens Kampf um die Hegemonie* (Breslau, 1834); Pomtow, *Das Leben des E.* (1870).

EPANOME'RIA, a t. in Santorini, one of the Grecian islands, built on a steep promontory, so that the houses are ranged in terraces one row above another to the number of 15 or 20. Some are excavations in the rock, and the lowest are 400 ft. above the sea. The place is reached by a winding pathway cut in the face of the cliff, on the summit of which are many windmills.

EP'ARCH, the governor of a province in ancient Greece, or prefect of a region under the rule of Rome. In modern Greece a province of the kingdom is called a nomarchy, and a subdivision of a nomarchy an eparchy. In Russia the term has an ecclesiastical use, denoting the diocese or archdiocese of a bishop or archbishop.

EPAULE'MENT (from the French *épaule*, shoulder), in siege-works, is a portion of a battery or earthwork. The siege-batteries are generally shielded, at one end at least, by epaulements, forming an obtuse angle with the main line of the battery. The object is to protect the guns and gunners from a flanking fire. The name is often given erroneously to the parapet of the battery itself, but it applies properly to the flanking return only. Sometimes the whole of a small or secondary earth-work, including the battery and its flanks, is called an E.; and sometimes the same name is given to an isolated breast-work intended to shield the cavalry employed in defending a body of besiegers.

An *épaule* is the shoulder of a bastion, where one of the faces and one of the flanks meet; and this points to the proper meaning of E., as a shoulder or flanking work.

EP'AULET, from the same French source as epaulement, is a shoulder-knot worn by commissioned officers in the naval profession, both as an ornament and a distinction. In the British navy, the officers of and above the rank of lieutenant wear epaulets of gold lace, one on each shoulder, sub-lieutenants wearing one only. Ranks and degrees are marked in a very systematic way by means of crowns, anchors, and stars worked in silver on the E., and also by the size of the cords of the E. itself. This decoration was formerly universal in the British army, officers wearing those of gold, men of worsted; but they were abolished during the Russian war, in consequence of the danger to which officers thus easily marked out were exposed. It is retained by the French army alone of the armies of the great powers. Militia officers wore epaulets of silver cords.

EPÉE, CHARLES MICHEL, ABBÉ DE L', one of the founders of the system of instruction for the deaf and dumb, was b. at Versailles, 25th Nov., 1712. He studied for the church, and entering into holy orders, became a preacher and canon at Troyes, but eventually, on account of his Jansenist opinions, was deprived of this appointment. He now lived in retirement in Paris. In the year 1755, he first began to occupy himself with the education of two deaf and dumb sisters; and, as he asserts, without any previous knowledge of Pereira's efforts in the cause, invented a language of signs, by which persons thus afflicted might be enabled to hold intercourse with their fellow-creatures. His first attempt being crowned with success, he determined to devote his life to the subject. At his own expense, he founded an institution for the deaf and dumb, and labored with unwearied zeal for its prosperity. His favorite wish, however, the foundation of such an institution at the public cost, was not fulfilled till after his death, which took place 23d Dec., 1789. He wrote a work, entitled *Institution des Sourds et Muets* (2 vols., Paris, 1774), which afterwards appeared in an improved form under the title, *La Véritable Manière d'Instruire les Sourds et Muets* (Paris, 1784).

EPEI'RA, a genus of spiders, the type of a family called *epeiridæ*. They are of those spiders which have only a pair of pulmonary sacs and spiracles; construct webs with regular meshes, formed by concentric circles and straight radii; and are furnished with a pair of almost contiguous eyes on each side, other four eyes forming a quadrangle in the center. Many of them are remarkable for the beauty of their colors and of their forms. Several species abound in our gardens, particularly in autumn. *E. diadema* is one of the largest British spiders. It is found in moors, the borders of woods, etc.; but it is in tropical countries that the *epeiridæ* exist in greatest numbers, and attain the greatest size and beauty, extending from branch to branch their lace-work, remarkable for gracefulness of design. The net, when loaded with wings, wing-covers, and limbs of insects that have been preyed upon, is often loosened, and falls down upon the central nest or den of the spider; and successive nets thus falling down, form at last a ball sometimes as large as a man's head. Some of the spider cords, carried horizontally from tree to tree at a considerable height from the ground, "are so strong as to cause a painful check across the face when moving quickly against them: and more than once," sir J. E. Tennent says, "in riding I have had my hat lifted off my head by a single thread."—Tennent's *Ceylon*.

EPERÏES (Lat. *Fragopolis* or *Eperesinum;* Hung. *Eperjes, Slovak Pressova*), an old t. of Hungary, in the co. of Saros, of which it is the capital, is agreeably situated on the left bank of the Tarcza, about 150 m. n.e. of Pesth. It is surrounded with walls, is the seat of a bishop, and contains some houses of the 15th and 16th centuries, built in the style of those in Naples, with which E. was much connected in the middle ages. Its principal buildings are the church of St. Nicholas, the communal college, with 500 students and a library consisting of 14,000 volumes, and the county hall. It has manufactures of earthenware and of linens and woolens, and has some trade in linen goods, corn, and Tokay wine. In the vicinity are the Sovar saltworks, which produce 5,000 tons of salt annually. Pop. in '69, 10,772, almost wholly Slavonic.

EPERNAY, a t. of France, in the department of Marne, is the headquarters of the *vins de Champagne,* and is situated in the midst of a rich vine-growing district, on the left bank of the Marne, 19 m. w.n.w. of Chalons. It is well built, clean, and well paved. Its environs consist, for the most part, of elegant villas, with vaults attached, belonging to the Champagne wine-merchants. E. manufactures large quantities of earthenware from a clay obtained in the neighborhood, and called *terre de Champagne;* also hosiery, refined sugar, and leather. It has a brisk trade in bottles, corks, wire, Champagne wines, etc. Pop. '76, 15,414.

E'PHAH, a measure of capacity for dry goods in use among the Hebrews. It contained three English pecks and three pints.

EPHEM'ERA (Gr. lasting for a day), a Linnæan genus of neuropterous insects, now forming the family or tribe *ephemeridæ.* They are allied to the *libellulidæ,* or dragon-flies, but differ from them in many very important respects. They have received their name, to which corresponds the English DAY-FLY, sometimes also applied to them, from the brief duration of their existence in the perfect state, in which, very unlike the dragon-flies, they are believed to take no food, merely propagating their species, and dying. From the season of the year in which they begin to be seen, some of them are also called MAY-FLY; and by this name are well known to anglers, who use them, and artificially imitate them as excellent lures for trout. The eggs of the ephemeræ are also a favorite food of fishes; they cohere together in a gelatinous mass. The larvæ and pupæ are aquatic, and in these states the ephemeræ have a much longer life than in their perfect state, extending even to years. The larvæ and pupæ are sufficiently voracious. The abdomen of the larva is furnished on each side with a set of leaflets, which serve instead of gills for respiration, and are also used in locomotion, although there are 6 ft. attached to the thoracic segments. The pupæ differ little from the larvæ except in having rudimentary wings inclosed under scales. Both larvæ and pupæ have the abdomen terminated by two or three jointed filaments, which the perfect insect also has, sometimes very long. The body of the perfect insect is soft and slender; the wings resemble in form those of dragon-flies, but are soft and filmy; in repose, they are elevated vertically above the body; the second pair of wings are much smaller than the first, and in some species are altogether wanting; the organs of the mouth are so soft and small as not easily to be discerned, and to be apparently unfit for any kind of use. Ephemeræ, in their larva and pupa states, live chiefly under stones in water, or in burrows which they make in the banks of streams. When ready for their final change, they creep out of the water to undergo it on some plant or other object by the water-side, generally towards sunset on some fine day of summer or autumn. After having attained their winged state, however, they cast off a complete slough or envelope, so perfect, that it exhibits even the limbs, abdominal filaments, and antennæ; and these "ghost-like exuviæ" are sometimes so abundant in the neighborhood of streams, as to cover in "a pearly layer" the hat and basket of the angler. The multitudes of ephemeræ are often very great, filling the air as a cloud; nay, so abundant are they at times, that their bodies have been known to cover the ground in certain districts of France, and have been gathered from particular spots in cart-loads to be used as manure.

EPHEM'ERA, or FEBRIS DIARIA in Latin (from Gr. *epi* and *hemera,* on a day), a fever which lasts only a single day, or part of a day, and is generally dependent on some slight local irritation. It hardly requires any other treatment than the removal of the cause, if known.

EPHEM'ERIS (Gr. "for the day") is a name applied to almanacs from their containing notices for each day. It is mostly confined to astronomical tables giving the daily places of the sun, moon, and planets, and other phenomena of the heavens. Such tables have become common since the days of Kepler. The first were published by Purbach for the years 1450–61. Those of Regiomontanus, for 1474, were much more accurate, and his ephemerides met with universal acceptance. Similar publications were afterwards made by Leovitius, Origanus, Kepler, and others. The most important works of the kind at present are the French *Connaissance des Temps,* the English *Nautical Almanac,* the Berlin *Astronomisches Jahrbuch,* and the *American Ephemeris and Nautical Almanac.*

EPHE'SIANS, EPISTLE TO THE, is a letter addressed by St. Paul, during his first imprisonment at Rome, to the church which assembled in Ephesus (q.v.). This church had been planted by the apostle himself, and, as we infer from various circumstances

mentioned in the Acts of the Apostles, was an object of his special affection. The epistle was written almost at the same time as that to the Colossians, and consequently breathes the same spirit of exalted piety and fervid faith, besides containing many similar thoughts and exhortations. It may be divided into two grand parts, the first of which is for the most part *doctrinal*, and the second practical. The proofs of its *genuineness* and *authenticity* have generally been considered unquestionable; but some years ago De Wette, in his *Introduction to a Commentary on the Ephesians* (2d edit. 1847), tried to show that this epistle is simply an expansion of the grander epistle to the Colossians, though he admits that it has the appearance of having been compiled in the apostolic age.

EPHESIANS, EPISTLE TO THE (see *ante*), is universally admitted to have been written by the apostle Paul. It is expressly ascribed to him by Ignatius (if indeed any writings attributed to *him* are genuine), who was contemporary with Paul; is alluded to by Polycarp, a friend of the apostle John, and cited by Irenæus, Clement of Alexandria, Tertullian, Origen, and many subsequent writers. Some critics have maintained that it was not addressed to the Ephesians, but either to the Laodiceans or to several churches in common, of which Ephesus may have been one. The reasons which they assign for this opinion are: 1. That Marcion, a heretical writer of the 2d c., asserts that in his copy of the epistle the reading was "in Laodicea," and not "in Ephesus." The answer to this is that as Marcion is known to have altered the text in other instances to suit his own views, he is not to be trusted, especially when all known ancient manuscripts and all ancient versions read "in Ephesus." 2. That as Paul directed the Colossians to read the epistle *from* Laodicea, he must have written an epistle *to* Laodicea, which is either this so-called epistle to Ephesus or else has been lost. To this the answers are: (1) If he did write to Laodicea, it may have been a letter designed for local and temporary use only. As Christ said and did many things which he did not design to have recorded in the small book of the New Testament, why may not an apostle have written some things which were not to have a place there? (2) Paul charged the Colossians to let the epistle which he sent them be read by the Laodiceans; but why would he have wished this so earnestly if at the same time he had written to Laodicea this "epistle to the Ephesians" (which so greatly resembles that to the Colossians), and had intrusted both to the same messenger to be delivered at about the same time? (3.) It is said that if the epistle had been written to the Ephesians, among whom Paul had spent three years of most loving and successful ministry, it could not have been so general in its style, and would have contained personal salutations at the close. To this the answers are: (1) This epistle and that to the Colossians, written at the same time, both show that Paul's thoughts were intent on Colosse, Laodicea, Hierapolis, those whom he had never seen, the Gentiles at large, and God's eternal purpose with reference to them all. In all that he then wrote, therefore, themes of general and permanent interest might naturally prevail to the exclusion of personal and transient things. (2) At the close of the epistle he expressly says that he has committed all matters of a personal nature between himself and his readers to the beloved and faithful brother who was the bearer of the epistle, and whom he sent to them for the very purpose of making them acquainted with his condition and of comforting their hearts. Such provision having been made for loving salutations and all other particulars which his former relations to the Ephesians would prompt, the entire absence of them from the epistle itself is explained.

The doctrinal part of the epistle contains thanksgiving to God for the revelation of his eternal purpose of grace to men; prayer that Christians may receive the full measure of the blessings provided for them; the native character of mankind as dead in sins; regeneration by the grace of God, and the benefits, present and future, resulting from it; salvation by divine grace and not by human works; good works the fruit of regeneration; privileges resulting from the reception of salvation by grace; statement of God's purpose to receive the Gentiles among his people; repeated prayer that Christians may receive the fullness of the blessings provided for them; renewed ascriptions of perpetual glory to God in the salvation of men. The practical part consists of exhortations to Christian unity, progress in the new life, general holiness of conduct and heart, the particular virtues of truthfulness, self-control, honesty, purity in words and deeds, sobriety, cheerfulness, fidelity in the relations of wives and husbands, children and parents, servants and masters, and strenuous maintenance of the spiritual warfare, by strength to be obtained from God and under the protection of the armor which he provides.

EPH'ESUS, one of the twelve Ionic cities of Asia Minor, was situated in Lydia, near the mouth of the river Caystrus, in the midst of an alluvial plain. It does not appear to have been as old as the Trojan war, but its primitive history has been confused by myths. It bore a great variety of names at different times, the principal of which, besides E., were Ortygia and Ptelea. According to Strabo, it was founded by Androclus, son of Codrus, and this is the most probable of the accounts which have come down to us, though others held to the tradition of its Amazonian origin. It was long before E. acquired any political importance, in spite of being a sacred city from an early period. Subdued first by the Lydian, and next by the Persian kings, it was

included, after the death of Alexander the great, in the territories of Lysimachus (281 B.C.), by whom it was greatly strengthened. Ultimately, it came into the possession of the Romans; and in the time of Augustus, when Strabo wrote, it was "the greatest place of trade of all the cities of Asia w. of the Taurus." This was also its condition when visited by St. Paul, who resided here three years; but the destruction of its great temple by the Goths, in 260 A.D., gave it a blow from which it never recovered. In 341, A.D., it was the scene of the *third* general council of the Christian church. Its general history, while a city of the Byzantine empire, was unimportant, and before the days of Tamerlane it had almost completely perished.—The ruins of E. comprise a stadium 687 ft. long, fragments of a great theater (alluded to in the account of St. Paul's preaching in the city), of an odeum or music-hall, and of various walls and towers, belonging to the Greek, Roman, and Byzantine eras. Near the western extremity of the town are also some massive structures, which have since 1868 been carefully excavated, sometimes from beneath 18 ft. of soil. It is now certain that these stand on the site of the famous *temple of Diana*. This marvelous building, one of the seven wonders of the world, was originally built by Chersiphron; but after its destruction by Herostratus on the night (as is said) when Alexander the great was born (356 B.C.), it was rebuilt by the inhabitants in a style of greater splendor than before, the very women contributing their ornaments to secure the necessary funds; yet, notwithstanding this enthusiasm, more than 200 years elapsed before the new edifice was completely finished. It was the largest Greek temple ever constructed. Its length was 425 ft., its width 220, the number of its columns 128, of which 36 were carved, and their height 60 feet. It had an area more than four times that of the Parthenon at Athens, and even the Olympeium was only about two thirds as great. But even more wonderful than the temple itself were the numberless statutes and pictures which it contained, executed by the best masters of Greece. The altar of the goddess was principally adorned with the works of Praxiteles. Plundered of its treasures by Nero, and burned (as has been mentioned) by the Goths, it was most likely finally destroyed by the iconoclasts, in the reign of Theodosius I., who issued his celebrated edict against the ceremonies of the pagan religion 381 A.D. The site of E. is now occupied by some wretched villages, the principal of which is Ayasaluk.—Certain cabalistic words or sayings are said to have been inscribed on the figure of Diana, which being copied and carried about as charms, became known as *Ephesæ litoræ* (Mason's *Anatomie of Sorcerie*, 1612).

EPHOD, a vestment worn by the Jewish high-priest over the *mĕïl* or second (purple) tunic. It consisted of two shoulder-pieces, one covering the back, the other the breast and upper part of the body, not unlike the Greek *epōnis*. Two onyx stones set in gold fastened it on the shoulders, and on each of the stones were engraved the names of six tribes, according to their order. The material of which the E. was wrought was extremely costly and magnificent: "gold, blue, purple, crimson, and fine twined linen." A girdle or band, of one piece with the E., fastened it round the body. Just above this girdle, in the middle of the E., and joined to it by little gold chains, rings, and strings, rested the square oracular breast-plate with the mysterious *Urim and Thummim*. See also HIGH-PRIEST and URIM AND THUMMIM.

Originally intended to be worn by the high-priest exclusively, ephods of an inferior material seem to have been in common use in later times by the ordinary priests. Even David, when bringing the ark back to Jerusalem, appeared in one. There is also mention made of an E. in several passages of the books of Judges and Samuel, where the word must needs stand either for the *whole* priestly apparatus of an illegal service, or simply for a statue or an idol. The Talmud understands this E. to have been a colossal shoulder vestment of gold, to which divine honors were rendered.

EPHORI (Gr. "overseers"), an order of magistrates in ancient times which appears to have originated at Sparta, and to have been peculiar to the Doric governments. When or by whom the E. were first instituted, is a point of great uncertainty. Herodotus attributes their creation to Lycurgus, and Aristotle to Theopompus (770–720 B.C.). Their duty was to superintend the internal administration of the state, especially affairs of justice, for which a particular building was assigned them, called the Ephorion. One of their most important functions was the oversight, at least in part, of the education of youth, for we are told by Athenæus that they inspected the clothing and bedding of the young men. The E. were five in number; they were elected by and from the people—on which Aristotle observes, that through them the *demos* enjoyed a participation in the highest magistracy of the state—and held their office only for one year. Their influence gradually increased, for their powers were so ill defined that it was difficult to say what was *not* under their cognizance and authority. Cicero draws a comparison between the ephoralty of Sparta and the tribunate of Rome, which is not altogether unwarranted by the facts of the case. Ultimately, the kings themselves became subject to the supervision of the ephori. Cleomenes, for example, was brought before them for bribery; Agesilaus was fined, and Pausanius imprisoned; and in extreme cases they could prefer charges against them, and have them tried before the supreme criminal court. They also transacted the negotiations with foreign powers, subscribed treaties, raised troops, "intrusted the army to the king or some other general," and, in fact, acted as the executive of the state. Muller regards the ephoralty as "the principle

of change in the Spartan constitution, and, in the end, the cause of its dissolution." In the hands of the E., the constitution of Sparta certainly ceased to be a genuine aristocracy, and became a sort of oligarchy; but this point is involved in much obscurity and perplexity. Their authority, however, was at last destroyed by Agis and Cleomenes, who murdered the E. for the time being, and restored the old Spartan constitution (225 B.C.).

E'PHRAEM SY'RUS, one of the most celebrated and prolific ecclesiastical writers of the Syrian church. Several accounts of his life have been handed down to us, but they all bear more or less such a legendary character, that the real facts to be gathered from them are but scanty. It appears, then, that Ephraem (Heb. *Ephraim*) was born in the early part of the reign of Constantine the great, "somewhere between the Euphrates and Tigris," most probably at Nisibis. His parents were, according to some, heathens; and Ephraem, repudiating their idolatry at an early age, had to leave their roof. Jacob, bishop of Nisibis, took care of the boy, and undertook his education. His progress in learning was so satisfactory that the bishop was soon able to make him teacher at his own school; and when in 325 A.D. Jacob went to the council of Nicæa, Ephraem accompanied him thither. In 363, Nisibis was ceded by Jovinian to the Persians, and Ephraem first retired into Roman territory, then went to Anid, his mother's birthplace, and finally settled in Edessa (Orfa), where he remained until his death. He is said to have been so poor when he first arrived at Edessa, that he was obliged to take service at a public bath, but he soon became acquainted with hermits of the neighborhood, and adopted their habits; he retired into a cave near the town, and led the life of a recluse. But so great were his piety and asceticism, as well as his readiness to help the poor and tend the sick, that he was looked upon as a saint, and his day is still celebrated, at different dates, in various churches. Among his usual denominations, more especially referring to his teachings and writings, are "Prophet of the Syrians, Column of the church, Harp of the Holy Spirit," etc.; and his name is never mentioned without the "Mor" or "Mari" (Lord, My Master) being prefixed. But for all that, he had no lack of enemies. His burning zeal for preaching and converting led him to attack most fiercely almost every one beyond the pale of his peculiar creed. He spoke and wrote unceasingly against Idolaters, "Chaldees," Jews, and heretics of all kinds, especially Arians, Sabellians, Manichæans, Novatians, etc. Towards the end of his life, he paid a visit to Basil the great, in Cappadocian Cæsarea, who could not prevail upon him to accept of any higher office in the church than a deanery, though he spared no effort to make him bishop. Returned to Edessa, he found plague and famine raging there, and to his over exertions for the relief of the sufferers his death is attributed by some. He expired in the same year with Basil, in 378, not before having given the strictest injunctions that his burial should be of the very simplest description. With respect to the Testament which he is reported to have dictated in his dying hour—much as it has been used for biographical purposes—we can take no notice whatever of it, as it is entirely spurious.

The visit to Basilius, unimportant as it seems, has been of very great moment The legend which surrounds this, as all other incidents of his life, with a halo of miracle, records that the two men, although previously ignorant of each other's language, began to speak them fluently at this interview—Basilius Syriac, and E. Greek. This wonderful circumstance first induced the learned to enter upon the question, whether E., half of whose voluminous works are in Greek, did really understand that language; and further, whether he understood any language but his own, Syriac. If he did not, what view was to be taken of his commentaries on the Bible, of which the Hebrew and Greek texts, as well as the Septuagint and the Greek fathers, must have been a sealed book to him. There were, and are still, great differences of opinion on these points, but it is generally taken for granted now, that he did not understand any language but his own; that he made use of the common Syriac version, the Peshito; that his grammatical and linguistic notes are taken from different Syriac commentaries, and that the Greek portion of his works consists partly of translations made from his Syriac after his death, or even during his lifetime, and partly of interpolations. Both the praise and the blame which have been indiscriminately bestowed upon him as a writer are exaggerated. His chief merit lies in the glowing fervor and the deep piety which he infused into all he wrote, more particularly into his elegiac hymns. Diction and form are poetical throughout, and when not soaring into the infinite, of no mean beauty. The effect is heightened by the matchless simplicity and awing grandeur of the Syriac idiom.

We will now enumerate his principal works and their editions. Those (under his name) in Greek, consist of sermons or homilies, and treatises of an exegetic, dogmatic, and ascetic nature. Photius records that he wrote more than a thousand such sermons; Sozomenos speaks of "300 myriads;" but, as we said before, of those that have come down to us, some are spurious, and others at least suspicious. Gerhard Vossius translated 171 treatises from Greek MSS. found in Italian libraries, into Latin, and published them at Rome, 1589–98, in 3 vols. (There is but one piece in them translated from the Syriac.) They were reprinted in Cologne in 1603, 1619 (1675), and also in Antwerp, in 1619. The first Greek edition appeared in Oxford in 1709, edited from 28 Oxford MSS., by E. Thwaites. The most important of his Syriac works are, besides an infinite variety of homilies, sermons, poems, etc., his commentaries, or rather scholia, on parts

of the Old Testament. Their value to us, however, is limited to their aiding us in explaining and fixing some readings of the Peshito (see PESHITO), and in enriching our critical apparatus. That he also commented on the Gospels is certain, but no MS. has been found as yet, not even in a Greek or Arabic translation. As to the songs and prayers in the Syrian liturgy ascribed to E., they are simply composed in his manner, and betray their comparatively recent origin at the first glance. The principal edition of his works in Syriac and Greek was published in 6 vols. in Rome, under the papal authority (1732–1746).

The principal writers on E. are: Sozomenos, *Hist. Eccl.*, iii. 16; Assemani, *Proleg.* and *Biblioth. Orient.*; Credner, *De Proph. Min. Vers. Syr.* (1827); Lengerke, *Comm. de Ephr. Syr. S. S. Interprete* (Halle, 1828); and *De Ephr. Syr. Arte Hermen.*, etc. (1831). Some tasteful German translations of hymns, by Zingerle, are to be found in the *Zeitschr. d. Deutschen Morgenl. Gesellsch. passim.*

EPHRAIM, the younger son of Joseph by his wife Asenath, and the founder of one of the twelve tribes of Israel. It is possible that he may have received his name, which signifies "double fruitfulness," from having been born during the seven years of plenty. His grandfather, Jacob, shortly before his death, prophesied the greatness of his posterity when giving him his blessing: "His seed shall become a multitude of nations" (Gen. xlviii. 19). After the Israelites had left Egypt, the tribe of Ephraim numbered 40,500 (Numbers i. 32, 33); but from causes not specified, and not discoverable, it had sunk, 40 years later, on the eve of the conquest of Canaan, to 32,500 (Numbers xxvi. 37). Yet it was under the leadership of an Ephraimite, Joshua, the son of Nun, that the Canaanites were subjugated, and the land possessed. This seems to have given the tribe a much higher influence than might have been expected from its numerical strength. We find Judah and Ephraim classed together as taking their inheritance first (Josh. xv. xvi., etc.). The precise boundaries of Ephraim, as of the other tribes, it is impossible to determine. It occupied the center of Palestine, was bounded on the s. by Dan and Benjamin, and stretched from the Jordan on the e. to the Mediterranean on the west. From scattered notices of the Ephraimites in the earlier annals of the Hebrews, we infer that they were, on the whole, jealous of their brethren. This feeling of dissatisfaction at length broke out into rebellion in the reign of Rehoboam, and the new kingdom of Israel, ruled over by Jeroboam, was for the most part merely the kingdom of Ephraim, for the land which lay to the n. of it could hardly be said to be actually in the possession of the tribes whose names it bore, the original inhabitants keeping stubborn hold of their cities and strongholds. See the article JEWS.

EPI, or GIROUETTE (Fr.), a species of ornamental ironwork with which the cones of pavilions or pointed roofs are sometimes surmounted in the renaissance style of architecture. One of the finest examples is that which surmounts the Tourelle aux Pastorals at the hôtel de Bourgtheroulde in Rouen.

EPICHARMUS, a famous Greek poet, was b. in the island of Cos, in the 5th c. B.C. At first, he studied philosophy under Pythagoras; but a residence at Megara, the native soil of comedy, gave him a taste for that branch of the drama. After the destruction of Megara, in 484 B.C., he removed to Syracuse, where, at the court of Hiero, he spent the remainder of his life. From this circumstance, he is often mentioned by the ancients as a Sicilian. Almost nothing else is known of his personal history except that he died at the age of 90, or as some say, of 97. The date of his death, as of his birth, is unknown. E. is called by Theocritus the father of comedy, and Plato assigns to him a place among comic writers as high as that of Homer among epic poets. He certainly did a good service in excluding, to a large extent, from his dramas the vulgar buffoonery which disgraced all previous comedies, and in introducing a regular plot in which the *comus* or band of revelers sustained the dialogue. None of E.'s works survive entire; but we possess several fragments and the titles of thirty-five. They embraced a wide variety of topics, mythological, social, and political. From one of them, Plautus borrowed the plot of his *Menæchmi*, which shows a great amount of constructive skill. The fragments of E. have been collected and edited by H. P. Krusemann (Haarlem, 1834). Compare Lorenz, *Leben u. Schriften des E.* (1864), and Guigniant, *Histoire del a Comédie Antique* (1863).

EPIC POETRY (Gr. *epos*, a word, a discourse, or narrative). The two chief kinds of poetry are E. P. and lyric poetry. E. P. has outward objects for its subject, of which it gives an imaginative narrative. The events themselves may be partly real and partly fictitious, or they may be altogether fictitious. Lyric poetry, on the other hand, sets forth the inward occurrences of the writer or speaker's own mind—his feelings and reflections. No composition, perhaps, answers, in all its parts, to the one of these descriptions, or to the other; but a piece or poem is classed as epic or lyric according to the element that predominates. Under each of these grand divisions, or genera, there are subdivisions, or species. The longer poems of the epic genus embrace an extensive series of events, and the actions of numerous personages. The term *heroic* epic, or *heroic* poem, is properly applied to such works as the *Iliad* and *Odyssey* of Homer, Virgil's *Æneid*, Tasso's *Jerusalem Delivered*, Ariosto's *Orlando Furioso*, and others, which describe the achievements of the gods and heroes of antiquity, or of the little less mythic knights of mediæval chivalry. Poems, again, like Milton's *Paradise Lost* and Dante's

Divina Commedia, are *sacred* epics. Byron's *Childe Harold*, with the length and narrative structure of an epic, abounds in reflection, sentiment, and satire, and thus is, in substance, as much lyric as epic. Productions like those now named, formed the class of grand epics, or epic poems, by way of eminence. But there are several species of minor poems which, from their nature, must also be ranked as epics. One of these is the *Idyl*, a term applied to what is called *pastoral poetry*, or to descriptions in general of natural scenery, and of the actions and manners of men in calm, ordinary life. Burns' *Cotter's Saturday Night*, Goldsmith's *Deserted Village*, and most of Crabbe's poems, are idyls; so are poetical epistles. The *ballad* (q.v.) is another species of minor epic.

Attempts at epic poetry are now rare, the spirit of the age being against that form of composition. Instead of epic poems, we have *novels*, which, so far as subject is concerned, may be considered as the epics of modern civil and domestic life.

EPICTE'TUS, a celebrated disciple of the Stoa, was born at Hierapolis, in Phrygia, about fifty years after the birth of Christ. He was at first the slave of Epaphroditus, a freedman of Nero, at Rome, whose abusive treatment he is said to have endured with the composure characteristic of the set to which he belonged. He was afterwards manumitted, and devoted himself to the Stoic philosophy. Domitian hated him on account of his principles, and banished him, along with several other philosophers, from Rome. E. settled at Nikopolis, in Epirus. Under the pressure of the times in which he lived, his serious moral views received a character rather of self-denial than of energy; to renounce, to endure, and not to set the mind upon anything beyond the power of the individual to attain, being the points chiefly insisted on. His pupil, Arrianus, collected the maxims of E. in the work entitled *Encheiridion* ("handbook") and in eight books of commentaries, four of which are lost. The peculiar excellence of the writings of E. consists in their simple and noble earnestness. The real heartfelt love of good and hatred of evil which we are in the habit of supposing an exclusively Christian feeling, does manifest itself very finely and beautifully in these, yet, as prof. Brandis says, "there is not a trace in the *Epictetea* to show that he was acquainted with Christianity, and still less that he had adopted Christianity, either in part or entirely." Some of his opinions, moreover, are essentially Christian in their nature, though, of course, they are unconnected with the facts of revelation. E. believes in our "resemblance" to God, in our "relationship" to him, and in our "union" with him through the coincidence of the "will" and the "soul;" he recognizes the contest between good and evil, the life-struggle in the heart, the divine life against which the law in the members wars; and he affirms the necessity of "invoking God's assistance in the strife," that the inner life may become pure as God is pure. There are several good editions of the works of E., the most complete of which is that of Schweighaüser (Leip. 1800).

EPICU'RUS, AND EPICURE'ANISM. Epicurus, an illustrious Greek philosopher, was b. in the island of Samos, 341 B.C., seven years after the death of Plato. His father, Neocles, is said to have been a schoolmaster, and his mother, Chœrestrate, to have practiced arts of magic. At the age of 18, he repaired to Athens, where it has been supposed that he may have had for his teacher Xenocrates or Theophrastus, or perhaps both, but he himself used to declare that he was self-taught. Of the older philosophers, he was most attached to Anaxagoras and Democritus, his system of physics being evidently built upon the atomic speculations of the latter. E.'s stay at Athens on this occasion was short. At Mitylene, in his thirty-second year, he first opened a school; and there and at Lampsacus he taught for five years. In 306 B.C., he returned to Athens, and established a school of philosophy in a garden which he purchased and laid out for the purpose. From this circumstance, his followers were called the "philosophers of the garden." Although E. laid down the doctrine, that *pleasure* is the chief good, the life that he and his friends led was one of the greatest temperance and simplicity. They were content, we are told, with a small cup of light wine, and all the rest of their drink was water; and an inscription over the gate promised to those who might wish to enter no better fare than barley-cakes and water. The chastity of E. was so incontestable, that Chrysippus, one of his principal opponents, in order to deprive him of all merit on the score of it, ascribed it to his being without passions. The calumnies which the Stoics circulated concerning him are undeserving of notice, and were at no time generally believed. E.'s success as a teacher was signal; great numbers flocked to his school from all parts of Greece, and from Asia Minor, most of whom became warmly attached to their master, as well as to his doctrines, for E. seems to have been characterized not less by amiability and benevolence than by force of intellect. He died 270 B.C., in the seventy-second year of his age.

E. was a most voluminous writer. According to Diogenes Laertius, he left 300 volumes. Among others, he had 37 books on natural philosophy, a treatise on atoms and the vacuum; one on love; one on choice and avoidance; another on the chief good; four essays on lives; one on sight; one on touch; another on images; another on justice and the other virtues, etc. Almost all these works are lost: the only writings of E. that have come down to us are three letters, and a number of detached sentences or sayings, preserved by Diogenes Laertius, in his life of the philosopher. The principal sources of our knowledge of the doctrines of E., besides the above letters, etc., are Cicero, Sen-

eca, and, above all, Lucretius, whose great poem, *De Rerum Natura*, contains substantially the Epicurean philosophy.

Although the majority of E.'s writings referred to *natural* philosophy, yet he was not a *physicist*, properly speaking. He studied nature with a *moral* rather than with a *scientific* design. According to him, the great evil that afflicted men—the incubus on human happiness—was FEAR; fear of the gods and fear of death. To get rid of these two fears, was the ultimate aim of all his speculations on nature.

The following is a brief account of his views. E. regarded the universe (*Tŏ Pān*) as corporeal, and as infinite in extent, and eternal in duration. He recognized two kinds of existence—that of bodies, and that of *vacuum*, or space, or the intangible nature. Of his bodies, some are compounds, and some atoms or indivisible elements, out of which the compounds are formed. The world, as we now see it, is produced by the collision and whirling together of these atoms. He also held the doctrine of perception by *images* (Gr. *eidōla*), which are incessantly streaming off from the surface of all bodies, and which are necessary to bring us into *rapport* with the world without. In like manner, he believed that sounding bodies threw off emanations, by which we are brought into sympathy with them; and that perception by smell took place in the same way. In psychology, E. was a decided materialist, holding, for various reasons, that the soul is a bodily substance, composed of subtile particles, disseminated through the whole frame, and having a great resemblance to spirit or breath with a mixture of heat.

In seeking to understand the phenomena of the heavens, E. has no scientific end in view; his sole object is to enable the mind to account for them to itself, without the necessity of imagining any supernatural agency at work. "The phenomena of the heavens," says E., "admit of various causes being assigned for their production, equally conformable to the facts learned from the senses. If, then, in thinking of any appearance, we suppose it brought about by the same cause that produces another appearance which gives no alarm or uneasiness, we are as much delivered from uneasiness as if we *saw* that such is the cause of it." E. did not deny that there are gods, but he strenuously maintained, that as "happy and imperishable beings," they could have nothing to do with the affairs of the universe or of men. "Beware," he says, "of attributing the revolutions of the heaven, and eclipses, and the rising and setting of stars, either to the original contrivance or continued regulation of such a being. For business, and cares, and anger, and benevolence, are not accordant with happiness, but arise from weakness, and fear, and dependence on others."

E. next proceeds to deal with the fear of death, Having proved in his psychology that the dissolution of the body involves that of the soul, he argues that the most terrible of all evils, death, is nothing to us, "since *when we are, death is not; and when death is, we are not*. It is nothing, then, to the dead or the living; for to the one class it is not near, and the other class are no longer in existence." Whether E. actually succeeded in removing the terrors of death by his syllogism, may be doubted.

The *positive* part of E.'s system may be noticed in a few words. He held that *pleasure* was the chief good, and it is from a misapprehension of the meaning of this word as used by E. that the term Epicurean came to signify one who indulged his sensual appetites without stint or measure. At the same time, it is easy to see that the use of the word "pleasure" was calculated to produce the mischievous results with which the later Epicureanism was charged. According to E., the sources and tests of all ethical truth are the feelings (*pathe*), and these are two, pleasure and pain. We delight in the one, and avoid the other instinctively. "When we say that pleasure is the end of life, we do not mean the pleasures of the debauchee or the sensualist, as some from ignorance or from malignity represent, but freedom of the body from pain, and of the soul from anxiety. For it is not continuous drinkings and revelings, nor the society of women, nor rare viands, and other luxuries of the table, that constitute a pleasant life, but sober contemplation that searches out the grounds of choice and avoidance, and banishes those chimeras that harass the mind." But, on the other hand, E. says: "If the means to which sensualists owe their pleasures dispelled the anxieties of the mind . . . . and enabled them to set limits to their desires, we should have no grounds to blame them for taking their fill of pleasure, wherever they could find it, provided it were attended with no pain or grief from any quarter; for that is the only evil." The whole question of ethics, then, comes to a calculation and balancing of pleasures and pains; in other words, the cardinal virtue is *prudence*. E. rests *justice* on the same prudential basis as temperance. Denying any abstract and eternal right and wrong, he affirms that injustice is an evil, because it exposes the individual to disquietude from other men; justice is a virtue, because it secures him from this disquietude. "Injustice is not an evil in itself, but becomes so from the fear that haunts the injurer of not being able to escape the appointed avengers of such acts." The duties of friendship and good-fellowship are inculcated on the same grounds of security to the individual.

Among the Romans, the system of E. was adopted by many distinguished men. Horace, Atticus, and Pliny the younger were Epicureans; and the splendid poem of Lucretius must have recommended the system to many. In modern times, Epicureanism was reuscitated in France by Pierre Gassendi, who published an account of E.'s life and a defense of his character in 1647. Many eminent Frenchmen have professed his

principles; among others, Molière, Saint Evremond, count de Grammont, the duke of Rochefoucauld, Rousseau, Fontenelle, and Voltaire.

EPICY'CLE. The earlier astronomers assumed that all the motions of heavenly bodies took place in circles, the circle being held to be the most *perfect* of all curves; and a necessary consequence of this assumption was, that the motions must have a uniform velocity. Another part of the hypothesis was, that all the heavenly bodies moved round the earth, which remained at rest in the center. The observed phenomena of the heavens, however, were soon seen to stand in glaring inconsistency with these assumptions; and to remedy this, it was necessary to have recourse to additional assumptions. For the sun and moon, which manifestly do not always move with the same velocity, the eccentric circle (q.v.) was imagined. The case of the planets, whose motions were seen to be sometimes direct, sometimes retrograde, and sometimes altogether arrested, offered still greater difficulties; to get over which, the idea of *epicycles* was hit upon. According to this hypothesis, while a planet was moving in a small circle, the center of that small circle was describing a larger circle about the earth. This larger circle was called the *deferent*, and the smaller, which was borne upon it, was called the *epicycle* (Gr. *epi*, upon). In this way the motions of the planets about the earth were conceived to be something like what the motion of the moon about the sun actually is. By assuming proper proportions between the radii of the deferent circle and the E., and between the velocities of the two motions, it was found possible to account pretty satisfactorily for the above mentioned appearances and irregularities in the motions of the planets. But it is only the irregularities arising from the revolution of the earth about the sun that can be at all explained in this way, and not those arising from the elliptic motions of the planets about the sun, nor yet the inequalities of the moon's motions. The successors of the Greek astronomers, down to Tychs Brahé, continued, therefore, to increase the number of epicycles, setting one circle upon another, until the hypothesis, in itself complicated, became still more so, and made the simplicity of the Copernican system at once striking.

EPICY'CLOID is the name of a peculiar curve. When a circle moves upon a straight line, any point in its circumference describes a cycloid (q.v.); but if the circle moves on the convex circumference of another circle, every point in the plane of the first circle describes an E.; and if on the concave circumference, a hypocycloid. The circle that moves is the generating circle; the other, the base. The describing point is not necessarily in the circumference of the generating circle, but may be anywhere in a radius or its prolongation. This curve was first investigated by the Danish astronomer Römer. It has many remarkable properties, and is even useful in the practical arts. The teeth of wheels in machinery must have an epicycloidal form, in order to secure uniformity of movement.

EPIDAM'NUS. See DURAZZO.

EPIDAU'RUS, a t. of ancient Greece, on the eastern shore of the Peloponnesus, in the district of Argolis, was situated on a small promontory, 15 stadia in circumference, in the Saronic gulf, in lat. 37° 38′ n., long. 23° 10′ east. During the most prosperous period of Grecian history, E. was an independent state. It was colonized first, it is supposed, by Carians (hence the older name of *Epicarus*, according to Aristotle), and afterwards by Ionians, but was subsequently invaded by a Dorian army under Deiphontes, the son-in-law of Temenus the Heracleide. This force dethroned Pityreus, the Ionian king of E., compelled him and his citizens to retire to Athens, and inaugurated the Dorian rule, which preserved the ascendency at E. during the whole of the historical period. The form of government was originally monarchical, but after many vicissitudes, it eventually became and remained oligarchical. At an early period, E. became one of the chief commercial cities of the Peloponnesus. It colonized the islands of Cos, Calydnus, and Nisyrus, as well as the town of Ægina, which, during the 6th c., attracted all its commerce from the then declining mother-city. E. was chiefly famous for its temple of Æsculapius, to which patients resorted from all parts of the Hellenic world, seeking cures for their diseases. The site of this temple was a plain surrounded by mountains, about 5 m. w. of the town, and which is still called Hieron, the sanctuary. E. had also numerous temples, among which were those of Artemis, Dionysus, Aphrodite, and Hera, and a magnificent theater, at present in a more perfect state of preservation than any in the Peloponnesus, and with sufficient accommodation for 12,000 spectators.

E. (modern Greek, *Epidavro*) is now a small village, with scarcely 100 inhabitants, employed for the most part in raising vegetables for the Athenian market. The plain surrounding the village is productive and highly cultivated. Here, in Jan., 1822, a congress from all parts of Greece assembled, and promulgated the constitution, known as the constitution of Epidaurus.

EPIDEM'IC (Gr. *epi* upon, and *dēmos*, the people), a disease which attacks numbers of persons in one place simultaneously or in succession, and which in addition is observed to travel from place to place, often in the direction of the most frequented lines of communication. Many E. diseases are also contagious, and all of them suggest the necessity of careful inquiry into the ventilation, drainage, food, drink, and habits of the persons liable to be affected. In presence of an E., it is proper to take unusual precautions to

preserve the public health (see article HEALTH), and not unfrequently the organization of a regular house-to-house visitation of the locality is calculated to do much good, by directing the minds of the poor and ignorant to their duties in respect to themselves and to each other. See ENDEMIC for further observations on this subject; also CONTAGION, INFECTION, FEVER, CHOLERA, etc.

EPIDEMIC CEREBRAL MENINGITIS is a disease which has been noticed and described by many American physicians since the year 1811, when Dr. North specially drew the attention of the profession to it. In 1838–40, it appeared in France, and committed great ravages in Versailles, where the mortality was 28 per cent; in Strasburg, where the mortality was 42 per cent; in Lyons, Nancy, and other garrison towns. The patients, in these cases, were almost entirely young conscripts; and the disease was regarded as non-infectious. In the spring of 1846, it appeared in the Dublin and Belfast workhouses, boys under 12 years of age being the only victims, while girls under similar circumstances escaped; it likewise appeared in the constabulary depot, in the same year, amongst the recruits. In 1863, it was very fatal in the United States. In 1865, it ravaged West Prussia: of 2,000 cases recorded, half died; and of 347 cases, 330 were under 14 years of age. In this epidemic, no mention is made of the purple spots which excited such alarm in Ireland; and in the United States, two forms of the disease are recognized —one marked by shock, weak pulse, purpled limbs, and coma, death happening within the first day; the other presenting signs of cerebro-spinal mischief, such as tetanoid spasms, and death here occurring in three days. Purple spots were present in 27 out of 44 cases.

We now pass to the consideration of the so-called *black death*, which, during the two years 1866 and 1867, caused such intense alarm in Ireland, and especially in Dublin. The history of this disease is as follows: A healthy medical student, aged 19, residing in Dublin, fell ill with chilliness and *malaise* about noon on Mar. 18, 1866. When he was visited in the evening, it was found that he had vomited frequently and was very prostrate; purple blotches appeared on his skin during the night, and about noon next day, he suddenly fell into stupor, and was dead at two, or about 26 hours from the apparent commencement of the symptoms. Drs. Stokes and Benson, who, with Mr. Croly, saw the case, at once recognized it as presenting a novel type of disease. A girl, aged 18, presented similar symptoms on April 2, but recovered. Fatal cases were recorded on May 12, 13, and 17. According to Dr. Mapother—from whose excellent report "On the malignant purple fever epidemic in Ireland," read before the epidemiological society in July, 1867, the materials of this article are almost entirely drawn—it appears that 63 fatal cases had been registered (up to July) in the Dublin district, exclusive of eight deaths amongst soldiers. This able physician gives the following description of the symptoms, which include two types of very different severity, and in this respect he agrees with the American observers. In the graver, life is rapidly extinguished as if by a blood-poison; in the milder, the symptoms are those of inflammation of the cerebro-spinal axis, or its membranes. Dr. Stokes, however, regards these latter phenomena as secondary to the essential disease, and believes that they will always appear, if the patient lives long enough for their development. The earliest symptoms are chilliness and a sense of impending danger, and vomiting of a persistent character soon follows. There is constipation till shortly before death, when the evacuations are involuntarily discharged. The tongue is dry; the pulse abnormally compressible, and usually over 100. The dark purple blotches, caused by the escape of dissolved hematine (coloring matter of the blood) from the smaller vessels, are situated in and under the true skin of the legs, hands, face, back, and neck. These patches vary in size from that of a pin's head to that of a walnut, and are often sufficiently raised to be detected by the touch. The skin is dusky and moist, sometimes even bathed in sweat. In some cases, stupor, and in others, delirium and intense restlessness, are the forerunners of death. The rapidity with which this disease runs its course is appalling. A healthy boy, aged 10½ years, sank in less than 5 hours from the time of his seizure; and of 41 investigated fatal cases, 14 terminated within 24 hours. Of these cases, 21 were females, and 20 males. Youth predisposes very strongly to the disease. No position in life affords exemption; one young nobleman, three medical students, two undergraduates, and several inhabitants of the lowest hovels—the seats of typhus and cholera—were amongst the victims.

With regard to treatment, almost every kind has been tried, and each has been found equally unavailing. The external application of cold to the spine and head, as advocated in various forms of disease by Dr. Chapman, deserves a trial. Dr. Mapother suggests that the disease is due, like scurvy, to the want of fresh vegetables as an article of food; and if this view is correct, it is satisfactory to feel that if this terrible malady is incurable, it is at all events preventable. A few cases of this disease have been recorded as occurring quite recently in various parts of England. They would probably have passed unnoticed but for the Dublin epidemic.

EPIDEMIC MENTAL DISEASES. When we consider how ordinary and normal thoughts and emotions spread from one man to many, and sway multitudes to the same views and actions, it is no longer a mystery that morbid conditions of the mind should become at times no less epidemic than physical diseases. Such, at least, is the fact. A

mental disorder may spread from man to man, and may involve whole nations. It depends for its propagation, like an epidemic disease, first upon external circumstances, and secondly, upon the peculiar condition or constitution of the individuals affected. Like the bodily affection, the causes which provoke the insanity and the tendency to be affected may have been in process of development for years. Both attack the weak rather than the strong; both exist for a season, and disappear. In the case of the mental malady, the external influences—those which constitute the moral atmosphere—are ignorance or imperfect knowledge, the power of one mind over another, the influence of language, the diffusion of particular opinions, the tendency to imitate. It is probable, however, that physical causes exercise an important influence in the production of such general mental conditions. In 1842 and 1844, there occurred in Germany and France, among the military, epidemics of meningitis with delirium, or inflammation of the membranes of the brain, when no moral factors were at work, but when diet, temperature, etc., were. But even where the origin cannot be so distinctly traced, the co-operation of external as well as psychical agents may be legitimately predicated. It would accordingly be illogical to limit the production of the dancing mania (q.v.), which occasionally, during several centuries, swept over Europe, to the reaction succeeding the dread of the end of the world, which had previously prevailed epidemically. An examination of about a hundred manifestations such as that alluded to, collected from various sources, demonstrates that not merely the intoxication of joy, but the most absurd forms of belief—that dreams, delusions, superstitions, corruptions of language, all instincts and passions, even movements and cries, may assume the forms, and, to a certain extent, may follow the laws of epidemic diseases. In far-distant ages, there are records of a histrionic plague, when, after a summer of intense heat, all conceived themselves players, and traversed the streets, and sunk and died, repeating verses, and exhibiting extravagant gesticulations; of whole communities being stricken with nightmare, which was so general as to be supposed and called contagious. There have been epidemics of homicidal and suicidal mania. In one age, hundreds are found possessed by Satan; in another, larger numbers converted into wolves; and in recent times, the leaping ague of Forfarshire, and outbursts of pyromania in various places, remind us that there may be still in the constitution of the human mind, and in the education and the habits of life prevailing, elements capable of realizing the catastrophe suggested by bishop Butler's question: What is to prevent a whole nation becoming mad? The instances of epidemic mental disease recorded in the following table, have been selected from a vast number of others, with a view of showing not the frequency or extent of such affection, but the range of the phenomenon through the powers and propensities of our nature.

Popular Name.	Form of Disease.	Year.	Number Affected.	Authority.
St. Vitus's—St. John's Dance...	Choreamania	1374	Hundreds	Hecker.

There appears to be no guarantee that the present and future generation shall be exempted from similar visitations, except in the universal diffusion of knowledge and sound thinking, for it is invariably in the darkness of ignorance or in the twilight of imperfect knowledge that the moral plague comes.—Hecker's *Epidemics of the Middle Ages;* Calmiel, *De la Folie considerée sous le Point de Vue Pathologique, Philosophique, Historique et Judiciaire, depuis la Renaissance des Sciences en Europe jusqu'au dixneuvième Siècle,* etc.; and *Psychological Journal, passim.*

EPIDENDRUM, a genus of epiphytic orchids, of which there are two examples in the United States, one growing upon magnolia trees. The blossoms are greenish-purple, growing in large clusters. Some of the many species in the tropics are very showy, and some have cathartic qualities.

EPIDERMIS (Gr. *epi,* upon, and *derma,* the skin), a semi-transparent membrane, containing neither vessels nor nerves, and everywhere forming an external covering to the corium or true skin. See SKIN. The E. is called in ordinary language the *scarf-skin.* It consists of two layers, chemically and morphologically distinct—viz., the *mucous layer,* which lies immediately upon the corium, and the *horny layer,* which forms the outermost surface of the body.

The *mucous layer* (known formerly as the *rete mucosum s. malpighianum*) is of a whitish or slightly brown tint (in the negro, dark gray or black), and is composed of small soft cells. The innermost of these cells, resting on the surface of the corium, are elongated and arranged perpendicularly; upon these follow elongated or roundish cells in many layers, which, in proportion to their distance from the corium, acquire, from

their mutual pressure, a polygonal form, which may even be recognized in individual cells.

All the cells in the mucous layer are nucleated vesicles distended with fluid, and likewise containing minute granules, which diminish in number in the more external cells.

The *horny layer* forms the external semi-transparent part of the E., which in the white races is colorless, and is composed almost wholly of uniform cells, metamorphosed into plates or scales. The deepest plates in some degree resemble the uppermost cells of the mucous layer; but in the second or third layer we find the flattening commence; till at length, after a gradual series of modifications, we have the hard, horny scales which occur on the surface, where they are regularly cast off with more or less rapidity, and replaced by those beneath them.*

The color of the E. differs in different persons and in different parts of the body. It is deepest around the nipple, especially in women during pregnancy and after they have borne children. A more or less dark pigment is often deposited, in persons who are exposed to the sun, in the face, neck, back of the hands, etc. These tints are not produced by special pigment-cells, but are seated in the common cells of the mucous layer, round whose nuclei granular pigment is deposited. In the negro and the other colored races, it is also only the E. which is colored, while the *corium* completely resembles that of Europeans. The perpendicular cells are the darkest, and form a sharply marked fringe at the edge of the clear corium. To these succeed brown cells, which accumulate in the depressions between the papillæ, and as we approach the horny layer, we have yellowish cells. The horny layer of the negro also inclines to a yellow or brownish tint.

Morbid coloration of the E. (freckles, mother's marks, etc.) is produced in the same way as the color of the negro's skin. Numerous instances of partially or entirely white negroes and of black Europeans, not as a consequence of change of climate but as an abnormal condition of the skin, are on record.

The thickness of the E. varies extremely. While upon the cheeks, brow, and eyelids, it varies from $\frac{1}{75}$th to $\frac{1}{50}$th of a line, on the palm of the hand it ranges from $\frac{1}{4}$d to $\frac{1}{2}$ a line, and on the sole of the foot sometimes even exceeds a line. In some parts of the body the horny layer is thicker than the mucous; in other, the mucous is the thicker of the two. As the chief use of the E. is that of affording protection to the soft and tender subjacent parts, it attains its greatest thickness on those portions of the body (the palm of the hand and the sole of the foot) which are most exposed to pressure and friction.

In *plants*, as in animals, the E. is formed of flattened cells, of which also new layers are continually produced from the bark below, whilst the outer ones dry up, lose their vitality, and peel off, crack and split off, or otherwise become separated from the living organism. The cells of the E. are often enlarged outwards, so as to form projections, sometimes very slight, sometimes elongated into hairs (q.v.). Glands (q.v.) are also connected with the E., sometimes by the intervention of hairs, sometimes without, and in this way it contributes to the secretion of substances formed in plants by the wonderful chemistry of nature, and on which their value to man often greatly depends. The cells of the E. are usually filled with a colorless fluid, but resinous and waxy substances are sometimes found in them, and sometimes silica (as in grasses and equisetaceæ), sometimes carbonate of lime (as in the *charas*). The epidermis is pierced by *stomata* (q.v.). When the E. of plants is subjected to prolonged maceration, it can often be made to separate into two parts; one, which is more strictly called the E., being the inner, lower, and thicker membrane; the other, which is called the *pellicle* or *cuticle*, being very thin, and extending continuously over every part of the plant except where it is pierced by the stomata. Thus, this superficial pellicle invests even the finest hairs. In some of the *algæ*, it seems to constitute the whole integument. In the greater number of plants, the E. is thin and soft, but sometimes it is thick, and sometimes hard.

EP'IDOTE, a mineral allied to garnet, composed of silica and alumina, with a considerable proportion of lime, or of peroxide of iron, or of peroxide of manganese. These diversities of composition constitute three very distinct varieties; and of these there are sub-varieties, differing in color and other particulars (*pistacite, bucklandite, withamite, zoisite*, etc.). E. is sometimes found massive, foliated, columnar, granular, or incrusting; often crystallized. Its crystals are prisms, variously modified. Its prevalent colors are green, yellow, and gray, but some of the varieties are red and black. It is found in gneiss, syenite, trap, and other rocks in a number of localities in Scotland, and in many parts of the world.

EPIGÆA REPENS. See ARBUTUS.

EPIGAS'TRIUM (Gr. *epi*, over, and *gastēr*, the stomach), the part of the abdomen (q.v.) which chiefly corresponds to the situation of the stomach, extending from the

* In reptiles and amphibians, this layer is periodically cast off in a more or less entire state, a new one being previously formed beneath it; and in man, desquamation in large patches often occurs after certain diseases, especially scarlatina.

sternum towards the navel or umbilicus (q.v.), and bounded on each side by the hypochonders (q.v.). It is called in popular language the pit of the stomach.

EPIGENESIS (Gr. *epi*, upon, and *genesis*, a formation), a formation upon, or in addition to, previously existing parts. The word is applied in physiology to that theory of new formations in organized beings which supposes them to spring from superadded centers of vital activity, as opposed to the theory which presumes that the new is formed by a development or modification of the old structure. See REPRODUCTION.

EPIGLOTTIS. See LARYNX.

EPIG'ONI, in general, sons of descendants, applied more particularly to certain mythical chiefs who fought against Thebes. After the catastrophe which brought about the death of Jocasta and the blinding of Œdipus, Eteocles, and Polynices, the sons of Œdipus and Jocasta incurred the wrath of their father, whom they sent forth alone and blind to fight with poverty. The father's curse rested on them, and resulted in the famous "war of the seven against Thebes." All the chiefs who led the war were slain except Adrastus. A second war was undertaken by the children of the fallen chiefs, and this is known as the "war of the Epigoni." The Epigoni were victorious, and Thebes was taken, Thersandrus, the son of Polynices, being seated on the throne of Cadmus. In literary history, the term E. is sometimes applied to a scholar who limits himself to unfolding the ideas of the great masters of a previous age.

EPIGRAM, a word derived from the Greek, and literally signifying an "inscription." In point of fact, the epigrams of the Greeks were simply inscriptions on tombs, statues, and monuments, written in verse, and marked by great simplicity of style, but having nothing in common with what now passes under the name. It was among the Romans that the epigram first assumed a satirical character. Catullus and Martial are reckoned the best Latin epigrammatists. In modern times, an epigram is understood to be a very short poem, generally from two to eight lines, containing a witty or ingenious thought expressed in pointed phraseology, and in general reserving the essence of the wit to the close, as the serpent is fabled to keep its sting in its tail. The French excel all other nations in this kind of poetry. Their earliest epigrammatist of any note was Clement Marot (1495–1544); their best are Boileau, Voltaire, and Piron. The epigrams of German writers are for the most part happily expressed moral proverbs but the *Xenien* of Schiller and Goethe contain not a few sharp and biting verses of a satirical character. In Britain, Pope, Burns, Byron, Moore, and other writers have shown a remarkable power of epigrammatic satire.

EPIGRAPH (Gr. *epi*, upon, and *graphe*, I write), a terse inscription placed upon architectural or other monuments, for the purpose of denoting their use or appropriation, and very frequently worked in and forming part of their ornamental details.

EPILEPSY (Gr. *epi*, upon, and *lambanō*, future, *lēpsō*, I seize), a form of disease characterized by sudden insensibility, with convulsive movements of the voluntary muscles, and occasionally arrest of the breathing, owing to spasm of the muscles of respiration, and temporary closure of the glottis (q.v.). E. was called by the ancient Greeks the "sacred disease." Owing to the mysterious and extraordinary character of the convulsion of E., it was always, in ancient times, supposed to be due in a very special manner to the influence of the gods, or of evil spirits; Hippocrates, however, combats this idea in a special treatise, in which he maintains that E. is no more and no less divine than all other diseases. The same idea of the specially supernatural character of E. is shown forth in the deeply rooted oriental notion of demoniac possession. See DEMONIACS. E. is often called, in modern language, the "falling sickness," and this name is not only descriptive of one of its most striking phenomena, but also points distinctly to the most obvious danger of the fit. The patient is seized, without reference to his condition or occupation at the moment, with insensibility, often so complete and sudden as to lead to serious accidents and bodily injuries; in the most aggravated cases, he has no premonitory sensations whatever, but falls down without any attempt to save himself, and usually with a wild inarticulate cry of some kind, immediately after which the face is violently distorted, the head drawn towards one or other shoulder, and the whole body convulsed. These convulsions follow in rapid succession for a few minutes, and are attended by foaming at the mouth, and by great lividity, or, in some cases, livid pallor, which, with the irregular spasmodic movements of the lips, nostrils, and eyes, give a frightfully ghastly expression to the countenance, and almost invariably lead the bystanders to an exaggerated idea of the immediate danger of the fit. The immediate danger is, in reality, not great, excepting that the sudden attack may lead to an injurious or fatal fall; the tongue, however, may be bitten if protruded during the convulsion, or the patient may be so placed as to injure himself seriously by the repeated and unconscious movements of his body, or he may suffocate himself by accidentally falling with his face in water, or otherwise closing up the mouth and nostrils, or by dragging upon a tightened neckcloth. Care should be always taken to avoid these accidents by keeping the epileptic as much as possible within view of persons acquainted with his condition, and able to give such assistance as may be required; as well as by warning the patient himself to avoid all places in which a fall would be especially dangerous. But when an unskilled person happens to witness a fit of E.,

he will do well to remember that beyond the simplest and most obvious precautions against the dangers mentioned above, there is literally nothing to be done; and any attempt to rouse the patient by violent stimuli, as ammonia applied to the nostrils, or by dashing water in the face, or, still more, by administering medicines hastily recommended by the ignorant and thoughtless, is almost certain to do more harm than good. The tongue should be looked to, a piece of cork or other gag being, if necessary, inserted between the teeth; the patient should be then placed on a mattress or other soft place near the ground; his neckcloth should be removed, and the dress loosened round the chest; the head should be, if possible, a little raised, and a free circulation of air maintained (this last precaution being very apt to be neglected in case of a crowd); with these things done, it may be safely affirmed that in the vast majority of epileptic cases nothing has been left undone which will conduce to recovery. The ordinary course of the fit (which usually lasts from five to twenty minutes altogether) is as follows: the convulsions gradually diminish in intensity, and the patient passes into a state of deep but motionless stupor, with dilated pupils, and sometimes, but not always, with snoring or noisy breathing; the foaming at the mouth ceases, the color gradually returns, and this state leads to recovery through a more or less protracted, but apparently natural sleep, the patient, on awaking, being often quite unconscious that he has been the subject of any anxiety, or, indeed, in any unusual condition whatever. Although in all cases of true E. there is a stage of complete coma (q.v.), or unconsciousness, yet the fit is often very transient, and but little attended by convulsion, being also less sudden than above described, and not necessarily causing a fall to the ground; in some cases, also, fits of greater intensity are preceded by certain premonitory symptoms or peculiar sensations, which act as warnings to the patient himself, and lead him to place himself in a position of safety on the approach of the paroxysm. Having in view these distinctions (which are certainly of considerable practical importance), the French language, both popular and scientific, has adopted the terms of *grand mal* and *petit mal* (i.e., great and little evil), as characterizing the more and less dangerous forms of E. respectively. The sensations which precede the fit in some epileptics have been termed in Latin the *aura* (i.e., breath) *epileptica*, from their supposed resemblance to a current of cold air passing over the body, and proceeding from the extremities towards the head. This description does not, however, hold good in all cases; and not unfrequently, as mentioned above, there is no *aura*, or unusual sensation of any kind, preceding the fit. It must be mentioned, however, as bearing on treatment, and as being quite within the bounds of popular medicine, that some of the most ancient authorities assert strongly the power of a tight bandage, placed suddenly upon the limb in which the aura begins, to cut short, or even to prevent altogether, the fit of epilepsy. Although this alleged fact has often been regarded as doubtful, it has never been altogether discredited, and has of late years been brought into renewed notice by good observers. It is even maintained that such a bandage, placed experimentally upon one or other of the limbs, and tightened on the approach of a fit, has been found effective in some cases in which there was no distinctly local sensation; and epileptics have been repeatedly convinced of the propriety of habitually wearing a bandage loosely applied upon the arm, which they have been able, by carefully watching their own sensations, and by being watched in turn by others, to get tightened at the proper time. There is no doubt room for fallacy in these observations, but they may safely be commended to notice, as involving no possible risk of mischief, and as far more worthy of extended trial than the great majority of popular remedies in epilepsy.

But the fit and its treatment form only a part of the anxieties which arise out of a case of epilepsy. The ultimate danger of the disease has little relation to the severity of the individual fits, except in the modified sense explained above; the frequency of the attacks being apparently much more apt to influence the duration of life than their character. Indeed, although epileptics may survive several severe paroxysms at distant intervals, and recover in the end with an apparently unbroken constitution, it rarely happens that very frequently repeated attacks, even of the *petit mal*, are unattended by some permanent depreciation of the powers of mind or of body. The most frequent, perhaps, of all the more serious consequences of confirmed E. is insanity (q.v.), sometimes assuming the form of acute mania or monomania following the attacks, but quite as frequently tending to gradual imbecility without any acute seizure. Sometimes the development of the epileptic insanity, or dementia, is attended by palsy, and other indications of structural disorder of the brain; in other instances, no such consequences occur, and the brain after death may be found to have very little tangible disease, or only such disease as is found in numerous other cases of functional derangement. Very often, even when the mind remains tolerably entire, there is loss of memory, and a certain want of acuteness and depression of spirits, which unfit the individual for the regular business of life. Disorders of the digestion are also not uncommon; and there is frequently a want of tone and vigor in all the bodily functions, which communicates a habitual expression of languor and reserve to the epileptic. Added to this, it can hardly be matter of surprise that the knowledge of his infirmity should deeply influence the mind of the epileptic, and produce a distaste for active occupations, especially for such as expose him to more than ordinary observation.

The causes and the radical cure of epilepsy are almost equally involved in mystery.

It has been supposed by some to be dependent on an increased afflux of blood to the brain; while by other observers and pathological authorities it has been attributed, with about equal force of reasoning, to precisely the opposite condition. Certain cases undoubtedly depend upon organic disease, as tumors or injuries to the brain and its membranes, more especially near the surface. Local sources of irritation in other parts of the body have also been supposed to be exciting causes of E.; and cases are recorded in which the disease has been cured by the amputation of a finger or the division of a nerve. The attention of recent observers has been especially directed to the medulla oblongata and spinal cord (q.v.), as being the most probable physiological seats of a disease so decidedly marked by convulsive movements. But as yet little more than the most vague theoretical inferences can be drawn from their researches as to the cause either of the morbid tendency in E. or of the paroxysm. One of the most curious and suggestive of these recent facts is the experiment of Brown-Sequard, showing that E., or a state closely resembling it, may be induced in certain animals by division of certain portions of the spinal cord, the artificial disease continuing long after the primary effects of the injury have ceased. A still more curious and inexplicable phenomenon has resulted from the multiplication of such experiments; for Brown-Sequard has shown that in Guinea-pigs this artificial E. is sometimes propagated to the offspring, becoming, like the natural disease, a hereditary and congenital morbid tendency. On these strange facts it would be premature to indulge in speculation in this place, but their great importance can hardly be overlooked.

The condition of the epileptic seems to be favorably affected by everything which conduces to a quiet and hopeful state of the mind, and to a vigorous condition of the body. The treatment of the disease should therefore, in general terms, be of the kind termed *tonic* (q.v.), and should be adapted with care, and after very minute and careful inquiry, to the removal of all the special bad habits, and occasional causes of depression, which tend to bring the system into a condition *below par*, in the individual case. The influence of a happy and quiet domestic life, without unhealthy excitement, and with proper occupations, varied by amusement and exercise in the open air, can hardly be overestimated. The marriage of epileptics is, however, not too readily to be sanctioned, as it has been known to be followed, not only by an increase of the disease, but by its transmission to a considerable portion of the family. On the other hand, a too absolute rule on this subject is not without its dangers, and perhaps the practical difficulties of the question are not to be met by any defined or dogmatic expression of opinion, founded on the general pathology of the disease. If the tendency exist, even slightly developed, upon both sides in such a connection, it needs hardly be stated that the dangers of transmission to the descendants is increased in a very great degree. Hence, intermarriages *within epileptic families* must be regarded as always in the highest degree imprudent. Parents and guardians are undoubtedly justified in making this disease an object of special solicitude, and reserve or concealment on this subject on either side, in the case of a proposed marriage, should be regarded as equally dishonorable with any other form of deception in a matter so important to the welfare of society and of the parties concerned.

According to one of the oldest and most respected of American physicians (Dr. Jackson, of Boston), the epileptic tendency may often be successfully treated by the systematic use of an exclusively vegetable diet, or by a very considerable reduction of the proportion of animal food. Among the innumerable remedies recommended by authorities, the salts of iron and zinc have perhaps the largest amount of experience in their favor; and counter-irritants (q.v.) applied to the nape of the neck, or between the shoulders, either by blistering, the use of the seton, or even actual cautery, has been often followed by prolongation of the intervals, or decrease in the severity of the fits. Almost all the accredited remedies, however, have been observed to produce a temporary relief of this kind, even when without any permanent influence on the course of the disease.

Some of the *lower animals* are subject to epileptic fits. The disease is common in dogs and highly-bred pigs. The creatures writhe with involuntary spasms, and are for the time without sight or hearing. Sometimes the muscles of the throat are so involved that fatal suffocation occurs. The attack is generally preceded by dullness, and lasts from ten to thirty minutes. It is generally traceable to torpidity or irregularity of the bowels, worms, debility, or plethora. In dogs, it is a frequent sequel of distemper. In cattle, it usually occurs in connection with the engorgement of the first or third stomachs; they throw themselves violently about, bellowing loudly, but seldom die. It is rare in horses, and differs from megrims, for which it is often mistaken, but in which there are no spasms. The treatment consists in freely opening the bowels, removing worms, if any are present, enjoining bleeding and spare diet, if the patient's condition is high, and generous feeding and tonics where it is low. The best preventives are carefully regulated diet, an occasional laxative, with a course of tonics, and especially of arsenic.

EPILO'BIUM, a genus of plants of the natural order *onagraceæ*, having four deciduous calycine segments; four petals; a much elongated, 4-sided, 4-celled, 4-valved, many-seeded capsule; and seeds tufted with hairs at one end. The species are herbaceous

perennials, natives of temperate and cold countries, and very widely diffused both in the northern and in the southern hemisphere. Some of them are very ornamental, from the beauty of their flowers. Most of the British species have small flowers, and some of them are very common in moist places. *E. angustifolium*, which differs from all the other British species in having the petals dissimilar in shape and size, is frequently planted in gardens and shrubberies, on account of its numerous and beautiful rose-colored flowers; but its creeping roots are apt to overrun a flower-garden. It is sometimes called FRENCH WILLOW, from the resemblance of its stems and leaves to some kinds of willow, and the name WILLOW-HERB is often extended to the whole genus. It is found in very northern regions, and its leaves and young shoots are sometimes a grateful addition to the meals of the arctic traveler, although not likely to be relished in almost any other circumstances. The pith, when dried, yields a quantity of sugar to boiling water, and is used in Kamtchatka for making a kind of ale, from which also vinegar is made.

EPILOGUE (Gr. *epi*, upon or after, and *logos*, a speech) means, in oratory, the summing up or conclusion of a discourse; but, in connection with the drama, it denotes the short speech in prose or verse which frequently, in former times, was subjoined to plays, especially to comedies. The E. was always merry and familiar in its tone, and was intended to establish a kindly understanding between the actor and the audience, as well as to conciliate the latter for the faults of the play, if there were any, and to send them away in good humor. One of the neatest and prettiest epilogues ever written, and one which completely realizes what an E. should be, is that spoken by Rosalind at the conclusion of Shakespeare's *As You Like It*.

EPIM'ACHUS, a genus of birds of Australia and Papua, not unlike the bird of paradise; in color, violet black or black brown, with a collar of feathers margined with green at the base of the neck. The tail feathers consist of about 12 long plumes ending in thread-like points. The head and breast are brilliant blue.

EPIMEN'IDES, a Greek poet and priest, b. probably at Phæstus in Crete, in the 6th or 7th c. B.C., and lived at Cnossus. His history has only reached us in a mythical form. He is said to have fallen asleep in a cave when a boy, and not to have wakened for 57 years. Like Rip Van Winkle, he was naturally much astonished and perplexed on his return to broad daylight. His period of slumber, however, had not passed away unprofitably. His soul, disengaging itself from its fleshly prison, betook itself in the interval to the study of medicine and natural philosophy; and when it had shuffled on again its mortal coil, E. found himself a man of great knowledge and wisdom. Goethe has written a poem on the subject, *Des Epimenides Erwachen*. E. went to Athens about 596 B.C., where, by the performance of various mystical rites and sacrifices, he stayed a plague with which the inhabitants were afflicted. When he died is not known, but we may be certain that he did not live (as is fabled) for 299 years. That he wrote the epic poems attributed to him, the longest of which was on the Argonautic expedition, is considered highly improbable. Compare Heinrich, *E. aus Kreta* (1801).

EPINAL, a t. of France, in the department of Vosges, is situated in a delightful district at the western base of the Vosges mountains, on both banks of the Moselle, about 200 m. e.s.e. of Paris. Lat. 48° 10′ n., long. 6° 26′ east. It is a well-built, handsome town, with clean, regular, though badly-paved streets, and is surmounted by the ruins of an old castle, the gardens attached to which are much admired. Among its chief buildings are the parish church, an antique Gothic structure; the hospital, formerly a capuchin convent; a museum of pictures, antiquities, and natural history; the barracks; and the residence of the prefect of the department. E. manufactures chemical products, lace, block-tin, wrought-iron, pottery, cutlery, paper, and leather, and has some trade in grain, wine, timber, etc. Pop. '76, 13,827.

ÉPINAY, LOUISE FLORENCE PÉTRONILLE DE LA LIVE D', a French writer, b. about the year 1725. At the age of 19, she married her cousin, M. d'Epinay, but the union did not prove a happy one. While her husband was abandoning himself to dissolute courses, she sought the intercourse of philosophers and men of genius. In 1745, she formed a close intimacy with Rousseau, and presented him with a small house (the now famous Hermitage) which stood on one of her husband's estates in the woods of Montmorency. An unfortunate jealousy, however, which Rousseau conceived for Grimm, another friend of Mme. d'E., was followed by an open rupture with his benefactress, and in his *Confessions* he scrupled not to malign her by way of vengeance. She spent the remaining 25 years of her life in comparative solitude, seeing only a small and select circle of philosophers and littérateurs. When Grimm was obliged to leave Paris, she continued, under the direction of Diderot, his literary correspondence with northern sovereigns. She died in 1783. From the pen of Mme. d'E. we have *Conversations d'Emilie* (Paris, 1774), a work on education pronounced by the French academy to be the most useful that had been published for a number of years; *Mémoires et Correspondance de Madame d'Epinay, renfermant un Grand Nombre de Lettres inédites de Grimm, de Diderot et de J. J. Rousseau, etc.* (Paris, 1818); *Les Confessions du Comte de****; etc.

EPIPHA'NIUS, SAINT, a Christian bishop, and writer of the 4th c., was b. of Jewish parents in Palestine. He was baptized in his 16th year, and was educated among the Egyptian monks, who inspired him with an aversion to all liberal science. He rose

gradually to the rank of bishop of Constantia (formerly Salamis) in Cyprus, and continued in that office from 367 till his death in 403. His polemical zeal was conspicuously manifested against Origen. He had proclaimed him a heretic in his writings, and in 394 he went to Palestine, the focus of Origen's adherents, and called upon John, bishop of Jerusalem, and the two monks, Rufinus and Jerome, to condemn him. A more legitimate object of his violent opposition was the increasing worship of images. Jerome relates how he indignantly tore down an image in the precincts of a church in Palestine, as being contrary to the divine law. Among his writings, collected by Petavius (2 vols., Paris, 1622), the most important is his *Panarion*, or catalogue of all heresies (80 in number), a work which strikingly shows his unfitness for being a historian. His credulity and want of honesty are excessive.

EPIPH'ANY (Gr. *Epiphaneia*, appearance), denoted, among the heathen Greeks, a festival held in commemoration of the appearance of a god in any particular place. The word subsequently passed into the usage of the Christian church, and was used to designate the manifestation or appearance of Christ upon the earth to the Gentiles, with especial reference to the day on which he was seen and worshiped by the wise men who came from the east. This occasion is commemorated in the church on the 6th of Jan., the 12th day after Christmas, and hence the E. is also called twelfth day. The E., which is said not to have been observed as a separate festival, but to have been included in the feast of the nativity till 813, is observed as a "scarlet day" at Oxford and Cambridge.

EPIPHE'GUS, a parasitic herb growing from the roots of the beech tree, and seeming to grow from the ground independently. It is 6 to 12 in. high, purple or yellow-brown, slender, with scales instead of leaves. In Virginia it is called "cancer-root," and has the reputation of being a specific for that disease.

EP'IPHYTES (Gr. *epi*, upon, *phyton*, a plant), often and popularly, but less correctly, called air-plants, are plants which are not rooted in the ground, but are attached to trees, from the decaying portions of the bark of which, or of mosses and lichens which grow upon it, they derive their nutriment, probably, also, depending upon the air for it to a larger extent than other plants do. Mosses and lichens, themselves, growing upon trees, may be called E., but the term is generally used of phanerogamous plants. E. are not connected with the trees upon which they grow in the peculiar manner of the mistletoe, *balanophora*, and other true parasites—not sending roots like them into the wood to suck the juice of the tree. It is chiefly in warm climates that phanerogamous E. are found and in those which are also moist. Most of them prefer shady situations. Within the tropics, they often form an interesting and remarkable feature of the vegetation. Some of the *bromeliaceæ* (as *tillandsia*), *cactaceæ*, *araceæ*, *gesneraceæ*, and other natural orders are E.; but the order to which they belong more than to any other is *orchidaceæ*. Many of the epiphytous orchids, as well as other E., are remarkable for their beauty; and the attention which has recently been given to their cultivation in hothouses has been rewarded by the most perfect success. See ORCHIDS. Plants which usually occur as E. are sometimes also found growing on rocks. Although seldom found except in moist climates, E. are generally capable of enduring a considerable amount of drought, parting slowly with the moisture which they have once imbibed.

EPI'RUS, the ancient name of a part of Greece, bounded on the e. by the chain of Pindus, on the s. by the Ambracian gulf, on the w. by the Ionian sea, and on the n. by Illyria and Macedonia. It formed the southern part of modern Albania, or the pashalic of Janina, a wild and mountainous region, the haunt of robbers and semi-civilized tribes in all ages. The chief town was Dodona (q.v.); the chief rivers, the Acheron, Cocytus, Arachthus, and Charadrus. Anciently, it was celebrated for its cattle and its breed of Molossian dogs. Its earliest inhabitants were probably Pelasgians. In the historic period, Theopompus speaks of fourteen tribes, most of whom were believed by the Greeks themselves to be not of Hellenic origin. The principal were the Chaones, Threspoti, and Molossi, the last of whom finally obtained the entire sovereignty of the country. Of the Molossian kings of E., the most distinguished was Pyrrhus, who long waged successful war against the Romans. But after this race of kings became extinct (239–229 B.C.) by the death of Ptolemy, grandson of Pyrrhus, a republican constitution was adopted, whereupon parties sprang up among them, and the neighboring Macedonians got the upper hand. On the conquest of Macedonia by the Romans (168 B.C.), the Epirots were accused of having assisted Perseus, the Macedonian king, and the most revengeful measures were put in force against them. Æmilius Paulus, the Roman gen., plundered and razed to the ground the 70 towns of E., and sold into slavery 150,000 of the inhabitants. From this period, E. shared the vicissitudes of the Roman and Byzantine empires, until 1204, when one of the Comneni made himself independent. His dynasty ruled the country until 1466, when it was finally conquered by the Turks (see SCANDERBEG). E., peopled largely since the 14th c. by Albanians (see ALBANIA), formed latterly a part of the Turkish vilayet of Janina. The Berlin congress of 1878 recommended that the southern part of E. should be ceded to Greece.

EPIS'COPACY (Gr. *episcopos*, bishop or overseer) is that form of church government in which one order of the clergy is superior to another—namely, bishops or prelates to

priests or presbyters, the ordinary ministers of parishes or congregations. It is sometimes called *diocesan episcopacy*, to distinguish it from that *episcopacy* which Presbyterians and Independents also assert—the oversight of flocks by their pastors. See BISHOP. It is not essential to E. that there should be *archbishops*, exalted in rank and authority above other bishops, although of the same order: and in some Episcopalian churches there are none.

E. has actually subsisted under very various modifications; the power of bishops being more or less absolute, or more or less controlled by synods of presbyters, or even —in the Protestant Episcopal church of the United States—by a diocesan convention, composed both of presbyters and lay delegates. The power of the bishop is also variously affected by the relations subsisting between church and state; and great differences exist in this respect between the church of England, the church of Sweden, and the church of Denmark, all Episcopalian, and all connected with the state as *established* churches.

The church of Rome, the Greek church, and other branches of the eastern church, are Episcopalian. Of Episcopalian Protestant churches not established, the most important are that in the United States, that in Scotland, and the Moravian church. See ANGLO-CATHOLIC CHURCH; and ENGLAND, CHURCH OF.

EPISCOPACY. 1. After much discussion, standard writers on both sides of the question now admit that the term "episcopos," when it appears as a term of office in the New Testament, is synonymous with "presbyter," the same officers of the church being called by both names—the one with reference to their duties, and the other to their age. The "presbyters" or elders of the Ephesian church were called by Paul "bishops" or overseers of the flock. In the pastoral epistles, both words are used interchangeably. Peter, exhorting the "presbyters" as their brother "presbyter," speaks of their office as that of an overseer or "bishop." 2. In each church of the new testament there seems to have been, at first, a plurality of presbyters or bishops. In the church of Ephesus (as has just been said), there were presbyters who were bishops. In the church at Philippi, there were bishops as well as deacons. Paul and Barnabas, in their journey, ordained presbyters in every church. 3. In each church, it may be taken for granted that some one of the officers was chosen to preside. This choice, the advocates of prelacy affirm, was made at first by apostolic authority or in imitation of apostolic example. Presbyterian and Congregational writers, on the other hand, regard it as only a wise human arrangement similar to that which convenience and order suggest in all associations of men. 4. Gradually the two synonymous names of office were divided; "bishop" being restricted to the president, and "presbyters" continued to the rest. This division, the prelatical theory of church government asserts, was made by apostolic agency in the accomplishment of a divine intention that the bishop, as a successor of the apostles, should be vested with authority over the presbyters and the church. The non-prelatical theory, on the contrary, affirming that the apostles, as such, had no successors, maintains that the division of title and of function was made without apostolic agency and contrary to the spirit of the Savior's command: that it was a result of the innate tendency in human nature to exercise and to yield authority, greatly stimulated and aided by imitation of the absolute control exercised by the civil government. 5. Even after this change had taken place, the episcopal office was regarded, theoretically, as possessing equal authority and honor. But gradations of rank began at once, practically, to arise similar to the gradations in civil government throughout the Roman empire. Bishops in the country and in the smaller towns or villages became subordinate to the bishop of the adjacent city. 6. As the chief city of each district had the civil rank of a "metropolis" or mother city, so the bishop of that city, styled metropolitan from his position, took the lead in the deliberations of the local synod as "*primus inter pares*," and acted as the representative of his brother bishops in their intercourse with other churches. Thus, though all bishops were nominally equal, a superior dignity and authority came by general consent to be vested in the metropolitans. 7. A still higher dignity was assigned to the bishops of the chief seats of government—Rome, Alexandria, and Antioch; and among these the bishop of Rome, the capital of the empire, had precedence. 8. Convenience dictated that the ecclesiastical divisions should follow the civil divisions of the empire. Roman emperors saw with amazement Christianity copying their jurisdiction in every part of the land. As the struggle deepened, the Christian bishop and the Roman governor became two rival authorities, the representatives of warring kingdoms within the same domain. When Christianity, instead of being destroyed, became the established religion, and the two administrations were made one, the resemblance between them was perfected, and the gradations of ecclesiastical rank which had grown up by custom were ordained by law. The empire was divided, as to its secular government, into four prefectures; these were subdivided into dioceses, and the dioceses into provinces. The rulers of cities and districts were subject to the governor of their province; the governors of provinces to the governor of their diocese; the governors of dioceses to their prefect; and the prefects to the emperor. In like manner, the bishops of cities and districts were subjected to the metropolitan of their province: the metropolitans of the provinces to the metropolitan of their diocese; the metropolitans of the dioceses to the patriarch

of one of the chief cities (of which there were now four), Rome, Constantinople, Alexandria, and Antioch; and the patriarchs of these cities, like the prefects, had, at first, no superior except the emperor. 9. Theoretically, all these primatial sees were co-ordinate in authority and mutually independent. But by degrees the bishops of the more important cities overshadowed their brethren, and exercised a supremacy which, though due rather to custom than to recognized claims, was increasingly acquiesced in from the manifest advantage of having a strong central power which could interfere in theological controversies or ecclesiastical disputes with an authority to which all would bow. 10. As the cities, Rome and Constantinople were both capitals of the empire, so their bishops were exalted above all others. And as these two cities became rivals for the supreme place, so the two bishops contended with each other for the first place as universal bishop. 11. At length the western and eastern churches were torn asunder. With the decline of the empire, the grandeur of the eastern church was obscured, until both empire and church were overwhelmed by the Ottoman power and the Mohammedan faith. With the rise of new kingdoms and the conversion of new nations in the west, the bishop of Rome was lifted up as "the head of the universal church."

EPISCOPAL CHURCH, PROTESTANT, is the title of that portion of the Christian church in the United States which, before the revolution, was a part of the church of England. Its history is naturally divided into two periods. I. *During colonial times.* The settlement of Jamestown was commenced in 1607. Its charter required that the true word and service of God should be preached, planted, and used according to the rules and doctrine of the church of England, not only in the colonies, but also, as far as possible, among the savages around them. Rev. R. Hunt labored in his vocation with piety and zeal to the end of his life. After him, Rev. A. Whittaker acquired, by his devoted exertions, the title, "Apostle of Virginia." Under his instrumentality Pocahontas was converted and baptized. As the first colonists in Virginia were all members of the church of England, provision was made for ministerial support by allowing 1500 lbs. of tobacco and 16 barrels of flour, per annum, to each minister, and by setting apart in each new borough a portion of land for a glebe. Tithes were subsequently introduced. None but ministers who had received episcopal ordination could legally officiate in the colony. The officers and agents of the company, in their efforts to promote morality and religion, were exhorted "to employ their utmost care to advance all things appertaining to the order and administration of divine service according to the form and discipline of the church of England, carefully avoiding all factious and needless novelties, which only tend to the disturbance of peace and unity." As an endowment for a college, 10,000 acres of land were given and a large amount of money was collected. Great zeal in behalf of the conversion and education of the Indians was felt, and a strong hope was cherished that the contemplated institution would be very useful to them. But, in 1622, they conspired against the English and murdered many of them. This embittered the minds of the survivors, and arrested all plans for their advancement in education and religion. During the next half century, owing to political disturbances and other causes, religion greatly declined throughout the colony, so that in 50 parishes nearly all were destitute of glebe, parsonage, church, and minister. In 1685, Rev. James Blair came as missionary to Virginia, and having been appointed commissary to the bishop of London, exerted, during an administration of more than 50 years, a very great influence in restoring and enlarging the work of the Episcopal church. By his efforts the college of William and Mary was founded in 1692. The colony of Maryland, founded in 1633 by lord Baltimore, a Roman Catholic, with 200 families and several priests, offered free admission "to every person professing to believe in Jesus Christ." At lord Baltimore's death, in 1676, there were 10 counties and 16,000 inhabitants, the majority of whom were Protestants. On the accession of William of Orange, "a Protestant revolution" took place, and a royal governor was sent into the colony. In 1692, the church of England was established by law, the province was divided into 30 parishes, and tithes for the support of the Episcopal ministers were imposed on every inhabitant, no matter what were his religious preferences and creed. Dr. Thomas Bray was appointed commissary of the bishop of London for the province of Maryland. By his efforts before leaving England, the societies "for promoting Christian knowledge," and "for the propagation of the gospel in foreign parts," were established. After his arrival in Maryland he entered with zeal into his work, and was active in having a bill passed, in which it was provided, "that the Book of Common Prayer and administration of the sacraments, with the rites and ceremonies of the church according to the use of the church of England, the psalter, and psalms of David, therein contained, be solemnly read by all and every minister or reader in every church, or other place of public worship, within this province." Dr. Bray's actual residence in Maryland was soon interrupted, but his zeal in behalf of the church of England, as established therein, continued to the close of his life. At this date a majority of the inhabitants are reported as in communion with that branch of the church.—In the colonies of Carolina and Georgia Episcopal churches were planted and continued to flourish. New York was first colonized by the Dutch in 1615, and, in its religious opinions and forms, was Presbyterian. In 1664, it was seized by the English. After this, precedence was given to the church of England, and a tax levied for its

maintenance. Trinity church, New York city, was founded in 1696; its first rector, Rev. W. Vesey, was also for half a century commissary of the bishop of London. This corporation is now celebrated for its great wealth. In New Jersey the early settlers were principally Quakers, Presbyterians, and Congregationalists; but all other Christians enjoyed entire religious liberty. Missionaries of the society for propagating the gospel worked earnestly and with good effect in the establishment of Episcopal churches. In Pennsylvania the first church of this order was Christ's church, Philadelphia, founded in 1695; and at various other points missionaries of the English society engaged in successful work. The first colonies of New England, composed chiefly of English Puritans and Separatists, who came to America mainly to escape the restrictions and oppressions to which they had been subjected by church laws at home, sought to exclude episcopacy. Because of the severe measures adopted for this purpose, and from other causes, for 60 years after the landing of the pilgrims there were no Episcopal churches in New England. In 1679, Charles II., on the earnest representation of some of the inhabitants, had one built in Boston. From that time, through the efforts of the English missionary society, some progress was made. Missionaries were sent to various points, who were honest, faithful, and laborious in traveling and preaching the gospel. If the church of England had appointed bishops for the colonies, the growth of the denomination therein would doubtless have been greater and more rapid. II. *After the attainment of national independence.* At the beginning of the revolution there were in the middle and eastern states about 80 Episcopal ministers, many of whom had received a large part of their support from the English society. After the war, aid from that source was, of course, withdrawn. Many of the ministers and people had adhered to the crown during the struggle, and at its close left the country. Soon after, the landed endowments of the church of England in Virginia were lost, and Episcopalians were thrown on their own resources. They were poor, and their prospects were not bright. Two things were necessary—to secure union among the churches of the several states, and to obtain bishops. The first was accomplished by the formation of the general convention, which has ever since been accepted as the governing body of the Episcopal church in the United States. The first American consecrated to the episcopal office was bishop Seabury, who, about 1785, obtained consecration from Scottish bishops. In 1789, William White and Samuel Provoost were consecrated, by the archbishop of Canterbury and other English bishops, as bishops of Pennsylvania and New York; and, in 1790, James Madison was consecrated, also by English bishops, as bishop of Virginia. In arranging the order of common prayer the English prayer-book was retained, with such alterations as the political changes had made necessary, and with some other modifications. It came into immediate use, and has since been maintained without material alteration. The Episcopal church having thus early organized itself in accordance with the new life of the country, soon began to increase. It is now strong in large cities and flourishing towns; has many adherents among persons of wealth and culture; and, aided by its complete and zealous organization of the church as a missionary society, not only continues to increase in the older states, but also extends its churches and dioceses over all parts of the land. It is steadily subdividing its dioceses, and is considering the expediency of arranging them all, according to geographical position, into four provinces, to be united under a council that shall meet once in a fixed term of years. The doctrine of the American Episcopal church is that of the church of England, "which while it receives the Holy Scriptures as the ultimate rule of faith, does not throw them open to the varying interpretations of every man's private judgment, but explains them by the creeds, by definitions of Christian doctrine made by the general councils, and by the aid of traditions which it believes to have come down through an unbroken line of teachers from the apostles themselves." The growth of this church during the present century is shown in the following table:

Years.	Number of Dioceses.	Bishops.	Presbyters and Deacons.	Total.
1820	15	9	301	310
1830	20	11	514	525
1840	27	19	1,040	1,059
1850	29	32	1,557	1,589
1860	33	43	2,113	2,156
1870	39	52	2,786	2,838
1879	48	61	3,314	3,375

The following statistical summary, taken from the *Church Almanac* for 1880, gives the figures for 1879 so far as reported:

Dioceses	48
Missionary districts (including Africa, China, and Japan)	13
Bishops	61
Priests and deacons	3,314
Whole number of clergy	3,375

Parishes, about							2,900
Ordinations (in 32 dioceses and 2 miss. districts)							180
Candidates for deacon's orders (in 34 dioceses and 4 miss. districts)							303
Baptisms	(" 42	"	" 8	"	"	)	40,296
Confirmations	(" 43	"	" 8	"	"	)	24,652
Communicants	(" 48	"	" 10	"	"	)	322,713
Sunday-school teachers	(" 41	"	" 5	"	"	)	27,547
Sunday-school scholars	(" 42	"	" 8	"	"	)	253,137
Contributions	(" 40	"	" 8	"	"	)	$6,068,272

EPISCOPAL SYSTEM, in the Roman Catholic church, is the name given to the theory which vests the supreme ecclesiastical power in the whole body of bishops. It was urged most powerfully in the conflicting papal elections which occurred during the 14th century. All who adopted it declared that the general councils of the church were above the pope. Among this class the university of Paris and the Gallican church were conspicuous. The theory continued to spread, also, in Germany, where Nikolaus von Hontheim, co-adjutant bishop of Treves, was one of its chief supporters, and, in 1763, wrote his celebrated book concerning it. In 1785, the archbishops of Treves, Mayence, Cologne, and Salzburg, agreed in demanding from the pope the restoration of the episcopal privileges which had formerly been vested in the German archbishops. But the declaration of the infallibility of the pope by the Vatican council has put an end to all debate on the subject, and, for the present at least, made the episcopal system impossible in the Latin church.

EPISCO'PIUS, SIMON (whose Dutch name was Bisschop), the head of the Arminian party after the death of Arminius, was b. at Amsterdam in 1583, studied at Leyden, took his degree in 1606, and was ordained pastor of the village of Bleyswyck near Rotterdam in 1610. In the following year, the states-general, with the intention of putting an end to the agitations created by the controversies between the Gomarists or Calvinistic party and the Arminians or Remonstrants, ordered a conference to be held in their presence at the Hague between six ministers of each party. E. was one of the six charged with the advocacy of Arminianism, and highly distinguished himself by his good temper, ability, and learning. In 1612, the curators of the university of Leyden appointed him professor of theology in the room of Gomar, who had gone to Seeland. This enraged the leaders of the orthodox party, who unscrupulously accused him of Socinianism, and of having entered into an alliance with the Roman Catholics for the destruction of Protestantism. By this means the fanaticism of the populace was roused against him; he was insulted and abused in the street, and on one occasion narrowly escaped being stoned to death. The house of his brother in Amsterdam was also sacked, under the pretext that it was a rendezvous of the Remonstrants. In 1618, occurred the famous synod of Dort (q. v.). E. was present, along with several other Arminians. The Calvinists, who happened to be in an overwhelming majority, would not allow him to speak; they told him that the synod was met not to discuss, but to judge; and, in fact, the whole proceedings exhibited as revolting a specimen of high-handed tyranny as any on record, even among ecclesiastical tribunals. Expelled from the church, and banished from the country, E. betook himself first to Antwerp, and afterwards to Rouen and Paris, but in 1626 returned to Rotterdam, where the *odium theologicum* against his party had become less virulent. Here he married in 1630, and four years after was made primarius professor of divinity in the newly-established college of the Remonstrants. He died in 1643. E. held enlightened principles in regard to religious toleration. Not placing a high value on merely doctrinal views, but rather believing in the efficacy of the Christian spirit to elevate and purify the character, and seeing, moreover, the presence of this spirit in men holding the most conflicting opinions (when not inflamed with controversial hates), he would have wished a broader and more Catholic bond of unity among Christians than the opinionative creeds of his day permitted. His chief works are his *Confessio Remonstrantium* (1621); *Apologia pro Confessione* (1629); and *Institutiones Theologicæ*, incomplete. A complete edition of his works appeared at Amsterdam in 2 vols., 1650.

EPIS'TATES, the title of the presiding officers of the great councils of the Athenians, the Ecclesia and the council of Five Hundred. The E. held office for only one day at a time.

EPISTLE. The lesson in the church service called the E., derives its name from being most frequently taken from the apostolic epistles, although it is sometimes also taken from other parts of Scripture. This part of the service is believed to be as old as the 6th century.

EPISTLE SIDE OF THE ALTAR, the left side of the altar or communion table, looking from it, at which in the church service the epistle of the day is read. It is of lesser distinction than the right or gospel side, and is occupied by the clergyman of lower ecclesiastical rank. The reader of the epistle was in former times called the epistler.

EPISTLES, SPURIOUS, have been forged by various unknown authors, and for a variety of purposes. Many of them are lost, but a considerable number are extant, among which are the following: 1. *The Epistle of Paul to the Laodiceans.*—In the early

part of the 2d c. there was a Greek epistle with this title. It was received by the heretic Marcion, but is generally believed to have been a forgery founded on Paul's direction to the Colossians to read the epistle from Laodicea. "Some," said Theodoret in the 5th c., "imagine Paul to have written to the Laodiceans, and accordingly produce a certain forged epistle; but the apostle does not say *to*, but *from*, the Laodiceans." There is also an epistle with this title now extant in Latin, which, however, cannot be proved to be a translation of the former, but has, probably, a comparatively modern origin. It was first published in 1517, but existed in manuscript, at an earlier date, in the library of the Sorbonne. 2. *The Third Epistle of Paul to the Corinthians.*—Many persons have inferred from several passages in the two genuine epistles that Paul wrote a third which is not in the canon. There is still extant in the Armenian language an epistle professedly from the Corinthians to the apostle, with his reply. It was quoted in the 3d c. by Gregory, the illuminator, first bishop of Armenia, but has not been noticed by any ancient Greek or Latin writer. 3. *The Epistle of Peter to James* was forged in very early times, and is supposed to have been used as an introduction to the *Preaching of Peter*, which was held in great esteem by some early Christian writers, and was considered a genuine work by Clement of Alexandria (about the end of the 2d c.), Theodotus of Byzantium, and others. It was used by the heretic Heracleon in the 2d century. Origen (first half of 3d c.) did not receive it as the work either of Peter or of any other inspired person. Its author, perhaps, was one of the Ebionites at the opening of the 2d century. 4. *The Epistles of Paul and Seneca* comprise eight long letters in Latin from the philosopher Seneca to the apostle Paul, and six from Paul to Seneca in reply. They are certainly ancient. Jerome (about the end of the 4th c.), supposing them genuine, valued them highly, and was led by them to place Seneca in his catalogue of saints. At that time they were read by many. Augustine (about the same time) also speaks of them as genuine. Some learned men of more modern times accept them, but by far the greater number pronounce them spurious. 5. *The Epistle of Publius Lentulus*, written from Jerusalem to the Roman senate. It contains (but with many variations of the text) the following oft-quoted description of the personal appearance of Christ: "A man of tall stature, good appearance, and a venerable countenance, such as to inspire beholders with both love and awe. His hair, worn in a circular form and curled, rather dark and shining, flowing over the shoulders, and parted in the middle of the head, after the style of the Nazarenes. His forehead smooth and perfectly serene, with a face free from wrinkle or spot, and beautified with a moderate ruddiness, and a faultless nose and mouth. His beard full, of an auburn color, like his hair, not long but parted. His eyes quick and clear. His aspect terrible in rebuke, placid and amiable in admonition, cheerful, without losing its gravity: a person never seen to laugh, but often to weep." Dr. Edward Robinson, after a careful examination of the whole subject, comes to the following judgment: "*In favor* of the authenticity of the letter we have only the purport of the inscription. There is no external evidence whatever. *Against* its authenticity we have the great discrepancies and contradictions of the inscription; the fact that no such official person as Lentulus existed at the time specified, nor for many years before and after; the utter silence of history in respect to the existence of such a letter; the foreign and later idioms of its style; the contradiction in which the contents of the epistle stand with established historical facts; and the probability of its having been produced at some time not earlier than the 11th century." 6. *An Epistle of the Virgin Mary*, said to have been written in Hebrew, but extant in Latin, addressed to the Christians of Messina, and giving name to the metropolitan church of "Our Lady of the Letter." 7. *An Epistle of the Virgin* to the Florentines. 8. *From the same* to Ignatius, with his reply. Numerous other spurious epistles need not be noticed here.

EPISTOLÆ OBSCURORUM VIRORUM (Lat. Letters of Obscure Men) is the title of a collection of satirical letters which appeared at the commencement of the 16th c., and professed to be the composition of certain ecclesiastics and professors in Cologne and other places in Rhenish Germany. They were directed against the scholastics and monks, and lashed with merciless severity their doctrines, writings, morals, modes of speech, manner of life, follies and extravagances, and thus helped in no small degree to bring about the reformation. The controversy of Reuchlin with the baptized Jew, Pfefferkorn, concerning Hebrew punctuation, gave the first occasion to the *Epistolæ*, and it is probable that their title itself was suggested by the *Epistolæ Clarorum Virorum ad Reuchlinum Phorcensum* (1514). They were addressed to Ortuin Gratius in Deventer, who was by no means so complete an ignoramus as might be supposed from this circumstance, but who had made himself odious to the liberal minds of the time by his arrogant pretension and his determined hostility to the spirit of his age. On the first appearance of the work, it was fathered on Reuchlin; afterwards, it was ascribed to Reuchlin, Erasmus, and Hutten. More recent investigators have inclined to the belief, that the *first* part, which appeared at Hagenau in 1515 (but professedly at Venice), was the production of Wolfgang Angst, a learned and witty book-printer of that town; but, latterly, doubt has also been expressed whether even he had anything to do with the *Epistolæ*. In the composition of the second part (published in 1519), after Ulrich von Hutten, Erotus Rubeanus had the most considerable share. The circumstance of the *Epistolæ* being placed in the catalogue of forbidden books by a papal bull, helped to spread it not a

little. Among the numerous editions of the work (1643, 1703, 1827, etc.), the best is that by Böcking (1858; 2d ed. 1864). See D. F. Strauss's *Ulrich von Hutten.*

EP'ITAPH (Gr. *epi*, upon, and *taphos*, a hillock, mound, or other monument placed over a grave). From originally signifying a monument, this word is now used exclusively to designate the inscription commemorative of the deceased which is placed upon the monument. This perversion may in some measure have arisen from the remembrance of the funeral orations which the ancients were in the habit of pronouncing at funerals. But the E., in its stricter sense, was well known to the classical nations of antiquity; and, indeed, by every people a brief commemoration of the heroic actions or personal virtues of their illustrious dead has been regarded as one of the worthiest occupations of the faculties of the living. As epitaphs were not only engraved on the most enduring substances, but from their brevity were easily preserved in the memory and orally transmitted, wherever we find the literature of a people at all we are pretty sure to discover specimens of their epitaphs. Pettigrew has translated several from Egyptian sarcophagi (Bohn's edition, p. 5), but they are of no great interest. Herodotus (vii. 228) has preserved to us those which the Amphictyons caused to be inscribed on the columns which they raised in honor of the heroes of Thermopylæ, and that which Simonides, from personal friendship, placed on the tomb of the prophet Megistias. The general inscription for the whole of them was to this effect: "Four thousand from Peloponnesus once fought on this spot with three hundred myriads;" and that which was special to the Spartans was still more memorable: "Stranger, go tell the Lacedemonians that we lie here obedient to their commands." The *Anthologia Græca*, edited by Brunk, and subsequently by Jacobs, contains the largest collection of Greek epitaphs: of these many were translated and published by Bohn in 1854, under the editorial care of Mr. George Burges. Of Roman epitaphs, every antiquarian museum even in this country presents numerous examples; for the form in which they were conceived was adopted by our own Romanized forefathers, and many a stone bearing the well-known *D. M.* (*Diis Manibus*), or *Siste Viator*, probably covered the remains of those whose veins never contained a drop of Roman blood. A very interesting collection of early Christian epitaphs will be found in Dr. Charles Maitland's *Church in the Catacombs*, published in 1846. The naturally epigrammatic turn of the French mind peculiarly adapts it for this species of composition, and in French collections, such as the *Recueil d'Epitaphes*, very felicitous examples are to be found both in Latin and in French. Of the former may be mentioned the "Tandem felix!" which the count de Tenia, who had enjoyed every form of temporal prosperity, caused to be engraved on his tomb; and of the latter, the touching E. to a mother, "La première au rendez-vous." A large portion of the earlier monuments, and consequently of the epitaphs of this country, were destroyed at the reformation, and subsequently by the inconoclastic rage of the Puritans and Presbyterians. But when we come down to a later date, the literature of no people, either ancient or modern, can vie with our own in this peculiar branch, for whilst English epitaphs possess the point and terseness without which no E. can be successful, they exhibit a feature almost unknown in those of other nations—that, viz., of wit, or more properly speaking, perhaps, of humor. It seems as if the wittiest people in the world, as the English unquestionably are, had found it impossible to confine their raillery to the living, and accordingly we find that the harmless peculiarities of the dead have often been hit off on a tombstone, with a felicity which has rendered immortal what otherwise the next generation must have forgotten. Of this class of epitaphs our collections present an almost infinite variety. There are many excellent old collections of epitaphs, such as the *Thesaurus Epitaphiorum* of Philip Labbe, Paris, 1666. Of modern ones, the best is that of Pettigrew, published by Bohn, which is so arranged as to mark the diversity of taste prevailing at different periods of our history. See also the works of Gruter, Græsius, Reinesius, Muratori, Mazochius; the *Monumenta Anglicana*, London, 1719; Weaver's *Ancient Funeral Monuments*, etc.

EPITHALA'MIUM was a species of poem which it was the custom among the Greeks and Romans to sing in chorus near the bridal-chamber (*thalamus*) of a newly-married couple. Anacreon, Stesichorus, and Pindar composed poems of this kind, but only scanty fragments have been preserved. The epithalamium of Peleus and Thetis by Catullus is one of the finest specimens of Latin poetry extant; but probably the most gorgeous epithalamium in all literature, is that of the English poet Spenser. A collection of Greek and Latin epithalamia is to be found in Wernsdorf's *Poetæ Latini Minores* (4th vol., part 2).

EPITHELIO'MA, a variety of cancer, attacking surfaces covered with epithelium or epidermis. See CANCER.

EPITHE'LIUM is the term applied in anatomy to the cell-tissues which, in layers of various thickness, invests not only the outer surface of the body, and the mucous membranes connected with it—as, for example, those of the nose, lungs, intestinal canal, etc.—but also the closed cavities of the body, such as the great serous membranes, the ventricles of the brain, the synovial membranes of joints, the interior of the heart and of the blood-vessels proceeding to and from it, the ducts of glands, etc.

The thickness of this tissue varies extremely with the position in which it occurs. In some parts it consists of numerous strata of cells, collectively forming a layer of more

than a line in thickness; in other parts, it is composed of only a few strata, or often of only a single stratum of cells, and can only be detected by the microscope.

The cells of which the E. is composed are usually soft nucleated cells; they may be rounded, polygonal, fusiform, cylindrical, or conical in shape, and sometimes they possess vibratile cilia, the appearance and uses of which will presently be explained.

In his *Manual of Human Histology*, Kölliker adopts the following arrangement. He considers (*a*) E. in a single stratum, and (*b*) E. in many layers.

(*a*) *Epithelium in a single stratum* may be composed of:

1. *Rounded, polygonal cells*, constituting the variety known as pavement or tessellated E., and occurring as an investment of the serous membranes of most synovial membranes, of the lining membrane of the heart and of the veins, of the canals of glands, etc.

2. *Fusiform, superficially united cells* (fusiform E.), as the E. of the arteries and of many veins.

3. *Cylindrical cells* (cylinder E.), as in the intestine from the stomach to the termination of the alimentary canal, in the excretory ducts of all the glands opening into the intestine, etc. Various illustrations of this cylinder E. are given in the article DIGESTION, ORGANS AND PROCESS OF.

4. *Cylindrical or conical ciliated cells*, as the E. of the more minute bronchial tubes, of the nasal cavities, and of the uterus.

5. *Rounded ciliated cells*, as the ciliated pavement E. of the ventricles of the brain in the fetus.

(*b*) *Epithelium in many layers* may be composed of:

1. *Cylindrical or rounded cells below, and more or less flattened cells above.* This is termed laminated pavement E., and occurs in the mouth, lower part of pharynx, esophagus, bladder, etc.

2. *Rounded cells below, more elongated ones in the middle, and ciliated conical ones above.* This is termed laminated ciliary E., and occurs in the larynx, trachea, and larger bronchial tubes, in the greater part of the nasal cavity, etc.

In all the varieties of E., the layer of external cells is being constantly disintegrated and replaced by the layer immediately beneath.

The uses of the chief varieties of E., especially of ciliated E., require some notice.

The polygonal or pavement E. mainly acts like the epidermis, as a protecting medium to the soft parts beneath.

The cylindrical E. additionally takes an active part in the process of secretion. Illustrations of the function of the cells forming this variety of E. are given in the articles CELLS, ANIMAL: DIGESTION, ORGANS AND PROCESS OF; and the subject will be further noticed under the head SECRETION.

In connection with ciliated E., we must notice *ciliary motion* generally, in so far as it occurs in the animal kingdom. Certain surfaces which are lubricated by a fluid, are covered with a multitude of hair-like processes of extreme delicacy and minuteness (their length varying from $\frac{1}{1000}$ to $\frac{1}{2000}$ of an inch), which from their shape are termed *cilia*, from *cilium*, an eyelash. During life, and for a certain period after death, these filaments exhibit a remarkable movement, each cilium bending rapidly in one direction, and rapidly returning to its original position (according to Krause, these movements range from 190 to 230 in a minute). On examining a ciliated surface with a high magnifying power, the motion presents an appearance somewhat resembling that of a cornfield agitated by a steady breeze. Any minute objects coming in contact with the free extremities of the cilia are urged onward in the direction of the predominant movement: and the best method of observing the course of the ciliary current is to sprinkle the surface with a little powdered charcoal, grains of which may speedily be seen to move onwards in a definite direction.

An easy way to observe this phenomenon is to detach, by scraping with a knife, a small piece of E. from the back of the throat of a living frog. The scales, moistened with water or serum, will continue to exhibit the movement of their adherent cilia for a very considerable time, provided the piece be kept duly moistened. On one occasion, a piece prepared in this way by Mr. Bowman and Dr. Todd exhibited motion for 17 hours; and it would probably have continued doing so for a longer time, had not the moisture around it evaporated; and if the E. is not removed from the body of an animal that had been killed, the motion continues much longer. In a turtle, after death by decapitation, it lasted, in the mouth, 9 days; in the trachea and lungs, 13 days; and in the esophagus, 16 days. In man and mammals, it seldom lasts 2 days, and usually ceases much sooner. The necessary condition for their movement appears to be the integrity of the cells to which they are attached; for as soon as these shrink up for want of moisture, or undergo any physical change, the cilia cease their characteristic action. We know nothing with certainty regarding the mechanism or source of ciliary motion, except that (as it continues on detached E.) it is independent of both the vascular and nervous systems.

This phenomenon exists very widely throughout the animal kingdom. Dr. Sharpey, in his article CILIA* (published upwards of 40 years ago), notices its occurrence in the

* In the *Cyclopædia of Anatomy and Physiology.*

infusoria, in polyps and their ova, in acalephæ, actiniæ, echinodermata, annelida, mollusca, and the molluscoids (e.g., ascidians), in reptiles, birds, and mammals. Since the date of that article, it has been discovered in sponges, and in one or two exceptional cases in fishes; but it has never been found in any part of the body of articulata (crustaceans, insects, or arachnidans). The parts on which it occurs are (1) the skin or surface of the body, (2) the respiratory, (3) the alimentary, and (4) the genito-urinary systems; and it has been observed in the ova of numerous classes of animals, from reptiles downwards to infusoria. In most of the parts in which we observe it, its use appears to be of a mechanical nature—viz., to convey the fluids or other matters along the surfaces on which the cilia exist, or, as in the infusoria, to carry the entire animal through the water.

1. Cilia have been found on the external surface in batrachian larvæ, in mollusca, annelida, echinodermata, actiniæ, medusæ, polypi, and infusoria. In most cases, their function is respiratory, but in many instances it is also locomotive or prehensile.

2. Ciliary motion has been observed on the lining membrane of the air-passages of mammals, birds, and reptiles, where, whatever may be its other uses, it serves to convey the secretions along the membranes, together with any foreign matters that may be present. It exists also on the external gills of batrachian larvæ, and on the respiratory organs of mollusca and annelida. The cilia which exist externally on still lower animals without separate respiratory organs, assist in the respiratory process, by renewing the water on the surface.

3. It occurs in the mouth, throat, and gullet of various reptiles, and the alimentary canal of the mollusca, echinodermata, many annelida, and acalephæ. It is not easy, as Dr. Sharpey observes, to see the purpose of the motion in all these cases. In some, it may merely convey secreted matters along the surface of the lining membrane; and in others it seems to serve in place of ordinary deglutition, to carry food into the stomach.

4. It is observed on the surface of the reproductive organs of mammals, birds, and reptiles. From the direction of the current being from without inwards, the office of the cilia may be to hurry down the ovum, in addition to removing the mucous secretion of the membrane.

In reptiles and fishes, ciliary motion exists at the neck of each uriniferous tube. The movement is directed towards the tube, and favors the flow of the watery portion of the secretion towards it.

There are some situations, both in man and the lower animals, in which it is difficult to determine what functions the ciliary motion can perform, as, for example, in man, in the ventricles of the brain; and in the frog, in the closed cavities of the pericardium and peritoneum.

EPIZO'A. This term is applied to those parasitic creatures which live on the bodies of other animals, and derive their nourishment from the skin. Our space will only allow of our noticing those that infest man. They may be divided into two groups: (1) Those which live upon the surface of the skin, and (2) those which live in the skin. Fleas, lice, bugs, ticks, etc., belong to the first group; the itch-insect or *sarcoptes*, the pimple-mite or *demodex folliculorum*, and possibly some other species of the *acaridæ*, to the second.

In a zoological point of view, all the E. that infest the human subject are insects or arachnidans. The parasitic insects are: I. *Pulicida*, or *fleas*, including—1. The common flea, or *pulex irritans;* 2. The sand-flea, or *pulex penetrans*, known also as the chigo, chigger, etc. II. *Acanthida*, or *soft bugs*, including the common bed-bug or *acanthia* (s. *cimex*) *lectularia*. III. *Pediculida*, or *lice*, including—1. The common louse, or *pediculus capitis;* 2. The body louse, or *pediculus vestimenti;* 3. The crab louse, or *pediculus* (s. *phthirius*) *pubis;* 4. The louse occurring in phthiriasis, or *pediculus tabescentium*.

The parasitic arachnidans belong to the order of *acarida*, or mites; indeed, most of the animals forming the different families of this order lead a parasitic existence. We have—I. *Demodicida*, including the pimple-mite or *demodex* (s. *acarus*) *folliculorum* (the dog and the sheep possess each a special demodex. II. *Sarcoptida*, including the itch-mite or *sarcoptes* (s. *acarus*) *scabiei*. (Most of our domestic animals seem to be infested by a special sarcoptes, the species of which are numerous.) III. *Ixodida* or ticks, including—1. The American tick or *ixodes hominis* (common in Brazil); 2. The common wood-tick (dogs' tick), or *ixodes ricinus*. There are probably many species of ixodes which are occasionally found on man. IV. *Gamasida*, or beetle lice, including—1. The bird-mite, or *dermanyssus avium* (occasionally found on sickly persons); 2. The Miana bug, or *argas persicus* (common in some parts of Persia, and especially at Miana); 3. The chincha bug, or *argas chinche* (occurring in Columbia). V. *Orobatida*, or grass-lice, including the harvest-bug, or *leptus autumnalis*. See the articles BUG, FLEA, ITCH-MITE, LOUSE, TICKS.

EPIZÖOTICS (Gr. *epi*, upon, and *zöon*, an animal) are diseases of animals which manifest a common character, and prevail at the same time over considerable tracts of country. Like epidemics, they appear to depend upon some peculiar and not well ascertained atmospheric causes; where the cases are neglected or overcrowded, they also frequently become contagious; they are apt to take on a low type of fever, and

are better treated by supporting than by reducing remedies. Influenza in horses, and pleuro-pneumonia and vesicular epizootic in cattle, are examples.

EPOCH, in astronomy, is an abbreviation for "longitude at the E.;" it means the mean heliocentric longitude of a planet in its orbit at any given time—the beginning of a century, for instance. The E. of a planet for a particular year is its mean ongitude at mean noon, on Jan. 1, when it is leap year, and on Dec. 31 of the preceding year, when it is a common year. The E. is one of the elements of a planet's orbit.

EP'OCH, in chronology. See CHRONOLOGY.

EP'ODE is the last part of the chorus of the ancient Greeks, which they sung after the strophe and antistrophe, when the singers had returned to their original place. The E. had its peculiar measure of syllables and number of verses. See CHORUS.

EPP'ING, a t. in the w. of Essex co., England, in a pleasant healthy situation, at the n. end of E. forest, 16 m. n.n.e. of London. It has a very irregular appearance. Pop. '71, 2,275. It is noted for its cream, butter, sausages, and pork. It sends large quantities of butter to London. E. royal forest, formerly under the name of Waltham forest, where our ancient kings enjoyed much sport, covered all Essex, and extended almost to London. It is now limited to 60,000 acres in the s.w. part of the county. Of this tract, only 12,000 acres are in wastes and woods, the rest being now inclosed as private property. In the forest, 5 m. from E., is queen Elizabeth's hunting-lodge. Separated by the river Roding from E. forest is Hainault forest, lately disforested. Here for many centuries a fair was held under the enormous Fairlop oak, not now existing, and a stag was yearly turned out in the forest on Easter Monday, for the amusement of the public. To this day, a stag is turned out yearly for the amusement of Cockney huntsmen.

EPROUVETTE is a machine for proving or testing the strength of gunpowder. It was invented or suggested in the last century by Robins, but was greatly improved by Dr. Hutton.

The *gun* E. determines the strength of gunpowder by the amount of recoil produced. A small gun, usually a "half-pounder," is fixed to the lower end of an iron rod; its base being adjusted to an arm projecting from the rod; or else it is suspended from an iron frame. A horizontal steel axis is fixed to the rod or frame about which the gun may vibrate. A pointed iron rod or style projects downwards from the lower side of the gun, and touches a groove filled with soft wax; the groove is so shaped that, when the gun recoils, the point cuts a path for itself along this wax; and the length of this path determines the amount of recoil. Sometimes a brass graduated arc with an index is used instead of the pointed style and the waxed groove; but the principle of action is just the same. On the arc the recoil should vary from 26° for new fine-grain powder to 20° 5′ for old powder of coarse grain. This system of proof is resorted to annually at minor and foreign stations for the proof of all powder in store, to ascertain the amount of deterioration; five rounds constitute the minimum proof. Before the E. is resorted to, the powder must pass the test of specific gravity, by weighing not less than 55 lbs. to the cubic foot.

The *mortar* E. determines the strength of gunpowder by the distance to which a ball is projected, instead of the distance to which the piece recoils. It is generally a mortar of 8-inch bore, in which 2 to 4 ozs. of powder is employed to propel an accurately turned iron shot to a distance of about 120 yards. Other things being equal, the strongest gunpowder sends the shot to the greatest distance; and this is the usual mode adopted in testing gunpowder supplied to the government by various contractors.

The ordinary E. is an instrument shaped like a small pistol without a barrel, and having its breach chamber closed by a flat plate connected with a strong spring. On the explosion of the powder against the plate, it is driven back to a distance indexed according to the strength of the powder, and is retained at its extreme state of propulsion by a ratchet wheel.

EPSOM (said to have originally been Ebbasham) is a small market t. on the margin of the Banstead downs in Surrey, 15 m. s.s.w. of London by road, and 14 m. by the London and Southwestern railway. The famed sulphate of magnesia springs of E. gave their name to the E. salts formerly manufactured from them. This manufacture has been abandoned from the ease with which these salts can be made artificially. The royal medical college, erected on the Downs, and established in 1851, provides education for about 170 boys, the sons of medical men, and affords a home to decayed members of the profession and their widows. Pop. '71, 6,276. On the Downs, 1½ m. s. of the town, the famous E. horse-races are held yearly. They are said to have been instituted by Charles I., but have become of greater importance since the institution of the Derby stakes in 1780 (see DERBY DAY). The races last four days, and as many as 100,000 persons often assemble to witness the most important of them.

EPSOM SALT, or SULPHATE OF MAGNESIA ($MgO+SO_3HO$), occurs not only in the water of mineral springs, as at Epsom, Seidlitz, and many other places; but also as an efflorescence on the surface of various rocks, sometimes along with alum, as at Hurlet, in Renfrewshire; and on the ground, as in some parts of Spain and of the Russian

steppes. It sometimes occurs snow-white and very pure, sometimes discolored by impurities; and is either in the form of fine thread-like crystals, or in crusts, flakes, granules, etc. Its crystals are prisms, almost rectangular. For purposes of commerce, it is obtained by the action of dilute sulphuric acid upon magnesian limestone. See MAGNESIUM.

E. S. is a well-known purgative remedy much in use in household medicine. It may be given in doses from 2 drams to 1 oz., according to the effect required, in a tumbler of water. The disagreeable bitter taste is much relieved by acidulating with nearly a teaspoonful of dilute sulphuric acid to each ounce of salt.

EPWORTH, a t. in the n.w. of Lincolnshire, England, 30 m. n.n.w. of Lincoln. It chiefly consists of one street, above 2 m. long. The chief employments are hemp and flax dressing, rope-making, and malting. Pop. '71, 2,295. John Wesley, founder of Methodism, as well as Kilham, founder of the seceding Wesleyans, was born here.

EQUABLE MOTION is that by which equal spaces are passed over in equal times.

EQUALITY. See LIBERTY, EQUALITY, FRATERNITY.

EQUATION, ANNUAL, one of the most conspicuous of the subordinate fluctuations in the moon's motion, due to the action of the sun, which increases with its proximity to the earth and her satellite. It consists in an alternate increase and decrease in her longitude, corresponding with the earth's situation in its annual orbit, i.e., to its angular distance from the perihelion, and therefore having a year instead of a month, or aliquot part of a month, for its period. For an explanation of the mode of its production, the reader is referred to Herschel's *Outlines of Astronomy*, art. 738, *et seq.* The subject is too abstruse for explanation in this work.

EQUATION, DIFFERENTIAL, is an equation involving differential co-efficients (see CALCULUS); such is $\frac{d^2y}{dx^2} + a\frac{dy}{dx} = x$; from which it is required to find the relation between y and x. The theory of the solution of such equations is an extension of the integral calculus, and is a branch of study of the highest importance.

EQUATION, FUNCTIONAL. See FUNCTIONS.

EQUATION, LUNAR. See LUNAR THEORY.

EQUATION OF THE CENTER. If the earth moved uniformly round the sun in a circle, it would be easy to calculate its longitude or distance from the line of equinoxes at any time. One year would be to the time since the vernal equinox as 360° to the arc of longitude passed over. But the orbit of the earth is not circular, nor is its motion uniform; the orbit is slightly elliptical, and the motion is quicker at perihelion than at aphelion. The true rule, then, for ascertaining the earth's longitude is contained in the following proportion: one year is to the time elapsed as the whole area of the earth's orbit is to the area swept over by the radius vector in the time. This is a deduction from Kepler's law (see CENTRAL FORCES), that, in planetary motion, equal areas (not *angles*) are swept over in equal times. The area swept over being ascertained from the laws of the earth's motion, and the elements of its orbit, it is a question of geometry to ascertain the *angle* corresponding to the area, or the true longitude. In astronomy, the longitude, as calculated on the supposition that the earth moves uniformly in a circle, is called the *mean* longitude of the earth; and it happens, from the orbit being, as we said, but slightly different from a circle, that the mean and true longitude differ but slightly. The quantity by which the true and mean longitudes differ is called the *equation of the center;* and this is sometimes to be added to, and sometimes to be subtracted from the mean longitude, to obtain the true; and sometimes it is zero.

EQUATION OF EQUINOXES is the difference between the true position of the equinoxes, and the position calculated on the supposition that their motion is uniform. See PRECESSION.

EQUATION OF LIGHT. In astronomical observations, the visual ray by which we see any body is not that which it emits at the moment we look at it, but which it *did* emit some time before, viz., the time occupied by light in traversing the interval which separates it from us. If, then, the body be in motion, its aberration, as due to the earth's velocity, must be applied as a correction, not to the line joining the earth's place at the moment of observation with that occupied by the body, (as seen) at the same moment, but at that antecedent moment when the ray quitted it. Hence is derived a rule applied by astronomers for the rectification of observations made on a moving body, viz., from the known laws of its motion and the earth's, calculate its relative angular motion in the time taken by light to pass from it to the earth. This motion is the total amount of its apparent displacement. Its effect is to displace the body in a direction contrary to its apparent motion, an effort one part of which is due to aberration, properly so-called (see ABERRATION) resulting from the composition of the motions of the earth and of light, and another part to the fact of the passage of light occupying time. The *equation of light* is the allowance to be made for the *time* occupied by the light in traversing a variable space.

EQUATION OF PAYMENTS. The problem considered under this head in books of arithmetic is to find a time when, if a sum of money be paid by a debtor, which is equal to the sum of several debts payable by him at different times, no loss will be sustained by either the debtor or creditor. The rule generally given is as follows: Multiply each sum due by the time at which it is payable, and then divide the sum of the products by the sum of the debts: the quotient is the equated time. For example, if £10 be due at one month, and £20 at two months, find as an equivalent when the whole £30 may be paid at once. Ans. $\frac{10\times1+20\times2}{30} = 1\frac{2}{3}$ months. This rule is, however, incorrect where the debts are unequal, because it takes no account of the balance of interest and discount. A correct rule for the case of two debts and simple interest is subjoined. Let d and D denote the debts, t and T the times of payment, and r one year's interest on D. Then if $A = T + t + \frac{D+d}{dr}$, and $B = Tt + \frac{DT+dt}{dr}$, the equated time will $= \frac{1}{2}A - \frac{1}{2}\sqrt{(A^2 - 4B)}$. When three or more debts are concerned, the plan is to find by this formula the equated time for the first two, and then for their sum payable at their equated time, and the third, and so on. The common rule is, however, sufficiently correct for ordinary use.

EQUATION, PERSONAL, a correction important chiefly in astronomical observations. Two observers, each of admitted skill, often differ in their record of the same event—as the passage of a star before the wires of a transit instrument—by a quantity nearly the same for all observations by those persons. This quantity is their relative personal equation. Each observer habitually notes the time earlier or later than the fact, by a minute and nearly uniform portion of a second. This quantity is his absolute personal equation. The correction is of no value when comparison is made between the records of the same observer, since each is in error in the same way, but it becomes important when the work of different observers is combined. The value and sign of the personal equation is found for each observer by the discussion of a large series of observations. It is a reliable correction for the work of only trained observers, who have, by long practice, acquired a habitual method of work which is uniform, even their errors conforming to a system.

EQUATIONS. An equation may be defined to be an algebraical sentence stating the equality of two algebraical expressions, or of an algebraical expression to zero. From another point of view, it is the algebraical expression of the conditions which connect known and unknown quantities. Thus (1), $xy = 24$, and (2), $x^2 + y^2 = 52$, are two E. expressing the relations between the unknown quantities x and y and known quantities. Generally, E. are formed from observations from which an object of inquiry may be inferred, but which do not directly touch the object. Thus, suppose we wish to ascertain the lengths of the sides of a rectangular board which we have no means of measuring, and that all the information we can get respecting it is, that it covers (say) 24 sq. ft., and that the square on its diagonal is (say) 52 sq. feet. From these facts, we can form E. from which we may determine the lengths of the sides. In the first place, we know that its area is equal to the product of its sides, and if we call these x and y, we have $xy = 24$, the first of the E. above given. Again, we know that the sum of the squares on the sides is equal to the square on the diagonal; hence, we have the second equation, $x^2 + y^2 = 52$. From these two E., we should be able to determine the values of x and y. The determination of these values is called the *solution* of the equations.

E. are of several kinds. Simple E. are those which contain the unknown quantity in the first degree; thus, $\frac{x}{2} + 3 = 4$, is a simple equation. Quadratic E. are those which contain the unknown quantity in the second degree: $x^2 + 5x - 36 = 0$, is a quadratic equation. Cubic and biquadradic E. involve the unknown quantity in the third and fourth powers respectively. For the higher E., there are no special names; they are said to be E. of the degree indicated by the highest power of the unknown which they contain. Simultaneous E. are those which involve two or more unknown quantities, and there must always be as many of them, in order to their determinate solution, as there are unknown quantities. The E. first mentioned—viz., $xy = 24 - x^2 + y^2 = 52$, are simultaneous equations. It may be mentioned, that in the course of solving such E., the principal difficulties encountered are always ultimately the same as in the solution of E. containing only one unknown quantity. For instance, in the E. just given, if we substitute in the second the value of y as given by the first, or $y = \frac{24}{x}$, we have $x^2 + \frac{(24)^2}{x^2} = 52$, which may be solved as a quadratic equation. The general theory of E., then, is principally concerned with the solution of E. involving one unknown quantity only, for to this sort all others reduce themselves. Indeterminate E. are such as do not set forth sufficient relations between the unknown quantities for their absolute determination, and which accordingly admit of various solutions. Thus, $xy = 24$ is an indeterminate equation, which is satisfied by the values $x = 3$, $y = 8$; or

$x = 6$, $y = 4$; or $x = 2$, $y = 12$. We require some other relation, such as $x^2 + y^2 = 52$, to enable us to fix on one of the sets of values, x and y, as those of x. For other kinds of E., see EXPONENT AND EXPONENTIAL, FUNCTIONS, and DIFFERENCE.

The object of all computation is the determination of numerical values for unknown quantities, by means of the relations which they bear to other quantities already known. The solution of E., accordingly, or, in other words, the evolution of the unknown quantities in them, is the chief business of algebra. But so difficult is this business, that, except in the simple cases where the unknown quantity rises to no higher than the second degree, all the resources of algebra are as yet inadequate to effect the solution of E. in general and definite terms. For E. of the second degree, or quadratic E., as they are called, there is a rigorous method of solution by a general formula; but as yet no such formula has been discovered for E. even of the third degree. It is true, that for E. of the third and fourth degrees general methods exist, which furnish formulas which express under a finite form the values of the roots. See CARDAN and CUBIC EQUATIONS. But all such formulas are found to involve *imaginary* expressions, which, except in particular cases, make the actual computations impracticable till the formulas are developed in infinite series, and the imaginary terms disappear by mutually destroying one another. What is called Cardan's formula, for instance (and all others are reducible to it), is in this predicament whenever the values of the unknown quantity are all real; and accordingly, in nearly all such cases, the values are not obtainable from the formulæ directly, but from the infinite series of which they are the compact expression. But though such formulæ as Cardan's are useless for the purpose of numerical computation, the search for them has led to most of the truths which constitute the general theory of E., and through which their *numerical solution* may be said to have been at last rendered effective and general. This method of numerical solution is a purely arithmetical process, performed upon the *numerical co-efficients* of E., and it is universally applicable, whatever the degree of the equation may be. With this method are connected the names of Budan, Fourier, Horner, and Sturm. We cannot here enter into an account of it; the reader should consult on the subject Young's *Theory and Solution of Algebraical Equations of the Higher Orders;* Peacock's *Treatise on Algebra;* and La Grange's work on *Numerical Solutions.*

The rules for the solution of the simpler forms of E. are to be found in all elementary text-books of algebra. It must suffice to notice here a few of the leading general properties of equations. By the roots of an equation are meant those values real or imaginary of the unknown which satisfy the equality; and it is a property of every equation to have as many roots and no more as there are units in its degree. Thus, a quadratic equation has two roots; a cubic equation, three; and a biquadratic, four. The quadratic equation $x^2 + 5x - 36 = 0$ has two roots, $+ 9$ and $- 4$, which will be found to satisfy it. Further, the expression $x^2 + 5x - 36 = (x - 9)(x + 4) = 0$; and generally if the roots of an equation

$$F(x) = x^n \pm A_{n-1}x^{n-1} \pm A_{n-2}x^{n-2} \pm \ldots \pm A_1 x \pm A_0 = 0$$

(to which general form every equation of the nth degree can be reduced), are

then
$$\begin{gathered} \pm a_1 \pm a_2 \pm a_3 \ldots \pm a_n \ldots \\ (x \mp a_1)(x \mp a_2)(x \mp a_3) \quad \ldots \\ (x \mp a_n) = F(x) = 0. \end{gathered}$$

Hence, and from observing the way in which, in the multiplication of these factors, the co-efficients

$$A_{n-1},\ A_{n-2} \ldots A_1,\ A^0$$

are formed, we arrive at the following important results:

A_{n-1} = the sum of the roots, with their signs changed.
A_{n-2} = the sum of the products of every two roots, with their signs changed.
A_{n-3} = the sum of the products of every three roots, with their signs changed.
A_0 = the product of the roots, with their signs changed.

The factors, it will be observed, are formed thus: If $+ a_1$ be a root, then $x = a_1$, and $x - a_1 = 0$ is the factor. If the root were $- a_1$, then $x = - a_1$; and the factor would be $x + a_1 = 0$. Observing now the way in which, in multiplying a series of such factors, the co-efficients of the resulting polynominal are formed, we arrive at this: that a complete equation cannot have a greater number of positive roots than these *changes* of sign from $+$ to $-$ and from $-$ to $+$ in the series of terms forming its first member; and that it cannot have a greater number of negative roots than there are *permanencies* or repetitions of the same sign in proceeding from term to term. From the same source, many other general properties of E., of value in their arithmetical solution, may be inferred. The subject is, however, too vast to be more than glanced at here.

EQUATION OF TIME. It will be seen from the article EQUATION OF THE CENTER (q.v.) that the earth's motion in the ecliptic—or what is the same thing, the sun's apparent motion in longitude—is not uniform. This want of uniformity would of itself obviously cause an irregularity in the time of the sun's coming to the meridian on successive days; but besides this want of uniformity in the sun's apparent motion in the ecliptic, there is another cause of inequality in the time of its coming on the meridian—

viz., the obliquity of the ecliptic to the equinoctial. Even if the sun moved in the equinoctial, there would be an inequality in this respect, owing to its want of uniform motion; and even if it moved uniformly in the ecliptic, there would be such an inequality, owing to the obliquity of its orbit to the equinoctial. These two independent causes conjointly produce the inequality in the time of its appearance on the meridian, the correction for which is the equation of time.

When the sun's center comes to the meridian, it is apparent noon, and if it moved uniformly on the equinoctial, this would always coincide with *mean noon*, or 12 o'clock on a good solar clock. But from the causes above explained, mean and apparent noon differ, the latter taking place sometimes as much as 16¼ minutes before the former, and at others as much as 14¼ minutes after. The difference for any day, called, as we have said, the equation of time, is to be found inserted in ephemerides for every day of the year. It is nothing or zero at four different times in the year, at which the whole mean and unequal motions exactly agree—viz., about the 15th of April, the 15th of June, the 31st Aug., and the 24th December. At all other times, the sun is either too fast or too slow for clock-time. In the ephemerides above referred to, the sign + or − is prefixed to the equation of time, according as it is to be added to or subtracted from the apparent time to give the mean time. See NAUTICAL ALMANAC.

EQUA'TOR, CELESTIAL, is the great circle in the sky corresponding to the extension of the equator of the earth.

EQUATOR, TERRESTRIAL, the great circle on the earth's surface dividing the earth into the northern and southern hemispheres, and half way between the poles.

EQUATO'RIAL, an important astronomical instrument, by which a celestial body may be observed at any point of its diurnal course. It consists of a telescope attached to a graduated circle, called the declination circle, whose axis penetrates at right angles that of another graduated circle called the hour circle, and is wholly supported by it. The pierced axis, which is called the principal axis of the instrument, turns on fixed supports; it is pointed to the pole of the heavens, and the hour circle is of course parallel to the equinoctial. In this position, it is easy to see that a great circle of the heavens corresponding to the declination circle, passes through the pole, and is an hour circle of the heavens. The telescope is capable of being moved in the plane of the declination circle. If, now, the instrument be so adjusted that the index of the declination circle must point to zero when an equatorial star is in the center of the field of view of the telescope, and the index of the hour circle must point to zero when the telescope is in the meridian of the place, it is clear that when the telescope is directed to any star, the index of the declination circle will mark the declination of the star; and that on the other circle its right ascension. If the telescope be clamped when directed on a star, it is clear that, should the instrument be made to rotate on its principal axis with entire uniformity with the diurnal motion of the heavens, the star would always appear in the field of view. This motion of rotation is communicated to the instrument by clock-work.

EQUESTRIANISM. See HORSEMANSHIP.

EQUESTRIAN ORDER, or E'QUITES. This body originally formed the cavalry of the Roman army, and is said to have been instituted by Romulus, who selected from the three principal Roman tribes 300 equites. This number was afterwards gradually increased to 3,600, who were partly of patrician and partly of plebeian rank, and required to possess a certain amount of property. Each of these equites received a horse from the state; but about 403 B.C., a new body of equites began to make their appearance, who were obliged to furnish a horse at their own expense. These were probably wealthy *novi homines*, men of equestrian fortune, but not descended from the old equites (for it should be observed that the equestrian dignity was hereditary). Until 123 B.C., the equites were exclusively a military body; but in that year Caius Gracchus carried a measure, by which all the *judices* had to be selected from them. Now, for the first time, they became a distinct order or class in the state, and were called *ordo equestris*. In 70 B.C., Sulla deprived them of this privilege; but their power did not then decrease, as the forming of the public revenues appears to have fallen into their hands. After the conspiracy of Catiline, the E. O., which on that memorable occasion had vigorously supported the consul Cicero, began to be looked upon as a third estate in the republic; and to the title of *senatus populusque Romanus* was added *et equestris ordo*. But, even in the beginning of the empire, the honor, like many others, was so indiscriminately and profusely conferred, that it fell into contempt, and the body gradually became extinct. As early as the later wars of the republic, the equites had ceased to constitute the common soldiers of the Roman cavalry, and figure only as officers.

EQUESTRIAN STATUE, the representation of a man on horseback. Equestrian statues were awarded as a high honor to military commanders and persons of distinction in Rome, and latterly were, for the most part, restricted to the emperors, the most famous in existence being that of the emperor Marcus Aurelius, which now stands in the piazza of the capitol at Rome. It is the only ancient E. S. in bronze that has been preserved; an exemption which it probably owed to the fact, that for centuries it was supposed to

be a statue of Constantine. The action of the horse is so fine, and the air of motion so successfully given to it, that Michael Angelo is said to have called out to it "*Camminal*" —(Go on, then!). It was originally gilt, and traces of the gilding are still visible on the horse's head. So highly is this statue prized, not only for its artistic but its historical value, that an officer used regularly to be appointed by the Roman government to take care of it, under the designation of the *custode del cavallo*. On the occasion of the rejoicings by which Rienzi's elevation to the tribuneship was celebrated in 1347, wine was made to run out of one nostril and water out of the other of this famous horse. The statue then stood in front of the church of St. John Lateran, near to which it was found, and a bunch of flowers has always been presented annually to the chapter of that basilica, in acknowledgment of ownership, since it was removed to its present site on the capitol. All European capitals are adorned, or disfigured, by numerous equestrian statues, London belonging pre-eminently to the latter category.

EQUIANGULAR, having equal angles. A figure is said to be E. all whose angles are equal to one number, as a square, or any regular polygon. All triangles and other figures are said to be E. one with another whose corresponding angles are equal.

EQUIDÆ, or SOLIDUNGULA (Lat. solid-hoofed), a family of mammalia of the order *pachydermata*, containing only a small number of species, which so nearly resemble each other that almost all naturalists agree in referring them to one genus, *equus*. They are distinguished from all other quadrupeds by the complete consolidation of the bones of the toes, or the extraordinary development of one toe alone in each foot, with only one set of phalangeal and of metacarpal or metatarsal bones, and the extremity covered by a single undivided hoof. There are, however, two small protuberances (*splint bones*) on each side of the metacarpal or metatarsal bone (*canon* or *cannon bone*), which represent other toes. The E. have six incisors in each jaw, and six molars on each side in each jaw; the males have also two small canine teeth in the upper jaw, sometimes in both jaws, which are almost always wanting in the females. The molars of the E. have square crowns, and are marked by laminæ of enamel with ridges forming four crescents. There is a wide space between the canine teeth and the molars. The stomach of the E. is simple, but the intestines are long, and the cæcum extremely large; the digestive organs being thus very different from those of the ruminants, but exhibiting an equally perfect adaptation to the same kind of not easily assimilated food. Another distinctive peculiarity of the E. is, that the females have two teats situated on the pubes, between the thighs. But notwithstanding these characters, so dissimilar to those of the ruminants, they approach them very much in their general conformation, and may be regarded as a connecting link between pachyderms and ruminants. The largely developed and flexible upper lip is a character which belongs to the former rather than to the latter order.

The E. are now found in a truly wild state only in Asia and Africa. Fossil remains exist in the newer geological formations in great abundance in many parts of the old world; very sparingly, however, in the new, although the bones of a peculiar and distinct species (*equus curvidens*), belonging to the pleiocene period, have been found in South America.

The horse and the ass are by far the most important species of this family. The dziggethai has also been domesticated and made useful to man. Of the other species, the zebra, quagga, and dauw, it is generally believed that they are incapable of useful domestication.

EQUILATERAL, having equal sides. A square is equilateral. The equilateral hyperbola is that whose axes and conjugate diameters are equal.

EQUILIBRIUM, the state of rest or balance of a body or system, solid or fluid, acted upon by various forces. See STATICS and HYDROSTATICS.

EQUI'NIA, or GLANDERS. In another part of this work, glanders has been considered simply as a disease peculiar to animals, and especially the horse. We shall here consider it as a disease affecting man, to whom it is transmissible from animals. It is remarkable that although the disease in the horse and ass has been recognized from the time of Aristotle (who describes it as common in the ass), it was not till the year 1810 that Waldinger of Vienna drew attention to the fact, that special precautions should be taken in the dissection of horses affected with glanders and farcy, inasmuch as the most serious and often fatal consequences might arise from the inoculation of the morbid matter. Strangely enough, however, he does not seem to have noticed that the disease thus induced in man is identical with that of the horse; and it was not till 1821 that Schilling recognized this important point. It was not till a living physician, Dr. Elliotson, published his memoir, *On the Glanders in the Human Subject*, in 1830, that the attention of the medical profession in this country was directed to the subject. In 1837, Rayer, in his memoir *De la Morve et du Farcin chez l'Homme*, collected all the cases that had been observed up to that date, and gave a complete description of the various forms of glanders both in the horse and in man; and in 1843, Tardieu published his investigations, *De la Morve et du Farcin Chroniques*. It is to these writers and to the brothers Gamgee ("Glanders—Equinia," by Arthur Gamgee, M.D., and John Gamgee, in Reynolds's

System of Medicine, vol. i. 1866) that we owe almost all our knowledge of this terrible disease.

In the great majority of cases, the disease is transmitted from the horse, the ass, or the mule to man; but several instances have been recorded in which it has been transmitted from one human being to another. The disease is no doubt generally due to inoculation, but the virus is also probably capable of being absorbed by unbroken mucous membrane. Most of the recorded cases have occurred in men of good constitution and in the prime of life. The four varieties of this disease which occur in the horse have also been observed in man—viz., (1) acute glanders, (2) chronic glanders, (3) acute farcy, and (4) chronic farcy.

Acute glanders is the commonest form. The period of inoculation ranges, in the majority of cases, from three days to a week. If there is a distinct wound or abrasion through which the poison has been absorbed, the parts around the broken surface become red, tense, and painful, often before the appearance of any of the constitutional symptoms, such as a general feeling of illness, great depression of the spirits, headache, rigors, increased rapidity of the pulse, and pain in the joints. A characteristic pustular eruption, often accompanied by bullæ or blebs, appears on the face and limbs; and abscesses frequently occur on the face and about the principal joints. A yellow, purulent, fetid discharge, often mixed with blood, exudes from the nasal mucous membrane, which is invariably the seat of a pustular eruption, or of ulcerations. The prostration which is observable from the beginning increases during the course of the disease. The pulse becomes weak and frequent, the breathing difficult, the voice feeble, and the bowels very relaxed, the stools being extremely fetid. Delirium now sets in, which is followed by coma and death. Death usually occurs about the end of the second week, but the duration of the disease has been known to vary from three to fifty-nine days.—*Chronic glanders* is so rare an affection in man that it hardly requires notice. The course of the disease usually extends over several months; and only one case of recovery is reported.—*Acute farcy* seems only to differ essentially from acute glanders in the fact of there being no affection in the mucous membrane of the nostrils. The cutaneous eruption may or may not be present; in most cases, it is present, and the disease then follows exactly the same course as glanders. When there is no eruption, there is merely an inflammation of the lymphatic vessels and glands, or *adenitis* and *angeioleucitis* (q.v.), accompanied with the formation of soft subcutaneous tumors at various parts. This form of the disease often terminates favorably, or may merge into *chronic farcy*, which is characterized by the formation of an abscess on the forehead or elsewhere, which is followed by indolent and fluctuating tumors, which follow one another in various parts of the body, open spontaneously, and form very intractable ulcers. The disease usually runs its course in about a year. Of twenty-two cases recorded by Tardieu, six recovered.

Little need be said regarding treatment, since no remedies have been found to exercise any influence in checking the course of acute glanders. Arsenic, combined with strychnia, has been found useful in chronic glanders in the horse, and is recommended by the brothers Gamgee as worthy of trial in man; and some relief might probably be afforded by the application of weak injections of carbolic acid into the nostrils.

EQUINOC'TIAL is the same with the celestial equator. See EQUATOR, CELESTIAL. The E. points are those in which the E. and the ecliptic intersect. See ECLIPTIC. E. time is time reckoned from the moment when the point of Aries passes the vernal equinox. See EQUINOXES. This instant is selected as a convenient central point of a uniform reckoning of time for the purposes of astronomical observers.

E'QUINOXES. Sometimes the equinoctial points (see EQUINOCTIAL) are called the equinoxes. More commonly, by the equinoxes are meant the times when the sun enters those points, viz., 21st Mar. and 22d Sept., the former being called the vernal or spring equinox, and the latter the autumnal. When in the E., the sun, through the earth's rotation on its axis, seems to describe the circle of the equator in the heavens, and the days and nights are of equal length all over the world. At the vernal equinox, the sun is passing from s. to n., and in the northern hemisphere the days are lengthening: at the autumnal, he is passing from n. to s., and the days are shortening. As the earth moves more rapidly when near the sun, or in winter, the sun's apparent motion is not uniform, and it happens that he takes eight days more to pass from the vernal to the autumnal equinox, than from the latter to the former. The equinoctial points are not stationary. See ECLIPTIC.

EQUIP'MENT,—EQUIPAGE, in military matters, are names given to certain of the necessaries for officers and soldiers. During the Crimean war, many officers applied for and obtained money as compensation for the loss or injury of their E., comprising horses, horse-appointments, baggage, saddlery, and accouterments. Equipments issued to private soldiers are expected to last a certain number of years, and small deductions from their pay are made in the event of the articles not lasting the proper time. In those cases (in the English army) where a non-commissioned officer receives a commission on the ground of meritorious service, an allowance of £100, if in the infantry, or £150, if in the cavalry, is made to him to provide an equipment. The E. of a private soldier is often used as a name for the whole of his clothes, arms, and accouterments

collectively. The *equipage* of an army is of two kinds: it includes all the furniture of the camp, such as tents and utensils, under the name of *camp-equipage;* while *field equipage* comprises saddle-horses, baggage-horses, and baggage-wagons.

EQUIPMENT AND RECRUITING, BUREAU OF, a department in the U. S. navy having charge of supplying vessels with rigging, sail, anchors, and all stock necessary for a voyage; also, the managing of the enlistment of seamen and boys, and of the recruiting service generally.

EQUISETUM, a genus of cryptogamous plants, the structure and affinities of which are not yet well understood, but which many botanists regard as constituting a sub-order of ferns, whilst others prefer to make it a distinct order, *equisetaceæ.* The English name HORSE-TAIL is often given to all the species. They have a leafless, cylindrical, hollow, and jointed stem, each joint terminating in a membranous and toothed sheath, which incloses the base of the one above it. The fructification is at the summit of the stem in spikes, which somewhat resembles trobiles (cones), and are formed of scales bearing spore-cases on their lower surface. The spores are minute, oval, or round, green, and each accompanied with four elastic and hygrometrical threads. These threads are sometimes called *elaters,* but it is by no means certain that they are of the same nature with the spiral filaments so called, which are mixed with the spores of many *hepaticæ* (q.v.). Each thread terminates in a kind of club. The stems generally have lateral branches, angular, but otherwise similar in structure to the stem, growing in whorls from the joints; sometimes the stem is simple; or fertile stems are simple, and sterile stems are branched. The species of this genus contain a peculiar acid, called *equisetic acid.* Astringent and diuretic properties exist in these plants, and they were formerly used in medicine, but are not now regarded as of much value. It has been said that they are very injurious to cattle which eat them, but this seems to require confirmation. They abound chiefly in damp soils, and sometimes so much that the plow and harrow, or the grubber, must be employed to extirpate them. Some of them, however, grow in dry fields and gardens; whilst others are found chiefly in ditches or the banks of rivers. They exist in almost all parts of the world, and are seldom of large size, varying from a few inches to a few feet in height, but a comparatively gigantic species has recently been discovered in tropical America. The rough siliceous stems of some species are used for smoothing and polishing wood, particularly those of *E. hyemale,* which are imported into Britain in considerable quantities from Holland, under the name of DUTCH RUSHES. The stems of this species are unbranched, or a little branched only at the base. It is not uncommon in Britain, and is found also, rather sparingly, in North America. It has been proposed to cultivate it, as it grows well under trees, where few other plants would thrive. The stems of other species, as *E. arvense,* the most common of all the British species, are used for scouring tin and pewter vessels.

EQUITABLE DEFENSES at common law were introduced by the common law procedure act (15 and 16 Vict. c. 76, s. 83), whereby it was enacted that the defendant in any cause, and the plaintiff in replevin, where he would be entitled to relief against the judgment on equitable grounds, may plead the facts which entitle him to such relief. The effect of this enactment had been to extend materially the equitable jurisdiction of common law courts, by enabling them to give effect to a plea in cases where, though courts of law had no remedy, a court of equity would have afforded *unconditional* relief. It has been remarked by Pollock, C.B., *Clarke* v. *Laurie,* 26 *Law Jour.* Ex. 36, that "it is an established rule now . . . . that no equitable plea shall be permitted, except in a case where the plea and decision, and judgment of the court upon it, will work out and complete all the equity that belongs to the matter to which the plea refers." A defendant having pleaded an equitable defense at law, was not precluded from resorting to the court of chancery. All this, however, is obsolete, now that law and equity are consolidated, and the same defense is good in all courts alike.

EQUITABLE ESTATES, estates the right to which, according to the strict rules of English common law, was unrecognized, but which received full effect in a court of equity. These estates are the equity of redemption (q.v.) which a mortgagor has in his estate, subject to the mortgage, and the right of *cestui que trust* in a trust estate. Formerly, these interests were not even recognized by courts of law; but by 7 Geo. II. c. 20, and 15 and 16 Vict. c. 76, courts of law were empowered to take notice, and give effect to an equitable interest; and now that law and equity are merged together, the same court protects both.

EQUITABLE MORTGAGE is where a person, having an equitable interest in an estate, mortgages that interest. Thus, a *cestui que trust* may mortgage his estate under the trust, or a mortgagor, who has already mortgaged his estate, may convey his equity of redemption (q.v.) in security of his debt. In these instances, the interest operated upon being purely equitable, the transaction is an equitable mortgage. An equitable mortgage may also be effected by a deposit of title-deeds in security of debt. See MORTGAGE, ESTATE.

EQUITES. See EQUESTRIAN ORDER, *ante.*

EQUITY, COURTS OF, ENGLAND. The administration of justice in England once embraced two great branches, usually known as common law and equity. Speaking generally, it may be said that equity is partly corrective of the common law, partly sup

plementary of it; and from this it follows that, in an almost endless variety of matters, the decision of a court would vary according as it was a court of equity or a court of common law; the equity courts giving remedies in cases where the common law—though it may acknowledge a hardship—sees no wrong, and acknowledging and enforcing rights which the common law does not admit. The anomaly of keeping up two sets of courts, acting on different principles, the one to do justice where the traditions of the other prevent it from doing justice, or its rules require it to do injustice, had long been perceived; it had been found, too, that this arrangement was inconvenient as well as anomalous. Attempts had been made to produce a gradual fusion of the conflicting systems by clothing the common-law courts to some extent with the power of resorting to the remedies and admitting the principles employed in the courts of equity; and these attempts had proved partially successful. In 1873, therefore, the legislature proceeded to make provision for completely revolutionizing the judicial system of England, with a view to getting rid, at one stroke, of its inconvenient and anomalous double system of courts. This was done by the judicature act passed in that year, a measure that was soon afterwards modified in important particulars by other acts passed in 1874 and 1875. These judicature acts did not come into force till the first of Nov., 1875; and various rules and orders have been made in accordance with them. The judicature act merged the existing courts both of equity and common law in one supreme court of judicature, which consisted of a high court of justice, arranged in five divisions, all of them courts of first instance. There was an appeal in a few cases to the privy council; and in the other cases, to the court of appeal, and then the house of lords. In the high court there is now a chancery division, before which, at first, the greater part of the equity business requires to be brought; and it is expressly provided that where the rules of the common law conflict with those of equity, every court is to give effect to the latter. The conflict between common law and equity will henceforth be at an end; but as the sources from which the law of the future will be derived, they will still be referred to. Until the recent change, the courts of equity were the lords justices' court, the master of the rolls' court, and the courts of the three vice-chancellors.

The origin of a separate equitable jurisdiction in England is to be found in the early adoption by the courts of common law of certain set forms for the redress of grievances, and their refusal to apply any remedy to cases which did not fall within those limits. Suitors finding that in numerous cases redress was not to be obtained in the ordinary legal tribunals, had recourse to the king as the fountain of justice, who, sitting in council, heard the complaints upon their merits without reference to the technicalities of law. As early as the reign of Edward I., the practice began to be adopted of delegating to the chancellor the petitions referred to the king. In this reign, an attempt was made to devise a method whereby the common-law courts should be made the sole tribunal for the redress of grievances. By the statute of Westminster the second (13 Edw. I. c. 24), it was enacted that whenever a case occurred requiring a new writ, the chancery (in which all suits took their rise) should frame a new writ to suit the case. This statute was never acted upon to the purpose intended; but in the reign of Edward III. its provisions were made use of by John Waltham, who was then chancellor, to introduce the writ of *subpœna* (q.v.) returnable to chancery only, whereby the lord chancellor's court was made the forum of a large class of causes. "From this time," says Mr. Spence (*Chancery Jurisdiction*, i. 338), "suits by petition or bill without any preliminary writ became a common course of procedure before the chancellor, as it had been in the council. On the petition or bill being presented, if the case called for extraordinary interference, a writ was issued by the command of the chancellor, but in the name of the king, by which the party complained against was summoned to appear before the court of chancery, to answer the complaint and abide by the order of the court. Thus was introduced into chancery the practice of examining upon oath the party in the cause, a practice unknown at that time to common law. The cases heard in the chancery courts were decided upon the principles of *honesty*, *equity*, and *conscience*. The next step which tended to widen the equitable jurisdiction of the chancery courts, was the exclusion of the Roman law from the courts of common law. This was effected by a prohibition of the judges in the reign of Richard II. One result of this prohibition was to exclude altogether from the common-law courts the question of trusts. The court of chancery at once proceeded to give a remedy in this class of cases, which has ever since formed the most important branch of the equitable jurisdiction of that court. The equitable jurisdiction of the court of chancery in matters of fraud is to be traced to the abolition of the star chamber (q.v.) in the reign of Charles I. Thus sprung up in England jurisdiction of the court of chancery as a court of equity. It is not, however, to be supposed that the system administered in courts of equity is an arbitrary one at the pleasure of the presiding judge. Such probably was the case on the first introduction of the equity jurisdiction; but as time progressed, the decisions of previous judges formed precedents for their successors, and the precepts of the Roman law were much imitated as a code for the regulation of the courts. Now, all the judges acknowledge the authority of decided cases —of the practice of the court—quite as fully as did courts of common law; and though new cases perhaps occur more frequently than they did in the courts of common law, they are dealt with as they were in courts of common law, by the application to them,

as far as possible, of accepted principles derived from the decisions of the court of chancery, or the principles of the Roman law.

The jurisdiction of equity courts was divided under three principal heads—exclusive, concurrent, and assistant. The first consists almost entirely of the administration of trusts; the second comprises questions of fraud, of account, and also, it is said (Smith's *Principles of Equity*, 217), of specific performance of agreements. This matter appears, however to fall more naturally under the assistant jurisdiction. In order to appreciate the domain of the equity courts, it must be borne in mind that common law confines its remedy usually to the awarding of damages, and to the pronouncing a judgment absolutely in favor of either plaintiff or defendant; equity, on the other hand, goes into all the merits of the case, and will deliver a modified judgment where circumstances demand it. The judges of the supreme court now all administer equity as well as law in the same manner as the court of session in Scotland had been accustomed to do from the beginning. In whichever division of the high court an action commences, that division must dispose of all the issues raised, and pursue these to final judgment. It is true one of the divisions is still called the chancery division, and actions which used to be begun in equity courts now usually begin there still. But there is a power in such division to send an issue of fact to be decided on circuit, and after trial the division resumes its jurisdiction and works it out. The chancery division consists of judges chosen from the bar generally; and the court of appeal, which sits in two divisions, consists also of judges some versed in chancery business, and some versed in common-law business. The lord chancellor since 1875 has confined his sittings to the house of lords, and occasionally to the court of appeal and to the privy council, of all of which courts he is *ex officio* a member.

EQUITY, PRINCIPLES OF, in their widest sense, are the principles of eternal justice, of which all human laws are but adaptations. "Equity," says lord Stair (i. 1, s. 17), "is the body of the law, and the statutes of men are but as the ornaments and vestiture thereof." In this sense equity coincides with the Roman precepts of law—"*honesté vivere, alterum non lædere, suum, cuique tribuere*"—(*Inst.* i. 1, s. 3), and with the principles of justice as laid down by the inspired writer—"to do justly, to love mercy, and to walk humbly with thy God"—Micah, vi. 8. As the object of human law is to give expression to these principles, equity is thus the basis of law. But it is impossible, in the nature of things, that any code of laws should provide a remedy suited to every particular case; it has, therefore, been found necessary in every civilized nation, to establish some form of authority which should control the rigor and remedy the deficiency of positive law. Thus, it is the function of the law to lay down a code of rules whereby the rights of property and the transactions of commerce shall be regulated; but by the diversities of life it happens that various circumstances will occur to cause these fixed rules to operate harshly or unjustly in particular cases. A party may complain that a contract duly entered into with all legal formalities has been obtained by fraud; the owner of an estate is incapable from infacy or lunacy of managing his affairs; a person ostensibly the owner of large property is found to be placed in possession in trust only for the benefit of others. In these and many other cases, the party who, in compliance with every rule of the law, is in possession, is not in fact the person who should in justice exercise the right. Here equity steps in. While, then, all law may be said to be equitable, inasmuch as it is the purpose of law to dispense justice, yet, in the technical sense, the term equity is confined to those cases not specially provided for by positive law. But, on the other hand, experience has shown that it would be most inconvenient, and subversive of order, if equity should arbitrarily interpose to remedy every apparent grievance, and therefore it is that the operation of equity is checked within certain limits. "There are many cases against natural justice which are left wholly to the conscience of the party, and are without any redress, equitable or legal; and so far from a court of equity supplying universally the defects of positive legislation, it is governed by the same rules of interpretation as a court of common law, and is often compelled to stop where common law stops. It is the duty of every court of justice, whether of law or of equity, to consult the intention of the legislature."—Story, *Principles of Equity*, s. 14. Hence arises the maxim, that "equity follows the law." The principles of equity, therefore, as understood in modern times, may be said to be those principles of natural justice which are permitted to modify the rigor of positive law. In applying these principles to practice, the equitable jurisdiction has been intrusted by all nations, with the exception of England (but see EQUITY COURTS), to the same courts in which the positive law was administered. In the infacy of states, the boundaries of law and equity, and the functions of the equity judge, were not so clearly defined as in the present day. By the Roman law, a power, called the *jus honorarium* or *nobile officium*, was reposed in the prætor of controlling on equitable grounds the decisions of the ordinary tribunals.* Each prætor, on entering upon his office, published an edict declaring the principles by which he would be guided in discharging his duty as an equitable magistrate. The principles so declared were binding on the prætor during his year of office, but not on his successor. There can, however, be little doubt that in process of

* This function of the prætor commenced in the earliest times under the kings of Rome, and continued to attach to the office through all the changes which distracted the nation.

time a system of equity was gradually evolved: and ultimately, in the reign of the emperor Hadrian, the edicts of the prætors were collected by a civilian named Julianus, and embodied in a single code called the perpetual edict. See EDICT. According to the practice of modern nations, the courts of law are accustomed to exercise a certain equitable jurisdiction whereby, within prescribed limits, the rules of law may be modified. In Scotland, the equitable power of the court of session is called the *nobile officium* (q.v.).

EQUITY OF REDEMPTION, the interest which a mortgager has in an estate which he has mortgaged. An E. of R. may be devised, granted, or entailed, and the course of descent to an E. of R. is governed by the same laws as the descent to the land would have been. Formerly, the equitable interest of a mortgager could not be recognized in a court of law, but by 7 Geo. II. c. 20, it is provided that where no suit is pending in a court of equity, either for foreclosure or redemption, but the mortgagee attempts to obtain possession by bringing an action of ejectment, in such a case, the court may restore his estate to the mortgager, on his payment of the principal and interest due on such mortgage.

EQUIVALENTS, in chemistry. See ATOMIC WEIGHTS.

ERA. See CHRONOLOGY.

ÉRARD, SÉBASTIEN, 1752–1831; b. Strasburg; distinguished for improvements upon the piano and the harp. He went to Paris, where the duchess of Villeroi became his patron, and in her house he made his first piano, which was one of the earliest manufactured in France. He became suddenly famous, and established a large manufactory in Paris, and during the revolution in London. Thenceforward devoting his life to the development and improvement of his favorite instrument, he brought it to a perfection before unknown.

ERASED AND ERADICATED, heraldically signifies that an object is plucked or torn off, and showing a ragged edge; as opposed to *coupe* or *coupy*, cut, which shows a smooth edge. A tree plucked up by the roots is said to be eradicated.

ERASISTRATUS, one of the most famous physicians and anatomists of ancient times, flourished in the 3d c. B.C., and is supposed to have been born at Inlis, in the island of Ceos. He resided for some time at the court of Seleucus Nicator, king of Syria, and while there acquired great renown by discovering and curing the disease of the king's eldest son, who was pining for the love of the young and beautiful Stratonice, whom his father in his old age had married. Afterwards E. lived for some time at Alexandria, where, giving up practice, he devoted himself with great energy and success to his anatomical studies. The date of his death, which seems to have taken place in Asia Minor, is not known. He founded a school of medicine, wrote several works on anatomy—in which branch he was most celebrated—on practical medicine, and pharmacy. He believed that the heart was the origin both of the veins and arteries, and, had it not been his conviction that the arteries contained *air* instead of *blood*, little doubt is entertained but that he would have anticipated Harvey in the discovery of the circulation of the blood. Of his numerous writings only some obscure fragments and titles have been preserved. Compare Hieronymus, *Erasistrati et Erasistrateorum Historia* (Jena, 1790).

ERASMUS, DESIDERIUS, one of the most vigorous promoters of the reformation, was b. at Rotterdam, 28th Oct., 1467. He was the illegitimate son of a Dutchman named Gheraerd, or Garrit, by the daughter of a physician. In accordance with the fashion among scholars of his time, he changed the name Gheraerd into its Latin and Greek equivalents Desiderius Erasmus (more correctly Erasmius)—meaning desired, loved. Till his 9th year, E. was a chorister in the cathedral at Utrecht. He was then sent to school at Deventer, where his talents began to display themselves in so brilliant a manner, that it was even then predicted that he would one day be the most learned man of his time. After the death of his parents, whom he lost at the age of 14, his guardians determined on bringing him up to a religious life, and—with the intention, it is said, of sharing his small patrimony among themselves—in his 17th year, placed him in the monastery of Emaus, near Gouda. From this constrained manner of life, however, he was released by the bishop of Cambray. After having taken priest's orders in 1492, he went to Paris, to perfect himself in theology and the humane sciences. Here he supported himself in a somewhat precarious manner, by giving private lectures, and in 1497, accompanied some Englishmen, who had been his pupils, to England, where he was well received by the king. He, however, soon returned to Paris, and in 1506, to enrich his knowledge, visited Italy. At Turin, he took the degree of D.D. Shortly after, he applied to the pope for a dispensation from his monastic vows, which was granted. During the course of his journey, he visited Venice, Parma, Rome, and other interesting cities, in company with his pupil, Alexander Stuart, a natural son of James IV. of Scotland, who, along with his father, was afterwards slain at the battle of Flodden. At Rome, the most brilliant prospects were held out to him. Cardinal Grimani, a famous lover of learning in that day, offered, out of his admiration for E., to make him "partaker of his house and fortunes." Other eminent men vied with Grimani in showing respect to the young scholar, among whom may be mentioned John de' Medici, afterwards Leo X., cardinal Raphael of St. George, and Giles of Viterbo, gen. of the Augustines. The pope (Julius II.) also offered him a place among his penitentiaries,

an office of considerable consequence, and, it would appear, a "step to the highest preferments in that court." E., who had always an eye to the main chance, regretted, at a later period of his life, that he had not accepted the offers held out to him in Rome, but meanwhile, having pledged himself to return to England, where also he had many friends, he set out for that country in 1509, after the accession of Henry VIII. In several of the cities through which he passed he met with friends and patrons, who wished him to settle amongst them, but as Henry was a correspondent of his, E. was induced to cherish the highest hopes of personal favor from that monarch, and could not be prevailed on to stay for more than a very brief period. He had no sooner, however, arrived in England than he found out his mistake. At first, he lodged with sir Thomas More, and during his stay with him composed his *Encomium Moriæ*, or Praise of Folly, the purpose of which is to expose all kinds of fools, but especially those who flourished in the church, not sparing the pope himself. For a short time he filled the office of professor of Greek at Oxford, but on the whole was very scantily supplied with the means of subsistence. In 1514, he returned disappointed to the continent, and resided chiefly at Basel, where he died, 12th July, 1536. E.'s extensive and profound learning was equaled by his refined taste and brilliant wit. A natural love of independence and quiet made him prefer a life of learned leisure and retirement to one of greater publicity; nevertheless, the readiness with which he assumed the character of an adroit man of the world, brought upon him the hostility of many of the nobler spirits of his time. He was no hero, and he knew it. He frankly confesses that "he had no inclination to die for the sake of the truth." Luther, in whom the soul and courage of the apostle Paul seemed to be revived, overwhelmed him with reproaches for his cowardice in regard to the reformation. But we must not forget that E. by his mental constitution was averse to enthusiasm. He was a scholar and a critic, not a preacher or iconoclast, and he was at least honest enough to abstain from denouncing the opinions of Luther, though he disapproved strongly of his violent language. Besides, there was a tincture of rationalism in the great Dutchman, which probably helped to chill his love of *mere Lutheranism.* But his services in the cause of science were great and lasting, and his writings are still esteemed for the importance of the subjects treated of, and their classical style. Besides editing several of the ancient authors, and various philological and theological writings, he prepared the earliest edition of the Greek Testament, which appeared at Basel in 1516. This is reckoned by some his greatest work. Michaelis says that perhaps there never existed an abler editor of the New Testament, and that E. possessed in the highest degree natural abilities, profound learning, a readiness in detecting errors, with every qualification that is requisite to produce critical sagacity. His best known work, however, is his *Colloquia*, a masterpiece. Of all his writings, this has exercised the greatest influence. The first edition appeared in 1522, but did not please E., who issued a second during the same year. A third appeared in 1524. This book, which was meant, according to Erasmus, only to make youths better Latinists and better men, was condemned by the Sorbonne, prohibited in France, and burned in Spain. No one who takes up the book will wonder at its condemnation. It contains the most virulent and satirical onslaughts on monks, cloister-life, festivals, pilgrimages, etc., but it is disfigured by lewd and unchaste passages, which are wholly inexcusable. The work has been translated into almost all the modern languages. His *Encomium Moriæ*, or Praise of Folly, has been already mentioned. It was published in the original, with a German translation, and illustrations by Holbein, by W. G. Becker (Basel, 1780). E. himself superintended an edition of his works, published by Frobenius in Basel. The most complete edition is that of Leclerc (10 vols., Leyden, 1703–6). The life of E. has been written in French by Burigny (2 vols., Paris, 1758), in German by Müller (Hamburg, 1828), and in English by Knight (Cambridge, 1726, and Drummond (2 vols., 1873).

ERASTUS, Thomas, a learned physician and theologian, was b. at Baden in Switzerland, 7th Sept., 1524. His real name was *Lieber*, which, according to the fashion of his times, he translated into Greek. In 1540, he went to the university of Basel, where he studied divinity, philosophy, and literature. He subsequently visited Italy, where he betook himself to medicine, and obtained the degree of M.D. from the university of Bologna. After an absence of nine years, he returned to his own country, and lived for some time at the court of the princes of Henneberg, where he acquired a great reputation as a medical practitioner. The elector palatine, Frederick III., now invited him to his court, and appointed him first physician and councilor of state. He also conferred on him the chair of physic in the university of Heidelberg. In 1581, he was selected to fill a similar office at Basel, where he died, Dec. 31, 1583, after establishing a liberal foundation for the provision and education of poor students in medicine, which was long called the *Erastian foundation.* Among E.'s medical works may be mentioned his *Disputationum de Medicina Nova Philippi Paracelsi* (Basel, 1572–73); *Theses de Contagio* (Heidelberg, 1574); and *De Occult. Pharmaco. Potestatibus* (Heidelberg, 1574). As a physician, E. is creditably characterized by his distrust of abstract and *à priori* theorizing, and his conviction that experimental investigation is the only road to knowledge. But his fame now rests chiefly on what he wrote in ecclesiastical controversy. In his book *De Cœna Domini*, he contended for the figurative interpretation of the passage, "This is

my body," etc., and supported this view at the conference held at Maulbron between the divines of the palatinate and those of Wittenberg. But his great work is his *Explicatio Quæstionis Gravissimæ de Excommunicatione*. Although this work was not published till some years after his death, E. had published the same opinions as it contains in the form of theses, directed against Gaspar Olevianus, a refugee from Treves, and various other persons, who were anxious to confer on ecclesiastical tribunals the power of punishing vices and misdemeanors. E. denied the right of the church to excommunicate, exclude, absolve, censure—in short, to exercise discipline. Denying "the power of the keys," he compared a pastor to a professor of any science, who can merely instruct his students; he held that the ordinances of the gospel should be open and free to all, and that penalties being both in their nature and effect *civil* and not *spiritual*, ought to be inflicted only by the civil magistrate. E. formed no *sect*, neither did he wish to do so. His desire was, in fact, of an exactly contrary character—viz., to preserve an external harmony at the expense even of the purity of the visible church. He would have let the wheat and tares grow together until the end of the world. Many eminent men, especially in the church of England, have shared similar opinions both before and after E., such as Cranmer, Redmayn, Cox, Whitgift, Lightfoot, Selden, etc. The term Erastian has long been a favorite epithet of reproach in Scotland, but has not been employed with any great precision. All persons who deny the power of an established church to alter her own laws without the consent of the state—as, for example, the law of patronage—are generally accused of *Erastianism*, although the principles of E. have literally nothing to do with such a question. An English translation of the *Explicatio* was published in 1669, and was re-edited by Dr. Robert Lee of Edinburgh in 1845.

ERA'SURE, or RAZURE, as it is more commonly called in England, from the Latin *rado*, to scrape or shave, is the scraping or shaving of a deed or other formal writing. In England, except in the case of a will, the presumption, in the absence of rebutting evidence, is that the erasure was made at or before execution.—Doe ex dem Tatham *v.* Gattamore, 17 L. T. Rep 74. "If an alteration or erasure has been made in any instrument subsequent to its execution, that fact ought to be mentioned (in the abstract, or epitome of the evidences of ownership), together with the circumstances under which it is done, and more particularly so as a fraudulent alteration by either of those means, if made by the person himself taking under it, would vitiate his interest altogether. It was formerly considered that an alteration, erasure, or interlineation (q.v.), would void the whole instrument, even in those cases where it was made by a stranger; but the law is now otherwise, as it is clearly settled that no alteration made by a stranger will prevent the contents of an instrument from retaining its original effect and operation, where it can be plainly shown what that effect and operation actually was. To accomplish this, the mutilated instrument may be given in evidence as far as its contents appear; and intrinsic evidence will be admitted to show what portions have been altered or erased, and also the words contained in such altered or erased parts; but if, for want of such evidence, or any deficiency or uncertainty arising out of it, the original contents of the instrument cannot be ascertained, then the old rule would become applicable, or, more correctly speaking, the mutilated instrument would become void for uncertainty." —Hughes's *Practice of Conveyancing*, i. 124, 125. If a will contains any alterations or erasure, the attention of the witnesses ought to be directed to the particular parts in which each alteration occur, and they ought to place their initials in the margin opposite, before the will is executed, and to notice this having been done by a memorandum, added to the attestation clause at the end of the will (*Ib.* p. 945). See also 1 Vict. c. 26. In Scotland, the rule as to erasure is somewhat stricter than in England—the legal inference being that such alterations were made after execution. As to necessary or *bona fide* alterations which may be desired by the parties, corrections of clerical errors, and the like, after the deed is written out, but before signature, the rule in Scotland is, that "the deed must show that they have been advisedly adopted by the party; and this will be effected by mentioning them in the body of the writing. Thus, if some words are erased and others superinduced, you mention that the superinduced words were written on an erasure; if words are simply delete, that fact is noticed; if words are added, it ought to be on the margin, and such additions signed by the party, with his Christian name on one side, and his surname on the other; and such marginal addition must be noticed in the body of the writ, so as to specify the page on which it occurs, the writer of it, and that it is subscribed by the attesting witnesses."—Menzies's *Lectures on Conveyancing*, p. 124. The Roman rule was, that the alterations should be made by the party himself, and a formal clause was introduced into their deeds to this effect, "*Lituras, inductiones, superinductiones, ipse feci.*" As a general rule, alterations with the pen are in all cases to be preferred to erasure; and suspicion will be most effectually removed by not obliterating the words altered so completely as to conceal the nature of the correction. "The worst kind of deletion," says lord Stair, "is when the words deleted cannot be read (but if they are scored that they can be read, it will appear whether they be *de substantialibus*), for if they cannot be read, they will be esteemed to be such, unless the contrary appear by what precedes and follows, or that there be a marginal note, bearing the deletion, from such a word to such a word, to be of consent."

E'RATH, a co. in central Texas, drained by Bosque river; 900 sq.m.; pop. '70, 1801—89 colored. The surface is rolling and tolerably fertile, but best adapted to pasturage. Co. seat, Stephensville.

ERATO, one of the nine muses, daughters of Jupiter and Mnemosyne. She presided over amatory and nuptial poetry.

ERATOS'THENES, an eminent Greek writer, called, on account of his varied erudition, the *philologist*, was b. at Cyrene 273 B.C. Among his teachers were Lysanias the grammarian, and Callimachus the poet. By Ptolemy Euergetes, he was called to Alexandria to superintend his great library. Here he died of voluntary starvation, at the age of 80, having become blind, and wearied of life. As an astronomer, E. holds an eminent rank among ancient astronomers. He measured the obliquity of the ecliptic, and the result at which he arrived—viz., that it was 23° 51′ 20″—must be reckoned a very fair observation, considering the age in which he lived. Hipparchus used it, and so did the celebrated astronomer Ptolemy. An astronomical work which goes under the name of E., but which is certainly not his, is still extant, and is called *Katasterismoi;* it contains an account of the constellations, their fabulous history, and the stars in them. It is believed, however, that E. did draw up a catalogue of the fixed stars, amounting to 675; but it is lost. A letter to Ptolemy, king of Egypt, on the duplication of the cube, is the only complete writing of his that we possess. E.'s greatest claim to distinction, however, is as a geometer. In his attempt to measure the magnitude of the earth, he introduced the method which is used at the present day, and found the circumference of the earth to be 252,000 stadia; which, according to Pliny, is 31,500 Roman miles. But as it is not known *what* stadium E. used, it is possible that he came nearer the actual circumference than the above figures indicate. His work on geography must have been of great value in his times: it was the first truly scientific treatise on the subject. E. worked up into an organic whole the scattered information regarding places and countries related in the books of travels, etc., contained in the Alexandrian library. He also wrote on moral philosophy, history, grammar, etc. His work on the Old Attic Comedy appears, from the remains we possess, to have been a learned and very judicious performance. Such fragments of E.'s writings as are still extant have been collected by Bernhardy in his *Eratosthenica* (Berlin, 1822).

ERBIUM (symbol E) is a rare metal, the compounds of which are found in a few scarce minerals, especially in *gadolinite*, obtained from Ytterby, in Sweden. In its compounds and properties it resembles the metal aluminium.

ERCILLA Y ZUÑIGA, ALONSO, a Spanish poet, was b. at Madrid, Aug. 7, 1533. He was the third son of a Spanish jurist, and at an early period became page to the infanta Don Philip, son of Charles V., accompanying him on his journey through the Netherlands, and some parts of Germany and Italy, and, in 1554, to England, on the occasion of the celebration of Philip's nuptials with queen Mary. Shortly after, E. went with the army dispatched to America to quell the insurrection of the Auracanians on the coast of Chili. The difficulties with which the Spaniards had to contend, the heroism displayed by the natives in the unequal contest, and the multitude of gallant achievements by which this war was distinguished, suggested to E. the idea of making it the subject of an epic poem. He began his poem on the spot, about the year 1558, occasionally committing his verses, in the absence of paper, to pieces of leather. An unfounded suspicion of his having plotted an insurrection involved him in a painful trial, and he had actually ascended the scaffold before his innocence was proved. Deeply wounded, the brave soldier and poet turned to Spain, but Philip treating him with coldness and neglect, E. made a tour through France, Italy, Germany, Bohemia, and Hungary. For some time he held the office of chamberlain to the emperor Rudolf II., but in 1580 returned to Madrid, where he in vain exerted himself to realize an independence. The latter years of his life were spent in obscurity and poverty at Madrid, where he died, at what period has not been ascertained. His historic epos, written in the octo-syllabic measure, and entitled *Araucana*, is, with the exception of a few episodes, a faithful description of actual events. Cervantes, in his *Don Quixote*, compares it with the best Italian epics, and it has undoubtedly not a little of the epic style and spirit. The first part is the freshest in character, having been completed before the author's return to Europe, where it was first published separately (Madrid, 1569). The second part appeared nine years later. In it E., by the introduction of episodes, yielded more to the taste of the time; and this was still more the case in the third part, which was first published, along with the two others, in 1590. In Spain, and likewise in other countries, many reprints of the poem appeared (the most elegant, 2 vols., Madrid, 1776; the most accurate, 2 vols., Madrid, 1828). A continuation was published by Don Diego Santistevan Osorio, of Leon (Salamanca, 1597). A German translation has been published by Wintering (2 vols., Nuremberg, 1831).

ERCKMANN-CHATRIAN (EMILE ERCKMANN and ALEXANDRE CHATRIAN), two French men of letters, the first of whom was born 20th May, 1822, at Phalsbourg; the second, 2d Dec., 1826, in the village of Soldatenthal, commune of Abreschwiller, both in what was then the French dep. of Meurthe, but is now reunited to Germany as part of the imperial territory of Alsace-Lorraine. Erckmann, the son of a bookseller,

went through a rather irregular course of study at the college of his native town, went to Paris in 1842 to study law, which he broke off several times, and only passed his third examination in 1857, and finally abandoned the study in the following year. During the interval, he had set himself to make a name in literature, in co-operation with M. Chatrian. The latter, belonging to an old family of glass-makers in Meurthe, ruined by reverses in trade, was acting as tutor at the college of Phalsbourg, when, in 1847, he was introduced to M. Erckmann. From that time the two friends employed their pens in the same works, which they signed with the two names united in one; and it was only about 1863 that the authors informed their readers that the numerous works of fiction, which had obtained a wide-spread popularity, and were supposed by the general public to be the work of a single writer, were the fruits of their friendly collaboration. Their early works attracted comparatively little notice; and it is said that their first work was rejected by all the newspapers of Paris, and by many provincial journals. In 1848, they published several feuilletons in the *Démocrate du Rhin*, which had just been started: *Le Sacrifice d'Abraham*, *Le Bourgmestre en Bouteille*, etc., which they have since published separately. At the same time they wrote a drama, *Le Chasseur des Ruines*, for the Ambigu-Comique, which the theater accepted, subject to changes, which they refused to make. They produced another drama, *L'Alsace en* 1814, for the theater of Strasburg, which was suppressed by the prefect on the second representation. They wrote numerous novels at this time for different journals, some of which were very little noticed, while others remained in MS. for years. Despairing of being able to live by their pens, Erckmann recommenced his law studies, and Chatrian obtained a situation in the office of the Eastern railway. It was not till 1859 that *L'Illustre Docteur Mathéus* (1859, in-18; 3d edition, 1864), published by the Librairie-Nouvelle, gave a certain éclat to the collective name of Erckmann-Chatrian. *Le Fou Yégof* (1862, in-18) is one of a series of novels, the subjects of which are taken from their national history, and gives a picture of the invasion of 1814. *Le Conscrit de* 1813 (1864) and *Waterloo* (1865) are fragments of an autobiography, and are supposed to be the recollections of a common soldier, and relate the disastrous campaigns of 1813 and 1814. These may be called the gems of their collection. *Le Joueur de Clarinette* (1863), a simple story of a village musician, and *Les Amoureux de Catherine*, another tale of village life in the same volume, are nearly perfect. *L'Homme du Peuple* appeared in 1865, and is less favorably spoken of as a work of art. It pictures the life of the modern French workman.' In 1866, appeared *La Maison Forestière*, and *La Guerre;* in 1867, *Le Blocus*, which has been translated under the title, *The Blockade of Phalsbourg;* a historical romance in 1868, *Histoire d'un Paysan;* in 1869, *Le Juif Polonais*, a play. Among their latest works are *The Story of the Plébiscite by one of the* 7,500,000 *who voted Yes* (trans. in *Cornhill Magazine*, 1871–72); and *Brigadier Frederic: a Story of an Alsatian Exile* (Eng. trans. 1875).

ERDMANN, JOHANN EDUARD, a German philosopher; b. 1805; studied theology at Dorpat, attended the lectures of Schleirmacher and Hegel, and became a pastor. In 1836, he was appointed professor of philosophy at Halle. He has published a number of works, the most important of which is an attempt to give a learned explanation of the *New Philosophy*.

ERDMANN, OTTO LINNE, 1804–69; a German chemist, educated at Dresden and the university of Leipsic; professor of chemistry at Leipsic, where he established a model laboratory. He made important discoveries in the qualities of nickel, and of indigo and other dye-stuffs. He founded a journal devoted to chemical science, and published a number of works on the subject.

ER'EBUS—the name of one of the sons of Chaos—signifies darkness, and is used specially to denote the dark and gloomy cavern beneath the earth, through which the shades pass in going to Hades.

ER'EBUS, MOUNT, and MOUNT TERROR, volcanoes discovered in 1841 in South Victoria land, in the Antarctic ocean, lat. 77½° s. The first is 12,400 ft. high; the other about 11,000 ft. When discovered, Mt. Erebus was in active eruption.

ERECHTHEUS or ERICHTHO'NIUS, and ERECHTHE'UM. Erechtheus, an Attic hero, is said to have been the son of Hephaestus and the earth, and to have been reared by Athena. One form of the tradition states that when a child he was placed by Athena in a chest, which was intrusted to Agraulos, Pandrosos, and Herse, the daughters of Cecrops, with the strict charge that it was not to be opened. Agraulos and Herse, however, unable to restrain their curiosity, opened the chest, and discovering a child entwined with serpents, they were seized with madness, and threw themselves down the most precipitous part of the Acropolis. Afterwards Erechtheus was the chief means of establishing the worship of Athena in Attica. He is regarded as the founder of the Erechtheum, the temple of Athena Polias, guardian of the city. This original Erectheum, which contained Erechtheus's tomb after his death, and which was called by his name, was burned by the Persians, but a new and magnificent temple was raised upon the same site—n. of the Parthenon, and near the northern wall of the Acropolis—in the beginning of the 4th c. B.C. The second Erechtheum was a splendid structure of the Ionic order, of an oblong shape, extending from e. to w., abutting in side chambers at the western end, towards the n. and s., and having porticoes adorned with columns at its eastern, its northern, and southern extremities. It is now a complete ruin.

ERECTION, Lords of, those of the nobility in Scotland to whom the king, after the reformation, granted lands, or tithes, which formerly belonged to the church. They were also called titulars of tithes; the gifts being by no means confined to the nobility. These titulars had the same rights to erected benefices, both in lands and tithes, which had formerly belonged to the monasteries and other religious houses. The grants were made under the burden of providing competent stipends to the reformed clergy—an obligation which was very little attended to by the grantees, prior to the decrees arbitral of Charles I., in 1629. Ersk. B. ii. tit. 10, s. 18.

ER'EGLI, or Erekli (anc. *Heraclea*), a t, and port in Asia Minor, on the Black sea, 128 m. e.n.e. of Constantinople; pop. 5,000. There is a good harbor, some ship-building, and export trade in timber, coal, silk, linen, wax, etc. The coal mines are extensive, and yield much of the supply of Constantinople. E. is the place where the 10,000 Greeks under Xenophon embarked on their return.—Another town of the same name, 55 m. n.w. of Constantinople, has a harbor on the sea of Marmora.

EREMACAUSIS (Gr. *ēremα*, gently, and *kausi*, combustion) is a term originally proposed by Liebig to indicate the slow process of combustion at ordinary temperatures, which ensues when organic compounds, such as wood, are left exposed to the air, and gradually rot away or decay. The process consists in the oxygen (O) of the air combining with the hydrogen (H) of the wood forming water (HO), and in less quantity with the carbon (C) forming carbonic acid (CO_2), leaving a brown mold or powder, called by chemists ulmin, or humus, in which carbon preponderates.

ERETRIA, a city in the island of Eubœa, founded before the war of Troy, and anciently the rival of Chalcis in commerce. It was destroyed 490 B.C., by the Persians, but was soon rebuilt, and was active in the Peloponnesian war. It was the seat of the school of philosophy established by Menedemus, a disciple of Plato. The ruins of the city are still visible.

ERFURT, a city of Prussian Saxony, anciently capital of Thuringia, stands in a highly cultivated plain, on the right bank of the Gera, 14 m. w. of Weimar. Till 1873, E. was strongly fortified, and was accounted a fortress of the second rank. Its two citadels, the Petersberg and the Cyriaksburg, were both formerly monasteries. Among the numerous churches, the cathedral and the church of St. Severus are the finest. The cathedral is one of the most venerable Gothic buildings in Germany, and possesses, besides a very rich portal, sculptures dating from the 11th to the 16th century. Of the convents, only that of the Ursuline nuns remains. The monastery of St. Augustine, famous as the residence of Luther, whose cell was destroyed by fire in 1872, was converted in the year 1820 into an asylum for deserted children. The other remarkable buildings are the university, founded in 1378, and suppressed in 1816; the royal academy; the library, containing 60,000 volumes; numerous educational establishments, infirmaries, etc. Pop. '71, 43,616; '75, 48,030. Horticulture and an extensive trade in seeds are carried on. The principal manufactures are woolen, silk, cotton, and linen goods, yarn, shoes, stockings, tobacco, leather, etc.

E. is said to have been founded in the beginning of the 5th c. by one Erpes, from whom it took its original name of Erpesford. During the middle ages, at the time of its highest prosperity, E. was strongly fortified, and contained 60,000 inhabitants. In 740, St. Boniface founded a bishopric at E., and in the year 805 it was converted into an entrepôt of commerce by Charlemagne. It afterwards belonged to the Hanse-league, then to the elector of Mainz, from 1801–6 to Prussia, and from that time until 1813 it was under French rule. E. was finally restored to Prussia by the congress of Vienna. In the spring of 1850, the parliament of the states, which had combined together for union, held its sittings at Erfurt.

ERGOT, a diseased condition of the germen of grasses, sometimes also observed in some of the *cyperaceæ*. It begins to show itself when the germen is young; different parts of the flower assume a mildewed appearance, and become covered with a white coating composed of a multitude of minute spore-like bodies mixed with delicate cob-web like filaments; a sweet fluid, at first limpid, afterwards viscid and yellowish, is exuded; the anthers and stigmas become cemented together; the ovule swells till it greatly exceeds the size of the proper seed, bursts its integuments, and becomes elongated and frequently curved, often carries on its apex a cap formed of the agglutinated anthers and stigmas, and assumes a gray, brown, purple, violet, and at length a black color, as the viscid exudation dries and hardens. The structure differs very much from that of the properly developed seed; the qualities are not less different, almost one half of the whole substance consists of *fungin;* and the cells contain, instead of starch, globules of a peculiar fixed oil—Oil of Ergot, to which the remarkable qualities of E. are supposed to be chiefly or entirely due. Oil of E. forms about 35 per cent of the E. of rye. E. appears to have been first observed in rye, in which it becomes very conspicuous from the large size it attains, sometimes an inch or even an inch and a half in length. It is, however, not uncommon in wheat and barley, although in them it is not so conspicuous, from its general resemblance to the ordinary ripened grain. Rye-grass is often affected with E., as are many other grasses; and it is of frequent occurrence in maize, in which also it attains its greatest size. E. has been supposed to be merely a

disease occasioned by wet seasons or other climatic causes. But it appears now to be fully ascertained that it is a disease occasioned by the presence of the *mycelium* of a fungus; the spores of which may perhaps be carried to the flower through the juices of the plant, for there is reason to think that E. in a field of grain may be produced by infected seed. Mr. Quekett, in 1838, described a fungus, a kind of mold (q.v.), which he found in E., and to which he gave the name of *ergotætia abortifaciens*. Link and Berkeley afterwards referred it to the genus *oidium;* and they, as well as others, believed it to be the true E. fungus. The spores of this E. mold, however, vegetate readily, under proper conditions of warmth and moisture, in situations very different from that in which E. is produced; and its presence is perhaps a consequence rather than the cause of ergot. The true E. fungus seems to have been discovered by Tulasne, who published a description of it in 1853. That of the E. of rye is called *cordiceps* (or *claviceps*) *purpurea;* its mycelium alone exists in E., but if the ergoted grains are sown, the fungus develops itself in its perfect form, growing in little tufts from the surface of the E., with stem about half an inch long, and subglobular head. Allied species appear to produce the E. of other grasses.

E. is inflammable; the fixed oil which it contains, indeed, makes it burn readily if brought into contact with the flame of a candle. It is a valuable medicine, exercising a specific action on the womb, particularly during labor, and by the greater frequency and force of the contractions which it causes when cautiously administered, often most beneficially hastening delivery. Its employment for this purpose is said to have originated—in consequence, probably, of an accidental discovery—with a provincial female practitioner in France. Its introduction into British practice dates only from 1824. It is the E. of rye which is always employed; also called SPURRED RYE, or *secale cornutum*. It has been employed also as a sedative of the circulation, to check various kinds of hemorrhage. E. is administered in various forms—powder, decoction, extract, tincture, oil of E., etc.—In large or frequent doses, E. is a poison, sometimes producing convulsions, followed by death; sometimes gangrene of the extremities, resulting in mutilation or in death.

E. of rye consists of 35 per cent of a peculiar fixed oil, 1¼ of ergotin, 46 of fungin, the remainder being gum, fat, albumen, salts, etc. E. burns with a yellow-white flame, and treated with water, yields a reddish colored liquid, with acid properties. In considerable quantities, it is a poison to the lower animals as well as to man.

ERGOTISM, the constitutional effect of ergot of rye (q.v.). See also RAPHANIA.

ERIC is the Scandinavian form of the name Henricus, Enrico, and Henry of southern nations. Many kings of the name reigned separately in Denmark and Sweden, and some ruled over the whole of Scandinavia after the union of Calmar. The memory of the two earliest rulers of the name in Denmark merits our notice from their association with the introduction of Christianity. Eric I., who died in 860, protected the Christians in the latter part of his reign, and, under the direction of the missionary Angsar or Anscharius, founded the cathedral of Ribe, the first Christian church in the land. In his time, the Northmen began those incursions into more southern countries, which were destined to exercise so permanent an influence on European history. Eric II. followed in the steps of his father, and permitted Ansgar to prosecute the labor of converting and civilizing the people, which won for him the title of the tutelar saint of the north. To Eric II. is ascribed the reorganization of those guilds which finally merged in the municipal corporations of the middle ages, but which were, at first, a mere modification of the heathen brotherhoods of the Scandinavian heroic ages, and constituted associations, whose members were a privileged class, separated by distinct laws, rights, and duties from the rest of the people. Denmark suffered in the 12th c. in an equal degree from the two Erics who ruled over her, for while Eric, surnamed Emun, exhausted the strength of the land by the indomitable pertinacity with which he endeavored, by force of arms, to compel the Vandals and other piratical neighbors to accept the Christianity which he thrust upon them, Eric "the Lamb" crippled the powers and resources of the crown by his pusillanimous subserviency to the clergy. The three Erics (Eric VI., VII., and VIII.) who occupied the throne, with only the intermission of a few years, from 1241 to 1319, are associated with one of the most disastrous periods of Danish history. Long minorities, the suicidal practice of dismembering the crown-lands in favor of younger branches of the royal house, and futile attempts to restrain the ever-increasing encroachments of the church, combined to bring the country to the brink of destruction. Eric VI. (Plogpenning) and Eric VII. (Glipping) were both assassinated, the former at the instigation of a brother, and the latter in revenge for a private injury. Eric VIII., the last of the name before the union of Calmar, died childless, and was succeeded, in 1319, by his ambitious brother Christopher, who saw himself compelled to repay his partisans at the expense of almost all the prerogatives and appanages which still belonged to the crown.

In Sweden, the first of the name who merits our notice is king Eric, surnamed the Saint, who was slain in battle in 1131, after a short reign, which was signalized, in that age of anarchy, by the foundation of many churches and monasteries, and by the promulgation of an excellent code of laws, known as *St. Eric's Lag*. This law contained provisions by which a higher status in society was secured to women, by granting

them a fixed proportion of the heritage of their male relatives, and certain definite privileges within their households. St. Eric waged frequent war with the Finns, and compelled them to adopt the outward forms of Christianity. The two namesakes and descendants of St. Eric, who ruled in Sweden during the 13th c., and Eric XII., who reigned from 1350 to 1359, have little claim to our notice, for internal disturbances and wars with their neighbors brought about the same fatal results as those which are associated with the reigns of the Erics in Denmark during the middle ages. In 1412, on the death of the great Margaret, her relative, Eric of Pomerania, succeeded to the triple crown of Scandinavia, in accordance with the articles of the famous treaty of Calmar. The noble heritage that had been bequeathed to Eric required a firmer hand and a braver spirit than his to keep it in check; and his reckless disregard of treaties and oaths, his neglect of his duties, and his misdirected ambition, led, after years of dissensions, maladministration, and disaffection, to the inevitable result that Eric was declared to have forfeited the respective thrones of the several kingdoms, which proceeded to elect rulers of their own. The intestine wars to which this condition of things gave rise, plunged the whole of Scandinavia into anarchy, and sowed seeds of dissension among the three kindred nations, which bore fatal fruits in subsequent ages. The last ten years of Eric's life were spent in the exercise of piracy in the island of Gothland, whither he had retired with his mistress and a band of followers, and from whence he sent forth piratical expeditions to pillage both friends and foes. Eric married Philippa, daughter of Henry IV. of England, whose memory is still cherished in the north, on account of the many noble deeds with which local tradition associates her name. Eric XIV., the last of the name who reigned in Sweden, had the distinction of being at once one of the worst and one of the most unhappy of the name. He succeeded, in 1560, to the throne of his father, Gustaf Vasa, who was perhaps the greatest and worthiest monarch that ever reigned over Sweden, and immediately on his accession, he made known the difference that was so unfavorably to distinguish his reign from that of his father, by quarrelling with his brothers, thwarting the nobles, and opposing the lower orders. His fickleness and extravagance were displayed in a succession of embassies, which were in turn sent to almost every European court to demand a consort for this vacillating monarch, who usually changed his mind before his envoys had time to fulfill their missions. Elizabeth of England and Mary of Scotland were more than once the objects of his matrimonial schemes; but when the resources of the country had been seriously crippled by these costly and absurd expeditions, Eric married a Swedish peasant-girl, who ultimately acquired an influence over him which was ascribed by the superstitious to witchcraft, since she alone was able to control him in the violent paroxysms of blind fury to which he was subject. It is probable that Eric labored under remittent attacks of insanity, and that to this cause may be attributed the bloodthirsty cruelty with which he persecuted those of his own relatives or attendants who fell under his suspicion. His capricious cruelties at length alienated the minds of his subjects, who, wearied with the continuous wars and disturbances in which his evil passions involved them, threw off their allegiance in 1568, and solemnly elected his brother John to the throne. For nine years, the unhappy Eric suffered every indignity at the hands of the keepers appointed by his brother to guard him, and in 1577, he was compelled to terminate his miserable existence by swallowing poison, in obedience to his brother's orders. Singular to say, this half madman was a person of cultivated understanding, and he solaced his captivity with music and the composition of psalms, and in keeping a voluminous journal.

ERIC THE RED, a native of Norway, b. about 950 A.D. He fled from Norway to escape punishment for homicide, and settled on the w. coast of Iceland. Another homicide compelled his flight from that country, and in 984 he went to Greenland, which had been discovered by Gunnbjörn 100 years before, but not settled. He gave the strange land its incongruous name to attract settlers, and became the leading man in the colony, calling the chief town Gardar. The settlements flourished for about four centuries, when they suddenly disappeared from history, and were remembered only as "the lost colonies of Greenland." It is supposed that the entire people were carried off by the plague known as the "black death," in the latter part of the 14th century. Eric is erroneously set down in some books as the discoverer of the American continent. It was his son Leif Ericsson who first landed on the continent somewhere in New England in the year 1000, and he had been preceded by Bjarne Herulfsen, who sailed along Labrador and Newfoundland in the year 986, but did not land.

ERI'CEÆ, or ERICA'CEÆ, a natural order of exogenous plants, consisting chiefly of small shrubs, but containing also some trees. The leaves are opposite or in whorls, entire, destitute of stipules, often small, generally evergreen and rigid. The flowers are sometimes solitary in the axils of the leaves, sometimes grouped in different modes of inflorescence, and are often of great beauty, in which respect no order of plants excels this; the beauty of the smallest species, and of those which have very small flowers, rivaling that of others which are trees profusely covered with magnificent clusters. About 900 species of this order are known, of which the greater number are natives of South Africa, which particularly abounds in the genus *erica*, and its allies—the true heaths (q.v.)—although some of them are also found to the utmost limits of northern vegetation. They are rare within the tropics, and only occur at considerable

elevations. Few species are found in Australia. Many of the E. are *social* plants, and a single species sometimes covers great tracts, constituting their principal vegetation. This is most strikingly exemplified in the heaths of Europe and the north of Asia. Medicinal properties exist in some of the E., as the BEARBERRY (see ARBUTUS), and the GROUND LAUREL of North America (*epigæa repens*), a popular remedy in the United States for affections of the bowels and urinary organs. Narcotic and poisonous qualities are of not unfrequent occurrence. See ANDROMEDA, AZALEA, KALMIA, LEDUM, RHODODENDRON. The berries of some species are edible (see ARBUTUS and GAULTHERIA), although none are much esteemed.—The RHODODENDREÆ have sometimes been regarded as a distinct order, but are generally considered a suborder of E., containing the genera *rhododendron*, *azalea*, *kalmia*, *ledum*, etc. The larger leaves and flowers, and generally also the larger plants of the order, belong to this suborder; which, however, contains also many small shrubs of subarctic and elevated mountainous regions.

ERICHT, or **ERROCHT**, LOCH, lies in the n.w. of Perthshire and s. of Inverness-shire, in an uninhabited district, the wildest and most inaccessible in Scotland, amid the Grampian mountains. Its banks rise steeply from the water's edge. It is 14 m. long and nearly 1 m. broad, and it extends in a s.w. direction from near Dalwhinnie on the Dunkeld and Inverness road. By one outlet it joins Loch Rannoch, and by another it runs into Loch Lydoch, its waters ultimately reaching the Tay. Its surface is about 1500 ft. above the sea, and it never freezes. In a cave at the s. end of the loch, prince Charles lay hid in 1746.

ERICSSON, JOHN, a distinguished engineer, was b. in Sweden in 1803. After serving for some time as an officer of engineers in the Swedish army, he removed in 1826 to England, and continued to occupy himself with improvements chiefly on steam machinery and its applications. It is to E. that steam navigation owes the screw-propeller (q.v.). In 1839, he went to New York, United States, where he brought out his improved caloric engine (q.v.), a hydrostatic gauge, a pyrometer, a new sea-lead, and other mechanical novelties. He constructed the iron-clad *Monitor* (see TURRET-SHIP), and other vessels for the American navy.

ERICSSON, JOHN (*ante*), 1803; b. in Sweden, where he became a distinguished engineer. He came to New York in 1839, and two years afterwards was employed on the war-steamer *Princeton* (the first war-steamer having its propelling machinery below the water-line), his own invention of the screw-propeller being used. E. soon became known for the great number and novelty of his inventions, some of which were a steam-boiler with artificial draught, which did away with smoke-stacks and effected an important saving in fuel (this invention was at once applied to railway locomotives); a steam fire-engine; the caloric engine; the screw propeller for steam navigation; a sliding telescopic chimney; machinery to check the recoil of heavy guns; an instrument for measuring distances at sea; the hydrostatic gauge for measuring the volume of fluids under pressure; a meter to measure the amount of water passing through pipes; an alarm barometer; a pyrometer to measure temperature from the freezing of water to the melting of iron; a lead to take soundings without rounding the vessel to the wind; and various modifications of his caloric engine. In the war of the rebellion he was engaged in building "monitors" (so called from the name of the first one), iron ships with revolving iron turrets for the guns. The first one was built in a little more than three months, and, Mar. 9, 1862, defeated and destroyed the confederate iron-clad *Merrimac*. Of late years he has been trying to perfect the solar engine, for which heat is obtained from the rays of the sun collected by a huge funnel lined with reflecting surface.

ERIE, one of the five great lakes which empty themselves by the St. Lawrence, separates Upper Canada on its left from Michigan, Ohio, Pennsylvania, and New York on its right. It is the most southern of the five, receiving at its south-western extremity the waters of lakes Superior, Michigan, and Huron by the river Detroit, and discharging them at its n.e. by the Niagara into lake Ontario. With a length of 240 m., E. has a breadth varying from 30 to nearly 60 m., with an area of 9,600 sq. miles. It is 16 ft. below the Huron, and 333 and 565 respectively above the Ontario and the Atlantic. At its south-western extremity are several wooded and partly cultivated islands, the largest of which is about 14 m. in circumference. It is by far the shallowest of the five great lakes. Its mean depth is stated at 120 ft.; and from this comparative shallowness and the consequent liability to a heavy ground-swell, as well as on account of the small number of good harbors, the navigation is peculiarly difficult and dangerous. The chief harbors on the s., or United States shore, besides the natural harbor of E. itself or Presque isle, are those of Cleveland, Sandusky City, and Toledo; and on the n. or Canadian shore, ports Dover, Burwell, and Stanley. Lake E. receives no rivers of any consequence. Its commercial importance, however, has been largely increased by art. It is connected by one canal with the Hudson, and by more than one with the Ohio; while, on the British side, it communicates with the Ontario by means of a still more available work, the ship-channel of the Welland. Its navigation generally closes in the beginning of Dec., and the lake remains more or less frozen till Mar. or April. The commercial importance of this lake has been greatly enhanced the last few years by the establishment of numerous lines of railway connecting its ports with the interior. The amount of traffic on the lake and on these railways is enormous. Lake E. was the scene of a

naval engagement between the British and Americans, Sept. 10, 1813, in which the latter were victorious.

ERIE, a co. in w. New York on lake Erie and Niagara river, intersected by the Erie, the New York Central, the Lake Shore, the Buffalo and Jamestown, and the Buffalo, Corry, and Pittsburg railroads, and the Erie canal; 1071 sq.m.; pop. '75, 190,570. The surface is undulating and the soil fertile, producing wheat, corn, oats, and abundant pasturage. There are beds of hydraulic cement, and good limestone. Co. seat, Buffalo.

ERIE, a co. in n. Ohio, on lake Erie, drained by Vermilion and Huron rivers, and crossed by the Lake Shore, the Cincinnati, Sandusky, and Cleveland, and the Sandusky, Mansfield, and Newark railroads; 260 sq.m.; pop. '70, 28,188. It is mostly level, producing wheat, corn, barley, butter, wool, wine, etc. Co. seat, Sandusky.

ERIE, a co. in n.w. Pennsylvania, on lake Erie between New York and Ohio; traversed by the Lake Shore, the Philadelphia and Erie, and the Erie and Pittsburg railroads; 740 sq.m.; pop. '70, 65,973. With the exception of a ridge running parallel with the lake the surface is generally level. The productions are corn, wheat, oats, butter, lumber, etc. Co. seat, Erie.

ERIE, a port on the lake of its own name in the state of Pennsylvania, stands in lat. 42° 8′ n., and long. 80° 10′ west. Its harbor, one of the largest and best on the coast, is formed by an island of 4 m. in length, which, under the appellation of Presque isle, still preserves the memory of its having been a peninsula. The belt of water, which is thus sheltered, is known as Presque isle bay, and forms a natural harbor for the city. It is now protected by a breakwater. It is 3½ m. long, and 1 m. wide, and varies in depth from 9 to 25 feet. While much has been done to improve the natural advantages of its position, E. has been connected by means of a canal with the Beaver, a feeder of the Ohio; and this work, independently of its navigable facilities, affords extensive water-power to mills of different kinds. It is the terminus of the Philadelphia and Erie railway, and is by other lines connected with New York, Cleveland, etc. This port is destined to become an important center of trade. Pop. '70, 19,646.

ERIE (*ante*), a city in Pennsylvania, on lake Erie, nearly midway between Buffalo and Cleveland. The town was laid out in 1795, was incorporated as a borough in 1805, and in 1851 chartered as a city. It is the seat of justice for Erie county. It has had a rapid increase of population—from 3,412 in 1840 to 19,646 in 1870. It stands upon an elevated bluff overlooking the lake; the streets are broad, intersecting each other at right angles; there are several parks, and the harbor is one of the best on the lake. Erie is connected by railroad with Buffalo on the e., Philadelphia on the s., and Cleveland, Detroit, etc., on the west. The manufactures of the place include steam-engines, stoves, machinery, car-wheels, bricks, leather, petroleum-refining, organs, pumps, furniture, brass-works, and brewing. The extensive coastwise trade is carried on partly by steamers and partly by sailing vessels. The harbor, protected by the island of Presque Isle and by a breakwater, has a depth of from 9 to 25 ft.; and the docks are provided with every facility for the transfer of merchandise to and from the railroads. The principal articles of shipment are lumber, coal, iron ore, and petroleum. There are several national banks, with an aggregate capital of nearly $1,000,000. The Union railway depot is a fine building, 400 ft. in length by 88 ft. in width. The schools are well organized, and there are 30 churches of different denominations. The fleet with which Perry defeated the British in the naval battle in Put-in bay, in the war of 1812–15, was built and equipped here.

ERIE, BATTLE OF LAKE, a naval engagement in the war of 1812 between Great Britain and the United States, fought in Put-in bay, near the western end of lake Erie, Sept. 10, 1813. The American fleet, which had been built at Erie, ran the British blockade on the 12th of August, and sailed west. It consisted of 9 vessels, with 54 guns and 490 officers and men. The British had 6 vessels, mounting in all 63 guns, with 502 officers and men. Only 2 vessels of the American squadron were in the proper sense vessels of war, the others having been built for trade. The American guns, though of heavier caliber, were of shorter range than those of the British; but the American fleet had an advantage in the better quality of its seamen. The American commandant was lieut. Oliver Hazard Perry. At the opening of the battle Perry's flag-ship *Lawrence* was disabled, but he left her in command of lieut. Yarnall and shifted his flag to the *Niagara* under a heavy fire. The remainder of the fleet now joined in the attack upon the enemy, compelling the almost immediate surrender of the British flag-ship *Detroit* and three other vessels. The remaining two attempted to escape, but were overtaken and captured. Perry at once sent a dispatch to gen. Harrison, saying, "We have met the enemy, and they are ours—two ships, two brigs, one schooner, and one sloop." The battle lasted 3 hours, and about 13 men were killed and wounded on each side. The American supremacy on the lakes being established, Detroit was evacuated by the British, and peace established in Michigan. Gold medals were conferred by congress upon Perry and Elliott, the leaders in the battle, and minor rewards upon the other officers and men. In 1858, on the anniversary of the battle, the remains of the officers killed were buried on Put-in bay island, where a monument has been erected to their memory.

ERIE CANAL, connecting the Hudson river at Albany and Troy with lake Erie at Buffalo, is 363 m. in length. It was begun in 1817, and completed in 1825, at a cost of $7,602,000. Its construction is due chiefly to the foresight and energy of De Witt Clinton, and while it was in progress it was often ridiculed by self-complacent skeptics as "Clinton's big ditch." The enterprise was undertaken and carried through by the state of New York, Clinton being governor during nearly all the period of its progress. As its route lay chiefly through an uninhabited wilderness, it opened for settlement an immense territory. It was subsequently enlarged, and is now 70 ft. broad at the surface, and 56 ft. at the bottom, with a depth of 7 feet. The locks, 72 in number, 57 of which are double, and 15 single, are 110 ft. long and 18 ft. wide. It is carried by great stone aqueducts across several large streams, and in some places it is cut through solid rock. It is supplied with water from lake Erie, 142 m. from Buffalo to Seneca river. Most of the flow of water is from the w. towards the e., the only exception being between Lodi and the Seneca river, where there is a fall westward through 5 locks. At Rome, a little w. of Utica, a supply of water is received from the Black river canal. Between Rome and Syracuse water is drawn from Cazenovia lake and other reservoirs, while at Syracuse it supplies water to the Oswego canal. Buffalo is 568 ft. above the level of the Hudson at Albany, the difference being overcome by locks at various points. The canal has been immensely successful, contributing largely to the growth of New York, Buffalo, and intermediate places. The railroads, though affording means of more rapid communication, and having the advantage of being open at times when the canal is frozen, have by no means superseded the latter.

ERIES, an Indian tribe of the same family as the Hurons and the Iroquois, or Six Nations, once dwelling in the neighborhood of Niagara falls, but forced inland by hostile tribes. About 1653, they were attacked by the Iroquois, and in 1656, nearly exterminated. Those who remained of the tribe became incorporated with the Senecas.

ERIE SHALE, a name given to the extension w. of the Upper Portage and Chemung rocks of New York. It overlies the Huron shale, the latter being the storehouse of petroleum.

ERIG'ENA, JOANNES SCOTUS, a famous philosopher of the middle ages, was b. probably in Ireland, and flourished during the 9th century. Very little is known regarding his history. He appears to have resided principally in France, at the court of Charles the bald. In the controversies of his time, regarding predestination and transubstantiation, he took part. His philosophic opinions were those of a Neo-Platonist rather than of a scholastic. His love for the mystic doctrines of the old Alexandrian philosophers was shown by his translation of the writings ascribed to Dionysius the Areopagite, which proved to be a wellspring of mysticism during the middle ages. E. held that God is the essential ground of all things, from whom all things emanate, and into whom they return again. Pantheism, therefore, lurks in his system. His principal work is *De Divisione Naturæ* (published by Gale, Oxford, 1681). One of its leading thoughts is the identity of philosophy and religion, when both are probably apprehended. E. uttered his opinions with great boldness, and he exhibited no less subtlety and strength of intellect in their defense. He expressed his contempt for theological dogmatism, and vindicated the authority of reason over all other authority. His words are: "Authority is derived from reason, and not reason from authority; and when the former is not confirmed by the latter, it possesses no value." Consult Hjort's *Joh. E.* (Copenh. 1823); Staudenmayer, *Joh. E.* (Frankfort, 1834); and Taillandier, *Scot. E. et la Philosophie Scholastique* (Strasb. 1843); Möller, *Scotus E.* (1844); Christlieb, *Leben und Lehre des Scotus E.* (1861); and Huber, *Johannes E.* (1861).

ERIG'ERON, a genus of plants of the natural order *compositæ*, sub-order *corymbiferæ*, having heads (flowers) of many florets, the florets of the ray numerous, in several rows, of a different color from those of the disk. Two or three species are natives of Britain, the most common of which, *E. acris*, has a stem 16 to 18 in. high, narrow entire leaves, flower-stalks forming a kind of corymb, flowers with yellow disk and pale-blue ray. It has a powerful odor, which is said to keep away fleas, and the name FLEA-BANE is sometimes given to the plant. Its ashes contain about 5 per cent of potash, for the sake of which it is sometimes collected and burned. *E. Philadelphicum*, a native of North America, with pale-purple ray, and a fetid smell, is valued in the United States as a diuretic.

ERINA'CEUS and ERINACE'ADÆ. See HEDGEHOG.

ERINNA, a Greek poetess, concerning the date of whose birth the most different statements are advanced. According to some, she was the intimate friend of Sappho (hence she is likewise called the Lesbian singer), and was born at Rhodes, or on the little island of Telos, situated w. of Rhodes; while others maintain that she lived in the age of Demosthenes; and others again, perplexed by such a wide difference in point of time, have recourse to the hypothesis of two poetesses of this name. E. acquired such celebrity by her epic, epigrammatic, and lyric poems, that her verses were compared with those of Homer, although she died at the early age of 19. The genuineness of the fragments that still exist under her name, has been disputed on good grounds. These

have been collected by Schneidewin in the *Delectus Poesis Graecæ Elegiacæ* (Göttingen, 1838). Compare Malzow, *De Erinnæ Lesbiæ vita et Reliquiis* (Petersburg, 1836).

ERIN'YES. See EUMENIDES, *ante*.

ERIOBO'TRYA. See LOQUAT.

ERIOCAULA'CEÆ, a natural order of endogenous plants, nearly allied to *restiaceæ*, and containing about 200 known species, many of which are aquatic or marsh plants. The E. are chiefly natives of the tropical parts of America and Australia. One species, *eriocaulon septangulare*, JOINTED PIPEWORT, is found in the w. of Ireland, and in some of the Hebrides; a little grass-like plant, growing in lakes which have a muddy bottom, and exhibiting small globular heads of flowers. From its botanical affinities, and with reference to geographical distribution, no British plant is more interesting. The E. form a remarkable feature of the vegetation of some parts of South America; but many of the species bear little resemblance to their humble northern congener, being almost shrubby, 4 to 6 ft. high, with leafy, much-branched stems, "each branchlet terminated by a large white ball, composed of a vast number of smaller heads, placed on peduncles of unequal length" Many of them also grow on arid mountainous regions, others in flat sandy grounds, which are flooded in the wet season.—Gardner's *Travels in Brazil*.

ERIODEN'DRON, a genus of trees of the natural order *sterculiaceæ*, natives of tropical countries, the thick woody capsules of which contain a kind of wool surrounding the seeds. These trees are therefore sometimes called WOOL-TREES. The wool of *E. samanna* is used in Brazil for stuffing pillows. *E. anfractuosum*, of which one variety, found in the East Indies, is sometimes called *E. Indicum*, and another, found in Africa, *E. guineense*, is a tree of great height, 150 ft. or more. The African variety or species is called RIMI and BENTANG. Park mentions it by the latter name. Barth says it is generally to be seen growing near the principal gate of large towns in Hansa. Its wood is soft and spongy, chiefly used for making canoes. The seeds of *E. Indicum* are eaten in Celebes. They are roundish, and of the size of peas. The trees of this genus have palmate leaves. The flowers are large and beautiful.

ERIS, in Greek mythology, sister of Mars, daughter of Nyx (night), and sister of Nemesis. Eris, or "strife," is represented at first as insignificant, but growing until her head touches the heavens. It was Eris who at the marriage festival of Peleus and Thetis flung on the table the golden apple inscribed to the fairest of the fair, for which Juno, Venus, and Minerva contended. Virgil gives Eris the name of Discordia.

ERIVAN', or IRWAN, a government of Russia on the borders of Persia, Georgia, and Armenia; 10,670 sq.m.; pop. 452,001. The largest river is the Aras, or Araxes, and Ararat is the principal mountain. There are valuable mines of gold and other minerals, and salt is produced in large quantities. Chief town, Erivan.

ERIWAN' (Persian, *Rewán*), the fortified capital of Russian Armenia, situated to the north of Ararat, in the elevated plain of Aras or Araxes, lat 40° 10' n., long. 44° 32' e., 3,312 ft. above the level of the sea. It consists of the town, properly so called, and the fortress, which is surrounded on three sides by high walls, and provided with aqueducts; a stone bridge over the Zenga, which here falls into the Araxes; a barracks, three mosques, one of which has been converted into a Russian church, the palace of the sardar, and a bazaar. Pop. '67, 14,342, who are engaged in agriculture and commerce. E. was formerly the capital of the Persian province of Aran, celebrated for its silk. In the beginning of the 16th c., the khan Rewan, at the command of Ismael, the shah of Persia, erected a strong fortress, which he called after his own name. An Armenian school was established at E. in 1629, but transferred to Ejmiadzin in 1631. During the last war between Russia and Persia, E. was stormed by the Russian gen., Paskewitsch, who received the surname of Eriwanski; and by the treaty of peace concluded at Turkmanjai, 22d Feb., 1828, it was given up by Persia to Russia, along with the province of the same name. It is now an important Russian post, as in former times it formed the bulwark of Persia against the Turks, and afterwards against Russia. In the year 1840, it was much devastated by an earthquake.

ER'LANGEN, a t. of Bavaria, is situated in the midst of a well cultivated district, on the right bank of the Regnitz, 10 m. n. of Nürnburg. It is a handsome town, and is surrounded by walls pierced by seven gates; its streets—a great number of which were erected after the year 1706, when a fire consumed a large portion of the town—are straight and regular. It is divided into the old and new towns, the latter founded in 1686 by Christian, markgraf of Bayreuth. E. is the seat of a university, of a gymnasium, of agricultural and industrial schools, and other institutions. The university, however, is the chief building. It was founded in 1742, and is celebrated as a school of Protestant theology, is attended by between 400 and 500 students, has a library containing 140,000 vols. and 1000 manuscripts, and also zoological and mineralogical collections, etc. E. owes its prosperity to the migration thither of a number of refugees from France, who were compelled to flee on the revocation of the edict of Nantes, and who introduced many new branches of manufacture at Erlangen. Besides its extensive stocking and glove manufactories, which provide the greater part of Germany with their goods, E. has great mirror and tobacco factories, and manufactures of combs

and horn-ware. E. became a Bavarian possession by the treaty of 1809. Pop. '75, 13,597.

ERLAU (Hung. *Eger*), an episcopal city of Hungary, in the co. of Heves, of which it is capital, is situated on both banks of the river Erlau, in a delightful valley skirted with vine-clad hills. It is surrounded by old walls, pierced by six gates; has four suburbs, in which the greater portion of the inhabitants dwell; and although in general its streets are narrow and have a neglected appearance, it is rich in fine public buildings. The principal of these are the lyceum, with a valuable library, and an observatory 172 ft. high; the recently built cathedral, the episcopal palace, the Franciscan and the Minorite monasteries, a richly embellished Greek church, a county hall, and the new barracks. E. has also a gymnasium, an episcopal seminary, a normal and drawing school, a hospital founded in 1730, which possesses a capital of nearly 400,000 guilders, and other important institutions. The two baths, the *Turkenbad* and the *Bischofsbad*, both of which are much resorted to during the bathing-season, are supplied from two warm springs which rise from the bank of the Erlau. The cultivation of the vine is the principal occupation of the inhabitants. The E. wine, the best red wine of Hungary, is produced in considerable quantities, and is in request even in foreign countries. There are also manufactures of linens, woolens, hats, etc., and an important weekly market, which has a beneficial effect upon the industry of the town. Pop. '69, 19,150, most of whom are Roman Catholic in religion, and Magyar in race. E. owes its importance to the very old bishopric founded here by St. Stephen in the beginning of the 11th c., and which, in 1804, was raised to an archbishopric.

ERLKÖNIG, in German, is the name applied to a poetical, personified, natural power which, according to German poetical authorities, prepares mischief and ruin for men, and especially for children, through delusive seductions. The name, not connected with the root *erle*, is synonymous with Elfen König. The E. was introduced into German poetry from the Sagas of the north, through Herder's translation of the *Erlkönig's Daughter* from the Danish, and has become universally known through Goethe's ballad of the *Erlkönig*.

ERMAN, GEORG ADOLPH, son of Paul; b. Germany, 1806. In 1828–30, he traveled around the world chiefly to make observations in magnetism, and published an account of his journey, from which the portion describing Siberia was translated into English. He has published other works on plants and animals, and since 1841 has been principal editor of a scientific publication chiefly concerning Russia. He has been for a number of years professor of physical science in the university of Berlin.

ERMAN, PAUL, 1764–1851; b. Berlin. At first intending to study for ordination in the church, he turned to pursue physical sciences and became a teacher in the French gymnasium in Berlin, and later in the military academy. When the university of Berlin was founded he was chosen professor of physics, and held the office until his death. He made important discoveries in electricity, magnetism, optics, and physiology, and wrote valuable works on these subjects.

ER'MELAND, an old division of Poland, now in the province of Konigsberg, Prussia; 1600 sq.m.; pop. about 200,000. It is a Roman Catholic diocese, with a see at Frauenburg.

ERMENONVILLE, a village in the s.e. of the department of Oise, in France, in the possession of the Girardin family. It is celebrated for its beautiful and extensive parks, and as being the resting-place of Rousseau, for which reason it is much visited in summer by strangers from Paris. It was also the residence of Gabrielle d'Estrées, the mistress of Henry IV., who inhabited a hunting-tower, part of which is still standing, and bears her name. It became still more celebrated after the death of Rousseau in 1778. During the revolution, his ashes were removed to the Pantheon, but conveyed back to E. after the restoration. It had nearly been purchased by the *Bande Noire*, but a larger sum was offered by Stanislaus de Girardin, the well-known liberal deputy, and E. was preserved for the lovers of art, of nature, and of historical monuments.

ERMINE, white fur, with black spots; the reverse of which, or a black fur with white spots, also used in heraldry, is called *contre ermine*. E. is commonly used to difference the arms of any member of a family who is connected with the law. A cross composed of four E. spots is said to be a cross ermine.

ERMINE, or STOAT, *Mustela erminea*, a species of weasel (q.v.), considerably larger than the common weasel, but much resembling it in general form and other characters, as well as in habits. The E. is almost 10 in. in length, exclusive of the tail, which is fully 4½ in. long. It is of a pale reddish-brown color in summer, the under parts yellowish-white, the tip of the tail black; in winter—in cold countries or severe seasons—the upper parts change to a yellowish-white or almost pure white, the tip of the tail, however, *always* remaining black. This change takes place more frequently in the northern than in the southern parts of Britain, but sometimes even in the s. of England; and when it is only partially accomplished, the animal presents a piebald appearance, and very often remains so during the milder winters of Britain. It is in its winter dress that it is called E., and yields a highly valued fur; more valuable, however, when obtained from the coldest northern regions than from more southern and temperate

countries. In its summer dress it is called stoat. It displays indomitable perseverance in the pursuit of its prey, which consists very much of rats, watervoles, and other such small quadrupeds; with young hares and rabbits, grouse, partridges, etc. The eggs of birds are as welcome to it as the birds themselves. The E. is a native of all the northern parts of the world. Its range extends even to the s. of Europe. It delights in moorish districts, and is tolerably abundant in the n. of Scotland. It is from Norway, Lapland, Siberia, and the Hudson's bay territories that the E. skins of commerce are obtained, which are used not only for ladies' winter garments, but for the robes of kings and nobles, and for their crowns and coronets. E. has thus obtained a distinct recognition in heraldry. In making up E. fur, the tails are inserted in a regular manner, so that their rich black shall contrast with the pure white of the rest of the fur.

ERNE, a river and lake in the s.w. of Ulster province, Ireland. The river rises in the s. of Cavan co., in the small but beautiful lough Cowna. It runs n. and n.w., merging in lough Oughter, in Cavan co., and in lough Erne in Fermanagh co., and passes Enniskillen and Ballyshannon. It then flows through the s. corner of Donegal co. into Donegal bay. It has a total course of 72 miles. On the river, at Ballyshannon is a salmon-leap fall, over a rocky ledge 20 ft. high and 150 yards broad, and the river leaps over another rocky ledge near Belleek, 2½ m. below the lower end of the loch. Lough Erne, one of the finest lochs in the kingdom, is the most attractive feature of Fermanagh co., which it bisects lengthways, and almost entirely drains. It extends 40 m. from s.e. to n.w., and consists of two lakes, the upper and lower, joined by a narrower part 10 m. long, and assuming in parts the character of a river, with Enniskillen midway between the two lakes. The upper lough is 12 by 4 m. in extent, 10 to 75 ft. deep, 151 ft. above the sea, and has 90 green hilly islets. The lower lough is 20 by 7½ m. in extent, 100 to 266 ft. deep, 148 ft. above the sea, and has 109 similar islets. On one of the islets is a round tower. They contain salmon, trout, pike, bream, and eels. The scenery around is singularly varied and beautiful.

ERNE, *Haliæëtus*, a genus of birds of the family *falconidæ*, and of the eagle group; differing from the true eagles in the greater length of the bill, in the toes and lower part of the tarsi being destitute of feathers, and generally, also, in frequenting the sea-coast and the banks of lakes and rivers to feed on fish, in feeding like vultures on carrion almost as readily as on newly killed prey, and in inferior courage. The only British species is the COMMON E. (*H. albicilla*), also known as the sea eagle or white-tailed sea eagle. It is much more common in Britain than the golden eagle, is sometimes seen even in the s. of England and in inland districts, occasionally visiting deer-parks to prey on very young fawns or to devour dead deer; but is of more frequent occurrence in the n. of Scotland, doing considerable injury to flocks in Sutherlandshire, particularly during the season of young lambs. Its favorite haunts, where it roosts and makes its nest, are the shelves and ledges of stupendous precipices on the coast, where its scream often mingles with the noise of the perpetual surge. It sometimes also breeds on crags beside inland lakes, as at the lakes of Killarney, and more rarely even on trees. Fishes are certainly its favorite food, although its mode of procuring them is not well known; but water-fowl are also its very frequent prey. It is found in most parts of Europe, and even in the islands of the Mediterranean, but is more abundant in the n. of Europe and in Siberia. It is not known as a native of America. In size, the E. is inferior to the golden eagle, being seldom more than 33 in. in its whole length. The general color of the plumage is brown, the head having a paler yellowish tinge, the tail in the adult bird is pure white. The young, sometimes called the cinereous eagle, has a grayer plumage and mottled tail.—Another notable species of this genus is the WHITE-HEADED E. (*H. leucocephalus*) of America, also called the white-headed eagle, bald eagle, and sea eagle, the chosen symbol of the United States. It is a bird of about the same size with the common E., with dark-brown plumage, and—in an adult state—the head, neck, tail, and belly white. It is found in almost all parts of North America, visiting the arctic regions in summer, but abounding chiefly in the southern states between the Atlantic and the Mississippi. It frequents both the sea-coast and the lakes and rivers, and may be often seen sailing through the column of spray at the falls of Niagara. It is very fond of fish, which it procures by wading in shallow streams, and also by compelling the osprey to relinquish prey just taken. The soaring and evolutions of the birds in the air on such occasions are described as sublime. The white-headed E. feeds also on lambs, fawns, poultry, &c.; kills swans, geese, and other water-fowl; and does not disdain to compel vultures to disgorge for its use the carrion which they have swallowed. On account of its habits and dispositions, Franklin expressed his regret that it had been chosen as the symbol of his country.—More nearly resembling the common E. is another North American species, the BIRD OF WASHINGTON (*H. Washingtonii*).—Australia produces a beautiful species (*H. leucogaster*), and numerous species are found in other parts of the world, amongst which are some of comparatively small size, as the PONDICHERRY KITE or BRAHMANY KITE (*H. ponticerianus*) of India, which is constantly to be seen fishing like a gull in the rivers of that country, and is by the Hindus considered sacred to Vishnu.

ERNST, elector of Saxony, the founder of the Ernestinian line, or the elder branch of the princely house of Saxony, was the elder son of the elector Friedrich the mild,

and of Margaret, archduchess of Austria. When only 14 years of age, he was seized and carried off from the castle of Altenburg, along with his brother Albrecht, but was speedily recaptured. This incident, known in German history as the stealing of the princes (*Prinzenraub*), has been described with extraordinary vividness by Carlyle in the *Westminster Review*, Jan., 1855. He succeeded to the electoral dignity on the death of his father in 1464, but governed in common with his brother for 21 years. In 1485, however, E. and Albrecht divided the paternal possessions, when the former obtained as his share Thuringia, the half of the district then called Osterland, with Voigtland, the Franconian estates of the house, the electoral dignity, and the dukedom of Saxony. E. was a man who took a great interest in the welfare of his people. Against injustice, tyranny, and lawlessness, he was implacable. He died at Kolditz in 1486. It is next to impossible to trace the course of the Ernestinian line through the labyrinthine mazes of the endless German genealogies; it is sufficient to say that after 1638, the Ernestinian line was represented by the dukes of Weimar, who gradually obtained the whole possessions of the house. Johann, duke of Weimar, who died in 1605, left several sons, the eldest of whom, Wilhelm, became the founder of four different branches, all of which, however, were reunited under Ernst August, duke of Weimar, who died in 1748. After 1815, the duchy of Weimar became the grand-duchy of Saxe-Weimar-Eisenach, and its present ruler is of course the direct representative of the Ernestinian line. The other three families by which it is now also represented are those of Meiningen, Saxe-Coburg-Gotha, and Altenburg.

ERNST I., surnamed the pious, duke of Saxe-Gotha and Altenburg, founder of the house of Gotha, was b. at the castle of Altenburg, 24th Dec., 1601. He was the son of that Johann, duke of Weimar, mentioned in the previous article, who died in 1605, and was thus connected with the main Ernestinian line. E. was the ninth of ten brothers, the youngest of whom was the famous Bernhard (q.v.) von Weimar. He received an excellent education from his mother, Dorothea Maria von Anhalt. After the arrival of Gustavus Adolphus in Germany, E. entered the Swedish service, and in various engagements exhibited great courage and skill, completing the victory of the Protestants at Lützen, after the fall of Gustavus. After the battle of Nördlingen, 26th Aug., 1634, E. withdrew from the theater of strife, and for the rest of his life devoted himself to restoring the prosperity of his territories, which had been frightfully devastated during the thirty years' war. He died in 1675. Of his seven sons, the eldest, Friedrich, continued the line of Gotha, while the third became the founder of the house of Meiningen, and the seventh, the founder of the house of Saalfeld. E. is a fine type of the old German Protestant prince. Zealously attached to the doctrines and government of the Lutheran church, he exercised a constant watch over its religious and educational interests. With the formalism, however, that often characterizes "strictly religious" people, he compelled his children to learn the whole Bible by heart. He was much interested in the cause of Christianity abroad, and invited to his court the abbot Gregorius from Abyssinia, besides sending thither on a religious embassy Joh. Mich. Wansleb of Erfurt. He also carried on a correspondence with the king of Ethiopia and the patriarch of Alexandria. His line became extinct by the death of Friedrich IV. in 1825.

ERNST II. (AUGUST KARL JOHANNES LEOPOLD ALEXANDER EDUARD), duke of Saxe-Coburg-Gotha, elder brother of the late prince Albert (q.v.), b. at Coburg 21st June, 1818. Both brothers received an admirable literary and scientific education. The family to which he belongs is a branch of the Ernestinian line, having been founded in 1680 by Albrecht, second son of Ernst the pious (q.v.). When E. had completed a university curriculum at Bonn, he entered the military service of the king of Saxony, but left it on the occasion of his marriage with the daughter of the grand-duke of Baden. In 1844, E. succeeded his father as duke of Saxe-Coburg-Gotha. In his opinions and aspirations, imbued with the spirit of his age, he has introduced into his little dominions many beneficial reforms, and allayed not a few long-standing jealousies. Yet one regrets to say, that his enlightened views of his duty as a ruler have not been generally appreciated by his subjects. During the stormy period of 1848–49, by spontaneous concessions on the one hand, and on the other by an energetic repression of the political anarchists, he contrived to save his territories from the perils of revolution. In the Slesvig-Holstein war, E. took a prominent part, and on the 5th April, 1849, won the battle of Eckenförde. E. was a great advocate for the unity of the German nation, and took a prominent part in most of the efforts made in that direction. His leisure hours are devoted to music and the fine arts. His operas, *Casilda*, *Santa Chiara*, and *Diana von Solanges*, are well known in Germany. In 1861, he published a pamphlet vindicating his government, and, in 1864, an account of a tour in Egypt.

ERNST, HEINRICH WILHELM, an eminent violinist, b. at Brünn, in Moravia, in 1814. He early became a pupil of the Vienna conservatorium, studying under Seyfried and Mayseder. At the age of 16, his talents excited much interest on his appearance in public at Munich, Stuttgart, and Frankfurt; and he soon afterwards performed in Paris. His first visit to London was in 1843; and he returned in subsequent years, spending the intervals in Paris and in different parts of Germany. His playing was characterized by immense brilliancy, combined with passion and sentiment. He suffered much from acute neuralgia, which latterly interfered with the exercise of his art; and the last seven

years of his life were spent at Nice, where he died Oct. 8, 1865. E.'s compositions have generally a bravura character, and include works for the violin and orchestra, quartettes, etc.

ERNEST AUGUSTUS, 1771–1851; fifth son of George III. of England. As duke of Cumberland he was for a long time a member of the house of lords, where he was an extreme tory. When his brother William IV. died, 1837, he became king of Hanover, where he became notorious for tyranny and licentiousness. His blind son George was his successor, reigning until Hanover was annexed to Prussia.

ERNESTI, JOH. AUG., the founder of a new school of theology and philosophy, was b. at Tennstädt, in Thüringia, 4th Aug., 1707. He studied at Pforta, Wittenberg, and Leipsic; but after having been appointed rector of the Thomas school in Leipsic, in 1734, turned his attention chiefly to the old classical literature, and the studies connected with it. In 1742, he became professor extraordinary of ancient literature in the university of Leipsic; in 1756, professor of rhetoric; in 1759, professor of theology; and died 11th Sept., 1781. E. paved the way to theological eminence by a thorough study of philology, and was thus led to a more correct exegesis of the Biblical authors, and to more liberal views of theology in general. In fact, it is mainly to him that we owe the proper method of theological exposition, in so far as it rests upon correct grammatical elucidation. He showed his ability as an accurate critic and grammarian, in his editions of Xenophon's *Memorabilia of Socrates;* the *Clouds* of Aristophanes, *Homer, Callimachus, Polybius, Suetonius,* and *Tacitus;* but above all, by his admirable edition of Cicero (5 vols., Leip. 1737–39), to which he added a *Clavis Ciceronia,* by way of supplement. He was also the first reviver of true and manly eloquence in Germany. His theological writings are numerous. The most remarkable are the *Initia Doctrinæ Solidioris;* the *Institutio Interpretis Novi Testamenti* (translated into English); the *Anti-Muratorius* (1755); and the *Opuscula Theologica* (1792). Compare Bauer, *Formulæ ac disciplinæ Ernestianæ indoles* (1782); Stallbaum, *Die Thomas-schule zu Leipzig* (1839).

ERŌS. See CUPID.

ERO'SION, the influence of a stream or river in hollowing out its channel. Even the smallest streams, when running over soft strata, as clay or sand, cut out channels, and remove the eroded materials. Hollows thus produced have been observed among the stratified rocks. One that occurs in the coalfield of the forest of Dean has been carefully described. The trough was found to branch, when traced in the progress of mining, over a considerable area, and to assume all the appearances of a little stream, with small tributaries falling into it. When the hollows thus abraded are of considerable extent, "*valleys of erosion*" are produced. Many of the earlier geologists held that rivers had hollowed out their own valleys. The immense amount of materials brought down by rivers, and deposited at their mouths as deltas, shows without doubt that they have contributed materially to produce inequalities on the earth's surface; but the examination of the geological structure of valleys, plainly testifies that almost every great hydrographical basin has derived its form originally from some other agency, although its outline may have been subsequently altered by the continued action of currents within it.

EROSTRATUS. See HEROSTRATUS.

EROT'IC (from the Greek *eros,* love), signifying in general whatever is marked by love or passion; but the term is chiefly applied to poetical pieces of which love is the predominating subject.

EROTOMA'NIA, a species of mental alienation caused by love. See MANIA.

ERPENIUS (Latinized from Thomas van Erpen), one of the earliest and most eminent of European orientalists, was b. at Gorkum, in Holland, 7th Sept., 1584. At an early age, he was sent to Leyden, where he directed his attention first to theology, but afterwards more particularly to the study of oriental languages. Having completed his educational course, he traveled through England, France, Italy, and Germany; and in 1613, became professor of oriental languages at Leyden. Here he erected an Arabic press in his own house, caused new types to be cut, and not only wrote but printed a great number of important works bearing on his favorite studies. The professorship of Hebrew not being vacant at the time of E.'s translation to the university of Leyden, a second Hebrew chair was founded expressly for him in 1619. Soon after this he was appointed oriental interpreter to the government, in which capacity he read and wrote replies to all official documents coming from the east. Such was the elegance and purity of his Arabic, as written at this time, that it is said to have excited the admiration of the emperor of Morocco. Towards the close of his life, tempting offers of honors and distinction came pouring in upon him from all parts of Europe; but he was never prevailed upon to leave his native country, where, in the midst of an eminent career, he died 13th Nov., 1624. Although the present standard of oriental knowledge in Europe is much in advance of that of E.'s day, there is no doubt that it was through him principally that eastern, especially Arabic studies have become what they are. With hardly any better material than a few awkwardly printed Arabic alphabets, he contrived to write his famous grammar (*Grammatica Arabica, quinque libris methodice explicata,* Leyden, 1613; recent edition by Michaelis, Gött. 1771), which for 200 years,

till the time of Silvestre de Sacy, enjoyed an undisputed supremacy; and there are many who think his *Rudimenta* unsurpassed, even at the present day, as a work for beginners. Among his other important works the best known is his *Proverbiorum Arabicorum Centuriæ Duæ* (Leyden, 1614).

ERRATA, the list of terrors with their corrections placed at the end of a book. From greater carefulness in correcting the sheets of a work in passing through the press, errors in sense or typography are now much more rare than formerly; in many instances, indeed, books are now produced without a single error which needs to be pointed out and corrected. As an example of one, for "terrors" read "errors" on first line of this article. On this subject interesting particulars are given in Disraeli's *Curiosities of Literature*, of which the following is a specimen: "Besides the ordinary *errata* which happen in printing a work, others have been purposely committed, that the *errata* may contain what is not permitted to appear in the body of the work. Wherever the inquisition had any power, particularly at Rome, it was not allowed to employ the word *fatum*, or *fata*, in any book. An author, desirous of using the latter word, adroitly invented this scheme: he had printed in his book *facta*, and in the *errata* he put, 'for *facta*, read fata.'"

ERRATICS, the name given to the water-worn blocks of stone that have been washed out of the boulder clay, or are still inclosed in it, because they have generally been derived from rocks at a distance. See BOULDERS and BOULDER-CLAY.

ERRHINES (Gr. *en*, in, and *rhin*, the nose), medicines administered locally to produce sneezing and discharge from the nostrils, in catarrh, and in various disorders of the head and eyes. Common snuff, and various other vegetable irritants in powder, have been used for this purpose.

ERROR, PROCEEDINGS IN, the form by which in England the unsuccessful party in an action at law, until the judicature acts of 1875, brought his case for consideration before a court of review. Error may be in fact or in law. If the error were in fact, the case, under the old system, was heard before the court in which the action was originally tried; if the error were in law, proceedings required to be taken before the court of exchequer chamber (q.v.). Where a party disputed the ruling of the judge, form was by bill of exceptions (q.v.) under statute of Westminster the second (13 Ed. I. c. 31). According to the former practice, it was necessary, in order to obtain a review on the ground of error, that an original writ, called a writ of error, should be issued. The writ, if the error was in fact, was styled *coram nobis*, where the case was in the queen's bench, the sovereign being presumed to preside in that court; if in the other courts, the writ was *coram vobis*. Writ of error is abolished by the judicature acts, and so is a bill of exceptions. Since 1875, all appeals are to the court of appeal by way of rehearing, and are brought by notice of motion in a summary way, and no petition or other formal proceeding other than such notice of motion is now necessary. The apellant may by the notice of motion appeal from the whole or part of any judgment, and this does not usually stay proceedings. Nearly all the judgments of the divisional courts of the high court are subject to appeal to the court of appeal and thence to the house of lords. The jurisdiction was transferred to the high court of justice in 1875, which used formerly to be vested in the common pleas at Lancaster and at Durham, and which used to be by writ of error to the queen's bench. Writs of error used formerly also to be brought on judgments of inferior courts. But since the establishment of county courts and the changes introduced by the judicature acts, the analogous proceeding is an appeal by way of a case stated for opinion of the high court, and sometimes by motion in a summary way.

ERROR, WRIT OF, in civil causes. See ERROR, PROCEEDINGS IN. *In criminal causes*, is an original writ from the high court of justice, and is in form addressed to the judges of a superior court, by which they are authorized to examine the record on which judgment was given in the inferior court, and to confirm or reverse the judgment. Writ of error formerly lay for every substantial defect appearing on the face of the record, for which the indictment might have been quashed; but by 7 Geo. IV. c. 64, it was provided that several technical defects should be cured by verdict. By 14 and 15 Vict. c. 100, every formal defect apparent on the face of the indictment must be objected to before the jury is sworn, and not after, and may then be amended. Writ of error now, therefore, lies only for defect in substance appearing on the record, as where a man having been indicted for perjury, it appears that the false statements were not made upon oath. Writ of error is not to be confounded with an appeal on the merits, which is not competent in criminal cases, the verdict being final.

ERRORS. In all observations, E. must be made. The best instruments have imperfections; and no man, however equable his temperament, can always rely on his making a proper use of his senses. As in astronomy numerical correctness in the results of instrumental measurements is of the first consequence, it is the constant care of the observer to detect and make allowance for errors. The three principal sources from which they may arise are—1st, External or incidental causes, such as fluctuations of weather, which disturb the amount of refraction; changes of temperature, affecting the form and position of instruments, etc.; 2d, *E. of observation*, being such as arise from

inexpertness, defective vision, slowness in seizing the exact instant of an occurrence, atmospheric indistinctness, etc.; and such E. as arise from slips in clamping and momentary derangements of the instrument; 3d, Instrumental defects, owing to E. in workmanship, and such as arise from the instrument not being properly placed—called E. of adjustment. The first two classes of E., so far as they cannot be reduced to known laws, vitiate the results of observations to their full extent; but being accidental, they necessarily sometimes diminish and sometimes increase them. Hence, by taking numerous observations under various circumstances, and by taking the *mean* or *average* of the results obtained, these E. may be made to destroy one another to a great extent, and so far may be subdued. With regard to the third class, it is the peculiarity of astronomical observations to be the ultimate means of detection of all defects of workmanship and adjustment in instruments, which by their minuteness elude every other mode of detection. See sir John Herschel's *Outlines of Astronomy*, s. 138 *et seq.* It may be mentioned, however, that the method of subduing E. of the first two classes by the law of average is not applicable in all cases. In certain cases, recourse must be had to what is known as the method of least squares. See SQUARES, METHOD OF LEAST; see also PROBABILITY.

ERSCH, JOHANN SAMUEL, the founder of German bibliography, was b. at Grossglogau, in Lower Silesia, 23d June, 1766; and exhibited from an early period a decided bias towards that branch of literature in which he afterwards obtained so high a reputation. At Halle, where he was sent to study theology in 1785, he devoted himself to historical investigations. After several vicissitudes, he obtained, in 1800, the office of librarian to the university of Jena. Three years later, he was called to Halle as professor of geography and statistics; and in 1808, was appointed, in addition, principal librarian. He died at Halle, 16th Jan., 1828. E. was long engaged in miscellaneous bibliographical work for other scholars; but in 1818, along with Gruber, commenced the publication at Leipsic of the *Allgemeine Encyclopädie der Wissenschaften und Künste* (Universal Encyclopædia of the Sciences and Arts), a work of immense value. By his *Handbuch der Deutschen Literatur seit der Mitte des* 18 *Jahrh. bis auf die Neueste Zeit* (Handbook of German Literature from the Middle of the 18th Century to the most recent Time, 4 vols., 1812–14), he first established modern German bibliography in the technical sense of the word; and by its completeness, accuracy, and mode of arrangement, it is undoubtedly fitted to serve as a model for the imitation of other nations.

ERSE (a corruption of *Irish*), the name given by the lowland people of Scotland to the language spoken by the inhabitants of the western highlands, as being of Irish origin. See BRETTS AND SCOTS. The proper name is Gaelic (q.v.).

ERSEK-UJVAR'. See NEUHAUSEL.

ERSKINE, Rev. EBENEZER, the founder of the secession church in Scotland, was the son of the Rev. Henry Erskine, minister of Chirnside, in Berwickshire, a descendant of the noble family of Mar, and was b. June 22, 1680. He studied at Edinburgh, and after acting for some time as tutor and chaplain in the family of the earl of Rothes, he was licensed to preach the gospel by the presbytery of Kirkcaldy in 1702. His abilities and excellent character soon brought him into notice, and in the following year he was appointed minister of Portmoak in the shire of Kinross. Here he applied himself indefatigably to the study of the Scriptures, and became so deeply convinced that to preach "Christ crucified" was his grand and constant duty as a minister, that after some time the earnestness, unction, and piety which now marked his discourses, became exceedingly attractive to the people accustomed to the chilling "legalism" which then predominated in the Scottish pulpit. E.'s popularity was not confined to the parish of Portmoak; serious Christians from all parts of the country were eager to enjoy occasionally the benefits of his ministry, and on sacramental occasions, he had frequently attendants from the distance of 60 or 70 miles. In 1731, he was translated to Stirling, after having discharged the pastoral office in Portmoak for 28 years. Previous to this event, however, the religious peculiarities of E. had brought him into unpleasant relations with some of his brethren, by the interest which he exhibited in a book called the *Marrow of Modern Divinity*, marked by its strong evangelicalism of doctrine and sentiment. After his transference to Stirling, E. distinguished himself by his advocacy of popular rights in the settlement of ministers; and ultimately involved himself in such antagonism to the church of Scotland, or at least to the ruling party in it of the time, that, along with other three clergymen, he was deposed in 1733. (For an account of the circumstances which led to these depositions, see UNITED PRESBYTERIAN CHURCH). He was shortly after joined by his brother Ralph and several other ministers. They now virtually formed a distinct sect, but they still continued to occupy their parish churches. An effort was made in 1734 to restore them to their legal connection with the church; it was unsuccessful. In 1736, E. and his friends formally seceded, but still it was not till 1740 that they were ejected from their churches. Shortly after this, a furious, and, as it seems to people now-a-days, a contemptible squabble broke out among the seceders in regard to the propriety of taking the burgess-oath. The result was a division of the sect into two bodies, the Burghers and Antiburghers. See

UNITED PRESBYTERIAN CHURCH. E. was the leader of the Burghers. He died June 22, 1756.

ERSKINE, HENRY, 1746–1817: a Scotch lawyer, brother of Thomas, lord Erskine. He was lord advocate of Scotland in 1782 and 1806. In politics he was a whig; but his fame rests chiefly on his wit and tact as an advocate.

ERSKINE, JOHN, of Carnock, and afterwards of Cardross, an eminent Scottish jurist, and professor of Scots law in the university of Edinburgh, was the son of the Hon. John Erskine of Carnock, third son of lord Cardross, whose descendants have now succeeded to the earldom of Buchan. John Erskine, the father, was a man of importance in his day, not only on account of the family to which he belonged, which even then had been prolific in historical characters, but in consequence of his personal qualities and the positions which he held. Having been forced to quit Scotland from his attachment to the Presbyterian religion, he retired to Holland, and became an officer in the service of the prince of Orange. At the revolution, he accompanied William to England, and as a reward for his services, was appointed lieutenant-governor of Stirling castle and lieut.col. of a regiment of foot. John E., the younger, born 1695, became a member of the faculty of advocates in 1719, but did not succeed as a practitioner of the law. On the death of Alexander Bain in 1737, Mr. E. was nominated to succeed him in the chair of Scots law, an office the duties of which he performed with great reputation for 28 years. For many years Mr. E. made use of sir George Mackenzie's (q.v.) *Institutions of the Law of Scotland* as his text-book; but in 1754 he published his well-known *Principles of the Law of Scotland*, which were thenceforth used for that purpose by himself and by his various successors down to the present time. On his retirement from the professorship in 1765, Mr. E. occupied himself in preparing his more important work, *The Institutes of the Laws of Scotland*, but it was not published till 1773, five years after his death. Mr. E. was twice married—first to Miss Melville, of the noble family of Leven and Melville, by whom he left the afterwards celebrated clergyman, John Erskine; and, second, to Ann, second daughter of Stirling of Keir, by whom he had four sons and two daughters. As a legal writer, Mr. E. is inferior to none of our Scottish jurists, with the single exception of lord Stair, who had the benefit of the more learned and wider judicial training of our earlier lawyers, who were educated in a continental school. In consequence of the extent to which lands changed hands in Scotland subsequent to the rebellions, feudal conveyancing became the most prominent subject of study amongst the lawyers of Mr. E.'s day, and the principles of commercial law, of which Stair laid the foundation, and which have become so important in our own time, were somewhat thrown into the shade. The labors of Mr. Bell in these departments have again brought the law of Scotland into connection with the general current of European law and mercantile practice throughout the world. But of all those departments which constitute the law of Scotland, as developed by the usages and forms of society in the country itself, there is at the present day no clearer, sounder, or more trustworthy expositor than Mr. Erskine.

ERSKINE, Rev. Dr. JOHN, son of John Erskine, of Carnock, the author of the *Institutes of the Law of Scotland*, was b. June 2, 1721, studied at the university of Edinburgh, and in 1743 was licensed to preach by the presbytery of Dunblane. In the following year, he was ordained minister of Kirkintilloch, where he remained until 1753, when he was presented to the parish of Culross, in the presbytery of Dunfermline. In 1758, he was translated to New Greyfriars church, Edinburgh; in 1766, the university of Edinburgh conferred on him the honorary degree of doctor of divinity; and in 1767, he was promoted to the collegiate charge of Old Greyfriars, where he had for his colleague Dr. Robertson. In the general assembly of the church of Scotland, he was for many years the leader of the popular or evangelical party; and there the openness and integrity of his character secured him the confidence and affection of his friends, and the esteem and respect of his opponents. Between him and principal Robertson, the leader of the moderate party, there was a courteous and honorable friendship; and the funeral sermon which he preached on the death of his colleague, did equal honor to E.'s head and heart. He died Jan. 19, 1803. E.'s writings are exceedingly numerous. They consist of essays, letters, sermons, dissertations, and pamphlets, etc., mainly of a religious character, and exhibit a superior degree of ability. Sir Walter Scott, in his *Guy Mannering*, gives a graphic and accurate description of his powers as a preacher.

ERSKINE, Rev. RALPH, brother of Ebenezer, was b. at Monilaws, in Northumberland, Mar. 18, 1685, and after completing the usual course of study incumbent on a minister, was ordained to the parish church of Dunfermline in 1711. Sympathizing with the sentiments of his brother Ebenezer, he withdrew from the judicatures of the established church in 1737. In the controversy concerning the burgess-oath, he also took part with his brother. E. died Nov. 6, 1752. His fame rests chiefly on his *Gospel Sonnets* and other religious works, which were once highly popular.

ERSKINE, THOMAS, Lord ERSKINE, was the youngest son of Henry David, tenth earl of Buchan; and was b. in Edinburgh, 10th Jan., 1750. Although his father, at the period of his birth, was reduced to an income of £200 a year, he transmitted to him the blood of a race which had been prolific in men of great ability, and had been ennobled

before the era of genuine history. The countess, who was the daughter of sir James Stewart, of Goodtrees, in the co. of Midlothian, was not only a godly Presbyterian and a skillful housewife, but a gifted and accomplished woman. After E. had attended for some time the high school of Edinburgh, the family removed to St. Andrews, at the grammar school of which place, and subsequently at the university, though never it would seem as a matriculated student, Thomas E. received the rest of such education as fell to his share. His desire was to study for a profession; but his parents, who had sent his eldest brother, lord Cardross, to Leyden, and were educating his second brother, Henry, afterwards the well-known Harry E., for the Scottish bar, could not afford the expense of a third learned education, and sent him to sea as a midshipman. In this capacity he served for four years, until the death of his father, when he purchased a commission in the first royals, and was for some time stationed at Minorca, where he employed his leisure time in the study of English literature. On his return to London, his birth, his acquirements, the elegance of his manners, and volubility of his conversation, led to his being warmly received in the best circles. It was then that he had the controversy with Dr. Johnson on the respective merits of Fielding and Richardson which Boswell has recorded; and that he published a pamphlet on the prevailing abuses in the army, which, though anonymous, was well known to be his, and obtained a great circulation. E. now grew tired of the army as a profession, in which he saw little chance of promotion; and while in this humor, an accidental interview which he had with lord Mansfield at an assize court, determined him to prosecute the study of law. E. was admitted a student of Lincoln's Inn, 26th April, 1775, and on the 13th Jan., 1776, he entered his name on the books of Trinity college, Cambridge, as a gentleman commoner. Many anecdotes are told of the privations which E. underwent when studying for the bar—how he lived on "cow-heel and tripe," dressed so shabbily as to be quite remarkable, and boasted that *out of his own family* he did not know a lord. Such stories, though probably exaggerated, proved that he endured considerable privations—considering his rank—in fitting himself for the legal profession. Lord Campbell says, that "during Easter and Trinity terms he excited a great sensation in the dining-hall by appearing with a student's black gown over the scarlet regimentals of the royals; *probably not having a decent suit of plain clothes to put on.*" Though E. was aided by his aristocratic connection, his rise was still very wonderful. Without the advantage of a business training, or what, probably even in those days, was far more important, a business connection, he rose into practice with almost unprecedented rapidity. After his first speech, the attorneys actually flocked round him with their retainers, and in telling the story, he used sometimes to bring the number which he received before quitting Westminster hall up to sixty-five! His two first clients were officers in the navy—capt. Baillie, who held an office in Greenwich hospital, against whom a rule had been obtained calling upon him to show cause why a criminal information for a libel reflecting on lord Sandwich's conduct as governor of the charity, should not be filed upon him; and admiral Keppel, who was tried by a court-martial at Portsmouth for incapacity and misconduct in an encounter with the French fleet off Ushant; and in both cases E. derived benefit from his own early connection with the service and the special information which he thus possessed. Admiral Keppel sent him two £500 notes as a fee. From this time forth, E.'s good fortune as an advocate was uninterrupted. In 1783, he was returned to parliament for Portsmouth. Four years and a half after he was called to the bar, he had cleared £8,000 to £9,000, besides paying his debts, he had got a silk gown, business of at least £3,000 a year, and a seat in parliament, and had made his brother lord advocate. In parliament, on the other hand, he failed so egregiously in his first speech as to leave scarcely any hope in the bosoms of his admirers, and what is very singular, his failure and lord Eldon's took place the same night. To some extent the phenomenon was accounted for by Sheridan's remark when he said to him: "Erskine, you are afraid of Pitt, and that is the flabby part of your character." But notwithstanding his political mortifications, his professional career went on with increasing brilliancy. In 1786, he was made attorney-general to the prince of Wales, by whom he was warmly patronized, but towards him and every one else he exhibited that manly independence which was the best part of his character. The fact of his appearing as counsel for Thomas Paine is more to his credit, than even the brave and honest speech which he made in his defense; whilst his removal in consequence from his office is, as lord Campbell has said, a lasting disgrace to those from whom the measure proceeded. Throughout the political trials which occurred in this country at that troubled period, he enacted the same manly part. When E. was proposed for the woolsack, an office far beyond his legal attainments, the king, George III., in consenting, exclaimed: "What! what! well! well!—but remember he is your chancellor, not mine." Yet his decisions as lord-chancellor, according to lord Campbell, are not so much *bad* as *superficial*, though by some equity practitioners they are spoken of as the *apocrypha*. E. was engaged in the defense of queen Caroline. He died 17th Nov., 1823.

ERSKINE, THOMAS, of Linlathen, 1788–1870; a Scotch writer on theology and religion. He was a descendant of the earl of Mar, regent of Scotland under James VI. He studied law at Edinburgh university, and, 1810, became a member of the faculty of

advocates. He retired from the bar in 1816, on succeeding to the family estate after the death of his brother. Erskine's principal works are: *Remarks on the Internal Evidence of the Truth of Revealed Religion; Essay on Faith; Unconditional Freeness of the Gospel; The Brazen Serpent; Doctrine of Election;* and *Spiritual Order and Other Papers.*

ERYN'GO, *Eryngium*, a genus of plants of the natural order *umbelliferæ*, having simple umbels, which resemble the heads of composite flowers, a leafy involucre and leafy calyx, and obovate, scaly fruit destitute both of ridges and vittæ. The species are numerous, mostly natives of the warmer temperate parts of the world, with alternate, simple, or divided leaves, which have marginal spines. One species only is common in Britain, the SEA ERYNGO, or SEA HOLLY (*E. maritimum*), which is frequent on sandy sea-shores; a very stiff, rigid, and glaucous plant. *E. campestre* has also been found in England and Ireland, but is very rare. Its root was formerly much employed in some parts of Europe as a tonic. That of *E. maritimum* is used in the same way, and possesses the same properties, being sweet and aromatic. It is sold in a candied state, and was formerly reputed stimulant, restorative, and aphrodisiac. Shakespeare makes Falstaff allude to the snowy color and supposed properties of this now almost disused sweetmeat, for the preparation of which Colchester has long been famous above all other places. E. root has also been used as an aperient and diuretic. Linnæus recommends the blanched shoots of *E. maritimum* as a substitute for asparagus. *E. fœtidum*, a native of the warm parts of America, is called fit-weed in the West Indies, a decoction of it being much used as a remedy in hysterical cases. *E. aquaticum*, a native of low wet places in North and South America, is called rattlesnake weed and button snakeroot. The root is diaphoretic and expectorant, and has a spurious reputation as a cure for the bite of a rattlesnake.

ERY'SIMUM, a genus of plants of the natural order *cruciferæ*, tribe *sisymbriæ*. The pod is four-sided. *E. cheiranthoides*, a branching annual, about 18 in. high, with lanceolate scarcely toothed leaves and small yellow flowers, is found in many parts of Europe, and also in North America. It is not uncommon in waste places and cultivated grounds in Britain, but may perhaps have been originally introduced for its medicinal use. Its seeds were formerly much employed as an anthelmintic, from which it has the name of WORM-SEED. It is also called TREACLE MUSTARD, because it was employed as an ingredient in the famous *Venice treacle*. *E. perfoliatum* is cultivated in Japan for the fixed oil of its seeds. Some of the plants formerly referred to E. are now included in other genera, as *sisymbrium* and *alliaria* (q.v.).

ERYSIP'ELAS (Gr. derivation uncertain), an inflammatory and febrile disease of the skin, attended by diffused redness and swelling of the part affected, and in the end either by desquamation or by vesication of the cuticle, or scarf-skin, in the milder forms, and by suppuration of the deeper parts in the severer varieties of the disease (phlegmonous erysipelas). E. affects, in a large proportion of instances, the face and head; it is apt to be attended with severe and typhoid fever (see FEVER), and often with great disorder of the nervous system, arising in some instances from inflammation of the membranes of the brain. In other parts of the body, severe or phlegmonous E. is apt to be succeeded by protracted and exhausting suppurations, and sometimes by diseases of the bones, or inflammations of the internal organs. E. is frequently an epidemic (q.v.) disease; it is also very apt to recur in a person who has been attacked once or oftener; and this is especially true of the form which affects the face. It is seldom that depletion is allowable in E., but the bowels should be well cleared out in most cases, and a diuretic (q.v.) given, after which the treatment consists for the most part in watching narrowly the progress of the case, keeping up the strength as well as possible, and obviating special dangers as they occur. In some cases, iron is used as a specific remedy.

ERYTHE'MA (Gr. *eruthainō*, I redden), a minor form of erysipelas (q.v.), presenting the same tendency to diffusion and redness, but not so much swelling, and little disposition towards suppuration, or even vesication. E. is chiefly dangerous when it presents itself in a wandering shape, attended with slow consuming fever. The muriated tincture of iron, in doses of twenty drops in water every hour or two, has been regarded as a specific in this disease, as well as in erysipelas. Some forms of E. are distinctly connected with constitutional diseases, as gout, rheumatism, syphilis, etc., and depend for their cure on the removal of the cause.

ERYTHRÆ'A. See CENTAURY.

ERYTHRÆ'AN SEA, in ancient geography, a name applied to an indefinite expanse of the Indian ocean, but including the Persian and Arabian gulfs. Later geographers restricted the name Erythræan to the Arabian gulf.

ERYTHRI'NA. See CORAL FLOWER.

ERYTHRO'NIUM, a genus of bulbous-rooted plants of the natural order *liliaceæ*, with drooping flowers and the segments of the perianth reflexed. *E. dens canis*, the DOG-TOOTH VIOLET, so called because of the resemblance of its little white bulbs to dogs' teeth, is a well-known ornament of our flower-borders in spring. It is a native of the

central parts of Europe and s. of Siberia. Anthelmintic properties are ascribed to the bulbs. Those of *E. Americanum* are emetic.

ERYTHROPHLÆ'UM, a genus of trees of the natural order *leguminosæ*, sub-order *mimosæ*. *E. Guineense*, a native of Guinea, is a very large tree, 100 ft. high, remarkable for the great quantity of red juice which every part of it contains, and interesting on account of the employment of this juice by the natives for an ordeal to test the innocence or guilt of a person accused of crime. The juice is swallowed in large draughts, and those who remain uninjured by it are supposed to be innocent.

ERYTHROXYLA'CEÆ, a natural order of exogenous plants, allied to the *malpighiaceæ*. They are trees or shrubs, with alternate simple leaves, stipules, flowers growing from amidst scale-like bracts, calyx of five sepals, corolla of five petals, each petal having a curious appendage—a plaited scale—at the base, 10 stamens united at the base, a three-celled ovary with two cells empty, and the third containing a single ovule, three styles, and the fruit a drupe. Nearly 100 species are known, natives of warm countries, and chiefly of tropical America. To this order belongs the coca (q.v.). The wood of some of the species is bright red; that of *erythroxylon* (Gr. red wood) *suberosum* is used in Brazil for dyeing, and a permanent red is obtained from it. That of *E. hypericifolium* is the *bois d'huile* (oil-wood) of Mauritius.

ERYX, an ancient city and mountain in the w. part of Sicily, near the sea-shore. There was once a temple to Venus on the mountain. Eryx was taken and retaken in the Carthaginian wars, and was partially destroyed by Hamilcar. The site of the old city is now occupied by a convent, and the mountain by a Moorish castle, used as a prison, around which is the modern town of San Guilano.

ERZBERG. See EISENERZ.

ERZERUM', or ERZROUM, a province embracing a large portion of Turkish Armenia, bordering on Russia and Persia, between 39° and 41° n. and 39° and 44° e.; pop. about 500,000. It is mainly a high table-land, and is traversed by several mountain ranges, between which are fertile valleys. The climate is subjected to extremes of cold and heat. The chief rivers are the Aras, or Araxes, the Euphrates, and the Kur. Chief town, Erzerum.

ERZERUM', or ERZROUM', properly *Erserum*, a strongly fortified t. in Turkish Armenia, in lat. 39° 55' n., and long. 41° 20' e., not far from the northern source of the Euphrates. It is situated in a high, but tolerably well cultivated plain; its site being 6,200 ft. above the level of the sea. The climate is cold in winter, but dry in summer. E. is the residence of an English, a Russian, and a French consul; and its pop. is estimated at 40,000, consisting of 30,000 Turks, 8,000 Armenians, and 2,000 Persians, who carry on a brisk trade, and have thus attained to a degree of prosperity unusual in the east. The copper and iron wares of E. have acquired a wide celebrity. Situated at the junction of the important highways leading from Trebizond, Transcaucasia, Persia, Kurdistan, Mesopotamia, and Anatolia, E. forms an entrepôt of commerce between Europe on the one hand, and the interior of Asia, and particularly Persia, on the other. The streets, the houses of which are built chiefly of volcanic stone cemented with mud, are narrow, crooked, and filthy; and ruins of fortifications and of buildings formerly magnificent, everywhere meet the eye. The town consists of the fortress, strictly so called, and four suburbs. The fortress, which is inclosed by a high wall, has, on the w., a citadel called Ijkaleh, with many curious monuments, and a mosque of Christian origin. The fortress also contains 15 mosques, the residence of the chief magistrate, some caravanseras, and a few elegant houses belonging to the higher order of officials and Mohammedan merchants. The suburbs boast 24 mosques, several Armenian churches, and a number of large bazaars and caravanseras. E. imports shawls, silk goods, cotton, tobacco, rice, indigo, etc.; and exports corn, sheep, and cattle, horses, mules, and gall-nuts. The principal trades carried on are tanning, dyeing morocco, and blacksmiths' and coppersmiths' work. But since Russian Transcaucasia has provided a safe trade-route to Persia, the prosperity of E. has greatly suffered. E. is a very ancient town. Its Armenian name was *Garin Khalakh*. Near it stood the old Syro-Armenian town of Arsen. When the Seljuks captured this place, the inhabitants fled to a fortress at E., which the Seljuks accordingly called *Arsen-er-Rum*, i.e., Arsen of the Romans (or Byzantines), whence the modern Erzerum. In 1201, it fell into the hands of the Seljuks; of the Mongols in 1242; and finally, in 1517, into those of the Turks. It still, however, continued to be the most important city in the country, and at the commencement of the 19th c. had a pop. of 100,000 inhabitants. In the war of 1829, between the Turks and Russians, the taking of E. by the latter decided the campaign in Asia. E. was an important military center during the war of 1877-78, and much hard fighting was done in its neighborhood. In Dec., 1877, the Russians closed round the city, already hard pressed, and reduced its defenders to the utmost distress: in Feb., 1878, it was surrendered to Russia. The Russians held it till Oct., 1878, when it was given up to the Turks.

ERZGEBIRGE ("Ore Mountains"), the name given to the chain of mountains, rich in metals, stretching in a south-westerly direction, on the confines of Saxony and Bohemia, from the valley of the Elbe to the Fichtelgebirge, in long. 12° 20' e. In the

s., it rises to a height of from 2,000 to 2,500 ft., forming a steep wall of rock; in the west, it forms broad, slaty plateaus, and gradually slopes down towards the Saxon side to the level districts of Altenburg and Leipsic. In consequence of this formation, the streams flowing southward are small, while the n. side of the chain, which is well wooded, presents a series of romantic, and occasionally fertile and thickly peopled valleys, watered by the Mulde, the Pleisse, and their numerous tributaries. The town of Gottesgabe, the site of which is the highest in Germany, is situated towards the s. of the E. range, in long. 12° 54′ e., at an elevation or 3,162 feet. The Keilberg, the highest point of the range, is 3,802 ft. above the level of the sea. The E. is chiefly of the gneiss-granite formation, in which most of the metal strata are to be found. Porphyry and basalt likewise appear.

ESARHAD'DON was the son of Sennacherib, king of Assyria. Nothing is known, positively, concerning him until his accession to the throne after the murder of his father by two other sons. The length of his reign cannot be determined, but the number of his military expeditions and the extent of his architectural works show that it must have continued many years. The order in which its principal events occurred is not known. He reigned personally at Babylon as well as Nineveh, having palaces at both cities and residing alternately in each. This fact explains and justifies the Scripture statement that Manasseh, king of Judah, when taken captive, was brought before the king of Assyria at Babylon. The monuments indicate that E. was one of the mightiest of the Assyrian kings. He conquered all Asia between the Persian gulf, the Armenian mountains, and the Mediterranean sea. On the w., his influence extended over Cilicia and Cyprus; on the e., he made war against tribes which his fathers had not known; and on the s., asserted authority over Egypt and Ethiopia. He built numerous temples that shone with silver and gold, and palaces that surpassed in magnificence those of his predecessors. The s.w. palace at Nimrud, built by him, was of extraordinary size, its great hall being 220 ft. by 100, and its porch 160 ft. by 60. It was adorned with the usual array of winged bulls, colossal sphinxes, and sculptured slabs of alabaster. When first uncovered it was apparently in a good state of preservation, but it was soon evident that fire had raged through it, splitting and calcining the alabaster slabs, which consequently crumbled to dust when exposed to the air. In his unfinished palace at Calah the slabs around the rooms were smoothed in readiness for the inscription, but when they were turned, in order to be carried away, their backs were found to be sculptured, showing that they had been taken from an older building, and that E., having consigned to oblivion the records of a former reign, was preparing to celebrate his own exploits on the reversed sides of the slabs.

E'SAU ("hairy" or "rough"), the eldest son of Isaac, and twin-brother of Jacob. As E. grew up, he became "a man of the field," a cunning hunter, and his father's favorite. He seems to have been a wild, rough, hearty Bedouin, or son of the desert, thinking nothing of to-morrow, but living with joyous carelessness from day to day. This is apparent from the manner in which he allowed Jacob to defraud him of his birthright, although it carried with it, besides many temporal advantages, the *Covenant-blessing* itself. After this transaction, E., when 40 years of age, married two Canaanitish women, "which were a grief of mind unto Isaac and to Rebekah" (Gen. xxvi. 35). Then follows the narrative of Jacob's personation of his brother, and his securing irrevocably the blessing to himself. E. now swore to kill his brother, whereupon Rebekah sent Jacob to his uncle Laban in Padanaram. E. next married his cousin Mahalath, the daughter of Ishmael; and appears to have established himself in his wife's country, to the s. of Palestine, in Mt. Seir. Here he lived probably as a predatory chief. When Jacob was returning from Padanaram, E. encountered him with 400 of his Bedouins. The meeting was a touching one. The wild borderer at least was in earnest. "Esau ran to meet him, and embraced him, and fell on his neck, and kissed him" (Gen. xxxiii. 4). His anger had long died out. E. next appears at the burial of his father Isaac, whom he seems to have loved with the warm and simple affection of a child of nature, and having obtained his share of the property, "went into the country from the face of his brother Jacob" (Gen. xxxvi. 6). From E. the region of Mt. Seir took the name of Edom (q.v.), and his posterity are generally called Edomites.

ESCALADE (Fr. from Lat. *scala*, a ladder), in siege operations, is a mode of gaining admission within the enemy's works. It consists in advancing over the glacis and covert-way; descending, if necessary, into the ditch by means of ladders; and ascending to the parapet of the curtain and bastions by the same ladders differently placed. The ladders are either procured on the spot, or are sent out with the siege-army. A convenient form is in pieces of 12 ft. length, fitting end to end by means of sockets. A firing-party is usually told off, to keep down the fire of the enemy upon the escaladers, especially a flank fire lengthwise of the ditch, which might sweep them off with terrible rapidity. The leaders of an E. constitute a "forlorn hope."

ESCAL'OP-SHELLS are often used in heraldry to signify that the bearer has made many long voyages by sea. As the Pilgrim's (q.v.) emblem, they were commonly given to those who had been to the crusades; they came to be regarded as indicating either that the bearer or his ancestor had been a crusader. The escalop-shell was the emblem of

St. James the great, and is generally met with in churches dedicated to him. The more ordinary form of the name is scallop-shell (q.v.).

ESCAMBIA, a co. in s. Alabama on the Florida border, intersected by Escambia and Conecuh rivers, and the Mobile and Montgomery railroad; 1000 sq.m.; pop. '70, 4,041—951 colored. The soil is level and sandy, and not very productive. Co. seat, Pollard.

ESCAMBIA, a co. on the extreme w. of Florida, on the gulf of Mexico between the Escambia and Perdido rivers, intersected by the Pensacola and Mobile railroad; 800 sq.m.; pop. '70, 7,817—2,880 colored. It has a level sandy soil, not very productive, and to a large extent covered with pine forests. Co. seat, Pensacola.

ESCAPE'MENT is the term applied to that part of the machinery of a watch or clock by which the onward revolving motion produced by the moving power, whether weights or spring, is brought into contact with the regulating movement of the pendulum or balance-wheel. See HOROLOGY.

ESCAPE WARRANT is a warrant issued by a judge for the apprehension of persons who have escaped from the queen's bench or fleet prisons. This power is conferred by 1 Anne, s. 2, c. 6, followed by 5 Anne, c. 9. The warrant may be issued by any judge of the court wherein the action was tried, or judgment and execution obtained, upon oath in writing, of the escape of the party, made before himself, or before one of the commissioners to take oaths. The apprehension may be effected on Sunday. The person apprehended is committed to the charge of the sheriff of the county, who is made responsible for his safe keeping.

ESCARP', in fortification, is the side or slope of the ditch next the rampart, and of the parapet itself. When the ditch of a fortress is dry, the E. is usually faced with mason-work, to render it difficult of ascent; and behind this facing (*revêtement*) there are often passages or casemates for defense. In temporary fortifications, the *revêtement* is sometimes of wood; and in field-works, palisades at the foot, or fraises on the *berme* or edge of the ditch, are held sufficient. The E. is always made at as large an angle as the nature of the soil will allow; the design being to offer the greatest possible obstacle to an assailant.

E'SCARS are large heaps of gravel, consisting chiefly of carboniferous limestone, that were accumulated during the pleistocene period. They occur in central Ireland, but are identical with the *ösar* of Sweden; and under the name of *kames*, they are not unknown in Scotland. The gravel is often heaped into narrow ridges 40 to 80 ft. high, and from 1 to 20 m. long.

ESCAUT. See SCHELDT.

ES'CHAR (Gr. *eschara*), a slough or portion of dead or disorganized tissue. The name is commonly applied to artificial sloughs produced by the application of caustics (q.v.).

ESCHAROT'IC (Gr.), causing an eschar. See CAUSTIC.

ESCHATOL'OGY, the doctrine concerning the last things, in the Christian system, treats of the millennium, the future coming of Christ, the state of man after death, the resurrection, last judgment, and final condition of mankind.

I. *The Millennium and the Future Coming of Christ.*—The xxth chapter of Revelation speaks of a period of a thousand years during which Satan shall be bound in the bottomless pit, and the souls of them who had been beheaded for the witness of Jesus and for the word of God, and who had not worshiped the beast or his image, and had not received his mark upon them, shall live and reign with Christ. This is called the first resurrection. Many persons, uniting this passage with others and professing to interpret them literally, teach that the millennium will be preceded by the second coming of Christ in visible glory, and by the resurrection of the glorified saints to reign with him on earth. Their opinion on this important point naturally colors their interpretation of a large portion of Scripture and of their practical duties as Christians. Many of them are very earnest and confident in the maintenance of their views. In opposition to them the usual faith of Christians has been that the millennium will precede the visible coming of Christ, and will be accomplished through the divine blessing, given in copious measures, on the diligent use of such means of grace as the church has always employed. They who adopt this view regard the passage in the Revelation concerning the first resurrection as figurative (as the rest of the book manifestly is), and the coming of Christ, promised in the New Testament, as: 1. An exhibition of his providential government over the history of the world and of the church. In this sense the destruction of Jerusalem by the Romans, followed by the dispersion of the Jews, Matt. xxiv. 4–28, and the establishment of the kingdom of Christ, with the gathering of his elect, 29–44, were foretold by him as a coming of the Son of Man. 2. His spiritual presence with his people during their lives and work on the earth, and at the time of their death, Matt. xviii. 20; John xiv. 23, 3. 3. His glorious appearing to judge the world, Matt. xxv. 31; I. Thes. iv. 16.

II. *The State of Man after Death.*—1. Materialists, who assert that the soul is only a function of the body say, consistently enough, that at death both perish together. 2. Pantheists, who maintain that man is a transient form of God's existence, teach that the soul has no consciousness after death. The race is immortal, but the individual

man is not. Flowers bloom from generation to generation, but each flower blooms but once, and after that exists no more. 3. Some, who are neither materialists nor pantheists, suppose that the soul cannot act or manifest itself without a bodily organism, material or other, and that consequently at death it must either cease its activity, or be furnished at once with a new body. The latter part of the alternative many of the class referred to do not hesitate to accept. "Do the dead cease to exist?" they ask, and quickly reply, "No: for there is the spiritual body as well as a natural body; at death the latter is dissolved, but the former is not affected; therefore the life of the soul, still clothed upon, remains unharmed." Those who reject this theory deny that the soul is dependent on matter for the exercise of its faculties, or for its personality, or its susceptibility. Certainly God, who is purely a spirit, is not thus dependent: and as men have a spiritual nature like that of God, the theory cannot be true concerning them. To this it is rejoined that the theory of a "spiritual body" does not require that it be any form of *matter*. 4. Many who reject or disregard the Bible, while they do not deny that the soul continues to exist after death, say they have no proof that it does. Some of this class when dying have declared that they were taking a leap in the dark. 5. The Scriptures teach the continued existence of the soul after death. The Pentateuch teaches it when it calls God the God of Abraham, Isaac, and Jacob after their death, thus implying that they still lived. The Psalms teach it when they speak of the soul as redeemed from the power of the grave, and as being satisfied when it awakes in God's likeness. The prophets teach it when they declare that the dead shall live, that they shall awake and shine as the stars forever and ever. The New Testament teaches it by the promises of Christ, "I give unto them eternal life and they shall never perish;" and by the affirmation of the apostles that Christ hath abolished death and brought life and immortality to light. 6. All who believe in a future resurrection and final judgment necessarily believe in an intermediate state of the soul after death, in some respects different both from its former condition in this life and from its final condition in the life to come. The question is, What is the nature of this intermediate state? (1) Some suppose that between death and the resurrection the soul continues in an unconscious state. Since the Bible speaks of death as a sleep, and since a dead body is as incapable of sleep as a stone, it must be (they think) the soul that sleeps. To this a sufficient answer is that in death the outward appearance of the body is exceedingly like sleep, and that it is for this reason death is compared to it; just as, on the other hand, the actual sleep of a living person has been called the "counterfeit of death." (2) The Roman Catholic church teaches that all who, dying in the peace of the church, are not perfect, pass into purgatory, concerning which they say that it is a state of suffering designed for both expiation and purification; that the duration and severity of the suffering are proportioned to the sinfulness of the sufferers; that the duration may be shortened and the severity alleviated by the prayers of the saints and the sacrifice of the mass; and that it is the prerogative of the church to remit, entirely or in part, the penalty of sins under which the soul suffers. This doctrine was not held, in its completeness, even by Roman Catholics until a comparatively late period. "Purgatory as a burning away of sins," said Dollinger at the Bonn conference of Old Catholics in 1875, "was an idea unknown, in the east as well as the west, until Gregory the great introduced it. What was thought was that after death those who were not ready for heaven were kept for some time in a state of preparation, and that the prayers of the living were an advantage to them. Gregory the great added the idea of a tormenting fire. This the schoolmen gradually converted into doctrine which they associated with papal indulgence, till it came to apply to the dead generally, which of course made all seek for indulgence. It went on to have degrees (some could receive indulgence for a few of their sins, others for all), so that eventually the pope, having already the keeping of heaven and the dominion on earth, obtained also sovereignty under the earth." (3) The general faith of Protestants is not uniform on this point; probably the prevalent view is "that the souls of believers are at their death made perfect in holiness, and do immediately pass into glory." According to this view the intermediate state of believers is one of perfect freedom from sin and suffering, and of great exaltation and blessedness. This is not inconsistent with believing that after the second coming of Christ and the resurrection the soul will be still more exalted and blessed. And with it may be mentioned, as not altogether contrary to it, the opinion of many, in both ancient and modern times, that "sheol" and "hades" are general terms for the intermediate dwelling-places of the dead, one division of which is "paradise," the happy abode of the saved; and the other "gehenna," the wretched abode of the lost.

III. *The Resurrection.*—Faith in the resurrection of the body, as additional to the future life of the spirit, rests on revelation. Swedenborgians (and some others in part agree with them) hold that man in this life has two bodies, one external and material, which dies and is buried, never to rise again; the other internal and psychical, which, incapable of death, passes in union with the soul into the invisible world as its spiritual body: the resurrection, therefore, in their view occurs at the moment of death. The Scriptures, in their obvious sense, plainly teach an actual resurrection of the dead. "All that are in the graves shall come forth." "That which is sown a natural body shall be raised a spiritual body." "The corruptible must put on incorruption, and the

mortal immortality." In some true and noble sense, the body raised will be personally representative of that deposited in the grave; for St. Paul, denying the identity of the two—"thou sowest not the body that shall be," and declaring the divine mystery—"God giveth to the seed a body as it hath pleased him," asserts the reciprocal pertinence of the two, each to each—"and to every seed his own body." Zoologists teach that with every living germ there is an immaterial principle by which one species is distinguished from another. In like manner, some suppose that as the soul is created to be incarnate, it is endowed with forces to that end; that, besides its rational, voluntary, and moral faculties, it has what may be called a vital force, which secures the formation of a body suited to its necessities and sphere. Concerning the nature of the spiritual body, nothing can now be known except what Scripture has revealed. From this source we learn that it will be an organism not of flesh and blood, but specially suited to the new state of being in which man is to live and act. Yet it is probable that it will be the glorified likeness of the human form as it existed in this life—the ideal human organism actualized.

IV. *The Final Judgment.*—The consciences of men affirm that God as the judge of all the earth must do right, and also that his moral government, as administered in this present world, does not fully render unto all according to their character and desert: "There are just men unto whom it happeneth according to the work of the wicked; and there are wicked men unto whom it happeneth according to the work of the righteous." Consequently, reason, even among the heathen, calls for a settlement of the destinies of men, so that the justice of God may be vindicated. The Scriptures declare that a final settlement will be made: "God shall bring every work into judgment, with every secret thing, whether it be good or whether it be evil." This judgment is represented as a definite future event, in which the destiny of men and of angels will be determined and manifested: "God hath appointed a day in which he will judge the world in righteousness." The word "day," while not to be taken literally, implies, it is claimed, a definite and limited period. Christ, as God manifest in human personality, and as having made atonement for the sins of mankind, will be the judge: "The Father hath given him authority to execute judgment also because he is the Son of Man." The ground of judgment will be the deeds done in the body; and the character and life of each man will be judged according to the light that he had, and (if he knew the gospel) according to the relation (determined by his own choice) which he sustains to Christ: "He that heareth my word and believeth on him that sent me hath everlasting life, and shall not come into condemnation; but is passed from death unto life."

V. *The End of the World.*—The Scriptures teach that the existing heaven and earth are to be replaced by a new creation: "They shall wax old as a garment and be changed." "The heavens shall pass away with a great noise, and the elements shall melt with fervent heat; the earth also and the works that are therein shall be burned up. Nevertheless, we, according to his promise, look for a new heavens and a new earth wherein dwelleth righteousness." "I saw a new heaven and a new earth; for the first heaven and the first earth were passed away, and there was no more sea." 2. In the Scriptures, the abode of the saved is sometimes called the better country, even the heavenly; sometimes "the city which hath the foundations;" and sometimes a "house not made with hands," as when the Savior said, "In my Father's house are many mansions, I go to prepare a place for you." 3. The blessedness of the heavenly state may be conceived of as arising, in part, from the vision of God in his glory as seen in the Lord Jesus, from the experience of his love, from the enlargement and glorification of the mental faculties, from the absence of sin and sorrow, from intercourse and fellowship with the holy and happy society of heaven, and from the possession of all good. 4. The wretchedness of the lost—of which, as to its nature or modes, little appears in the Bible, while its certainty and reality are abundantly declared—is conceived of as consisting, partly, in eternal separation from the society and influence of the good, and from fellowship with God's glory, blessedness, and love; in the presence and influence of ungodly and wicked beings; in remorse of conscience and in the power of sin in the soul. Some claim scriptural authority for conceiving of it as consisting in the ultimate and utter extinction of the personal being, sinking under sin. 5. The blessedness of the saved and the wretchedness of the lost appear in the Scriptures as without end. After much debate as to exegesis of the texts involved, the drift of the most recent critical scholarship may be said to be unmistakably towards this decision—that while the Greek language did not possess, as the Greek thought did not require, terms which necessarily carried the meaning of absolute eternity, as we now employ that word (e.g., in reference to the being of God), Christ and his apostles used, in reference to future reward and retribution, such words expressive of unlimited duration as were furnished by the language of their time; and that the whole manner and bearing of their speech on this point seems to intend an avoidance of any suggestion of an end. Especially in regard to retribution, the fact is recognized that the most decisive utterances concerning it are not from the apostles, but from Christ himself, who as the "light of the world," and the professed Savior of men, would have been quick to supply the hope of limited duration, had any such hope been within his thought. There is, however, to be noted a tendency towards statements on this point far less sweeping and dogmatic than were

formerly advanced, and a distinct enlargement of the bounds of admitted variations of belief concerning it among the denominations called evangelical.

ESCHEAT' (Fr. *echoir*, from Lat. *cadere*, to fall or happen), an incident of the feudal law whereby, when a tenant in fee-simple died, leaving no heir capable of succeeding, the land reverted to his lord. By the earlier usages, this effect took place where there was no representative of the vassal in the 7th degree, which, according to later custom, was extended to male descendants *in infinitum* (*Lib. Feud.*, i. 1, s. 4). According to the law of England, escheats are of two kinds—*propter defectum sanguinis*, and *propter delictum tenentis*. The former was in accordance with the feudal usage; so that if the owner of an estate in fee-simple dies without leaving an heir, and without having disposed of his estate by deed or will, the land reverts to the overlord, who in the present day is almost invariably the sovereign, except in copyhold estates, which E. to the lord of the manor. The most frequent instance of E. is in the case of the death of a bastard, who, having no relations but descendants, the lands on his death intestate and without issue, must revert to the crown. E. *propter delictum tenentis* is peculiar to the English law. It happened where a tenant in fee-simple had been guilty of treason or felony, in which case, not only his estate in possession, but any estate which might devolve upon him by the rules of descent, escheated to his lord; so that all who might succeed through him were cut off from the inheritance. This rule applied to all felonies, and was productive of much hardship. By modern legislation, it has been provided that attainder for felony shall not operate as a bar to inheritance, except in case of treason or murder (54 Geo. III. c. 145, 3 and 4 Will. IV. c. 106, 13 and 14 Vict. c. 60). This species of E. is to be distinguished from forfeiture of lands to the crown for treason, which prevailed in other countries besides England. See FORFEITURE.

E. in Scotland is of two kinds—1. The total forfeiture to the crown of all property heritable and movable belonging to a person who has been convicted of treason. 2. It signifies the forfeiture of goods by a debtor who has failed to make payment of debt in obedience to legal diligence (q.v.). This species of E. for debt was abolished by 20 Geo. II. c. 50. It was of two kinds: single E., and life-rent escheat. By the former, all the debtor's movables were forfeited to the crown; by the latter, the annual profits of the debtor's estate were forfeited to the superior. Single E. still exists in Scotland as a punishment of crime. In all capital convictions, it is ordered that the prisoner's "whole movable goods and gear be E. and inbrought to his majesty's use." In cases of deforcement, bigamy, perjury, and some others, single E. is imposed by statute as a portion of the penalty on conviction. Single E. also falls upon denunciation for outlawry; and if the rebel continues for a year under denunciation, his life-rent E. falls to his superior.

ESCHELLES, LES, a village in Savoy (formerly a Sardinian, now a French state), is situated on the Guier, 12 m. s.w of Chambéry. The valley beyond this village and on the road to Chambéry is blocked up by a huge limestone rock 800 ft. high, over which travelers formerly used to climb by means of ladders, and hence the name given to this village. Through this mass of limestone the public road now passes by means of a tunnel, which is 25 ft. high, of equal width, and 1000 ft. long. The tunnel was projected and commenced by Napoleon I., and finished in 1817 by the king of Sardinia.

E'SCHENBACH, WOLFRAM VON, a celebrated poet of the middle ages, was b. in the second half of the 12th c., of a noble family, which derived its name from the village of Eschenbach near Ansbach. He received the honor of knighthood at Henneberg, and passed his life in knightly fashion. In 1204, he came to the court of Hermann, landgraf of Thuringia, where he shone among the poets of the time, at the so-called Wartburg-war (a rivalry of the German minstrels held at Wartburg in 1206 or 1207). Hermann's successor, Ludwig the pious, appears to have shown E. little favor, in consequence of which he withdrew from the Thuringian court towards the close of his life. He died some time between 1219 and 1225, and was buried in his native village. E.'s poems are partly original, and partly fashioned after French and Provençal models. His rich fancy, deep sentiment, and vivid power of representation, as well as his elegant mastery of language and versification, give something of an epic character to his works, the principal of which are *Parcival*, composed before 1212, *Wilhelm von Orange*, and *Titurel*. Besides these, we have several love-songs of his. E. exercised an important influence on his time, but subsequently was almost forgotten; and it is only recently that he has been restored to his place of honor. The first critical edition of his works was that by Lachmann (Berl. 1833). They were translated into modern German by San-Marte (2 vols., Magdeb. 1836–41), and with greater accuracy, though with too slavish literalness, by Simrock (2 vols., Stuttg. 1842).

ESCH'ENMAYER, KARL ADOLF AUGUST VON, 1770–1852; b. Würtemberg; teacher of practical philosophy at the university in Tübingen, 1818–36; author of many works on philosophy, some of which were directed against the theories of Hegel and against the *Life of Jesus*, by Strauss. He carried a strong tendency to mysticism into his physical researches, and took a deep interest in the phenomena of animal magnetism, becoming at last a devout believer in demoniacal and spiritual possession.

ESCHER, Joh. Heinr. Alfred, a distinguished Swiss statesman, was b. at Zurich, 20th Feb., 1819, and studied at Bonn and Berlin. In 1842, he was created doctor of law at Zurich; and spent the two following years in Paris, devoting his attention chiefly to studies connected with Roman law. On his return to Zurich, E. became a lecturer in the high school, the subject of his lectures being chiefly the political law of the Swiss confederacy. In 1844, he was elected member of the great council of the canton, and was thus drawn into the arena of practical statesmanship. Even at that early period, his sentiments were decidedly liberal. In Jan., 1845, along with six others who shared his opinions, he published the famous summons to the popular assembly in Unterstrass for the expulsion of the Jesuits. His election into the council of the interior in 1845, and into the council of education in 1846, opened a wide field for his administrative talents in his native canton. The reorganization of the schools in the canton of Zurich, according to the demands of the time, is chiefly his work. In Dec., 1847, he became president of the great council; and in his opening speech, recommended the complete reform of the confederacy, and the greatest possible centralization. In 1848, he was sent as a deputy to the federal diet; and, along with M. Münzinger, was charged with the negotiations entered into between Switzerland and Austria, in regard to the canton of Tessin. In Dec. of the same year, E. became president of the newly elected council of regency. Since that time, his energies have been chiefly directed to education, the reorganization of church policy, and the promotion of railway enterprise and banking institutions in Switzerland. He became president of the national council in 1849, and held the post of vice-president in 1856–57, and 1861–62.

ESCHOLTZ BAY, a portion of the Arctic ocean in Alaska, U. S., forms the innermost part of Kotzebue sound, the first great inlet to the n.e. of Behring's strait. It is about long. 161° w., being barely on the outside of the polar circle. It is worthy of notice chiefly on acount of its fossil remains, which, though common on the northern coast of Siberia, are comparatively rare on that of the new continent.

ESCHSCHOLT'ZIA, a genus of plants of the natural order *papaveraceæ*, of which *E. Californica*, and other species, natives of California, have now become very common in our flower-gardens, making a showy appearance with their large deep yellow flowers. The genus is remarkable for the calyx, which separates from the dilated apex of the flower-stalk, being thrown off by the expanding flower, and much resembling in its form the extinguisher of a candle.

ESCHWEGÉ, a t. of Prussia, in the province of Hesse-Nassau, is situated on the left bank of the Werra, 25 m. e.s.e. of Cassel. It consists of an old and new town, and a suburb; is surrounded with walls pierced by six gates; and is well built. The only building of note is the castle, which was long the residence of the landgrafs of Hessen-Rotenberg. E. has manufactures of woolen and linen fabrics, numerous tanneries, and several oil and other mills, also some trade in fruit and victuals. Pop. '75, 7,724.

ESCHWEILER, a t. of Rhenish Prussia, in the circle of Aachen, and 9 m. e.n.e. from the city of Aachen (Aix-la-Chapelle), is a station on the railway between Aix-la-Chapelle and Cologne, and stands at the confluence of the Inde and Dente. It has extensive manufactures of ribbons, woolens, canvas, needles, iron-wire, and machinery, also of wax-cloth, lace, glass, vitriol, and vinegar. In the vicinity are mines of zinc and lead. Pop. '75, 15,540.

ESCOBAR' Y MENDO'ZA, Antonio, 1589–1669; a Spanish casuist descended from the illustrious house of Mendoza; educated by the Jesuits and a member of the order. He was a preacher for 50 years, delivering sometimes two sermons in a day. His principal works were on casuistry and on Scriptural commentary. His casuistry was severely criticised in the *Provincial Letters* of Pascal, and ridiculed by Boileau, Molière, and La Fontaine, and the name Escobar became a synonym in France for extreme laxity in moral principle.

ESCORT. See Convoy.

ESCU'DO DE VERA'GUA denotes at once a river and an island on the Atlantic side of Central America—the latter being at the mouth of the former. They are situated a little to the e. of the boundary between New Granada and Costa Rica. The island is in lat. 9° n., and long. 81° 30′ w.; and the river, being only 15 m. long, derives its importance, if any, from the narrowness of the belt which here separates the two oceans.

ESCU'RIAL (the correct title is El Real sitio de San Lorenzo el real de Escorial), a famous monastery of New Castile, in the province of Madrid, and situated 30 m. n.w. of the town of that name. This solitary pile of granite has been called the eighth wonder of the world, and at the time of its erection surpassed every building of the kind in size and magnificence. It owes its origin (at least, so it is said) to an inspired vow made by Philip II. during the battle of St. Quentin. On that occasion, he implored the aid of St. Lorenzo, on whose day, 10th Aug., 1557, the battle was fought; and vowed that, should victory be granted to him, he would dedicate a monastery to the saint. The E. is built in the form of a gridiron, in allusion to the instrument of St. Lorenzo's martyrdom, and forms a huge rectangular parallelogram 744 ft. from n. to s., and 580 ft. from e. to w., and divided into long courts, which indicate the interstices of the bars. Towers at each angle of this parallelogram represent the feet of the

gridiron, which is supposed to be lying upside down; and from the center of one of the sides, a range of building abuts, forming the royal residence, and representing the handle. The E. was begun in 1563, and finished in 1584, and was intended to serve as a palace, mausoleum, and monastery. It has a splendid chapel with three naves, 320 ft. long, and 320 in height to the top of the cupola. The *pantheon*, or royal tomb, is a magnificently decorated octagon chamber, 36 ft. in diameter by 38 ft. high, in the eight sides of which there are numerous black marble sarcophagi. Kings only and the mothers of kings are buried here. The E. is an immense building; it is stated that it has 14,000 doors and 11,000 windows, and its cost was 6,000,000 ducats. Its library, previous to the sack of the E. by the French in 1808, contained 30,000 printed and 4,300 MS. volumes, mainly treasures of Arabic literature, of which a catalogue, but not a good one, was drawn up by Casiri in his *Bibliotheca Arabico-Hispanica* (2 vols., Madrid, 1760–70). They were, however, at that time removed to Madrid; and on being sent back to the E., it was discovered that the library consisted only of about 20,000 volumes—a third of the whole having been lost. The French also plundered the place of its valuable collection of coins, medals, and pictures. On Oct. 2, 1872, the E. was struck by lightning, and partially burned. The E. is saved from going to ruin by grants of public money, which are occasionally made.

ESCUTCHEON, in heraldry, is synonymous with shield (q.v.).

ESCUTCHEON OF PRETENSE, or INESCUTCHEON, is a small shield placed in the center of the larger one, and covering a portion of the charges on the latter, in which a man carries the arms of his wife when she is the heiress of her family. It is said to be carried *surtout*, or over-all. Sometimes also a shield over-all is given as a reward of honor; thus, the earl of Stirling did bear two coats quarterly, and over all an inescutcheon of Nova Scotia, because he was the first planter of it.—*Mackenzie, Heraldry*, p. 82.

ESDRAËLON, a great plain in Palestine, separating the mountain ranges of Galilee from those of Samaria. It forms a triangle between Nazareth in the n., a pass opening toward Akka in the w., and Jenin, the ancient Euganium, in the south. The watershed extending from Nazareth to Jenin, about 15 m., may be considered the base of the triangle, and divides the lands drained by the Jordan from those watered by the Kishon. The Galilean hills, forming the n. boundary of the plain, extend from Nazareth w. 12 m., and there draw near the Carmel range, forming a narrow pass by which the Kishon finds egress toward the sea. The Carmel, or Samaria, range extends from this pass s.e. 18 m. to Jenin. The e. boundary rises at times into high hills, the most important of which is Mt. Gilboa. The plain is sometimes called the valley of Jezreel. This plain of E. has in all history been a battle-field. It was the scene of important battles between the Israelites and their enemies, among them the triumph of Barak and the defeat of Saul and Josiah. Here the Egyptians and the Assyrian hosts met in repeated struggles, and in later times it appears in the wars of Napoleon. In the sublime imagery of the book of the Revelation, this plain appears as the scene of the last great struggle between the powers of good and evil.

ESDRAS, BOOKS OF. The word *Esdras* is the Greek form of Ezra, and indicates that the books so named do not exist in Hebrew or Chaldee. In the Vulgate, the first book of Esdras means the canonical book of Ezra; and the second, the canonical book of Nehemiah; whilst the third and fourth are what we call the first and second books of Esdras. But in the Vatican and other editions of the LXX., what we call the first book of Esdras comes first, and is followed by the canonical book of Ezra, which is termed the *second* book of Esdras. In all the earlier editions of the English Bible the order of the Vulgate is followed. The Geneva Bible was the first to adopt the classification now used, according to which Ezra and Nehemiah give their names to two canonical books, and the two apocryphal become first and second Esdras. As regards the *first* book of Esdras, it is for the most part a transcript—and not a very accurate one—of Ezra and a portion of Nehemiah, together with the two last chapters of 2d Chronicles. It is impossible to ascertain anything regarding its age or authorship. Josephus quotes it extensively in his Antiquities, even when it contradicts *Ezra* proper, a fact which indicates that it was highly valued by the Jews. It may perhaps be interesting to notice that the hackneyed phrase, *Magna est veritas et prevalebit* (truth is great, and will prevail), is taken from the 41st verse of the 4th chapter of this book. The *second* book of Esdras, or Revelation of Esdras, is wholly different in character from the first, and it has even been doubted whether it is the work of a Jewish or of a semi-Christian writer. Lawrence and Hilgenfeld argue for its being composed 28–25 B.C.; Lücke, shortly after the death of Cæsar (44 B.C.); while Gfrörer, Bauer, and Wieseler assign it to a period as late as the reign of Domitian (81–96 A.D.). The opinion which has the weightiest evidence in its favor is, that the book was originally the composition of a Jew, but that it has been largely interpolated by Christian writers. The book was probably written in Egypt, and forms part of what has been called the "Apocalyptic Cycle" of Jewish literature (see REVELATION OF ST. JOHN). It consists of a series of angelic visions and revelations made to Ezra, regarding the mysteries of the moral world, and the final triumph of the righteous, who, however, are to be but "a very few." The descriptions are occasionally very striking, and even sublime, and if the doctrinal portions

contain the original views of a man living before the apostolic era, the source of the Pauline phraseology can in part be discovered.

ESENBECK'IA, a genus of trees of the natural order *diosmaceæ*. The bark of *E. febrifuga* is said to be equal in its effects to Peruvian bark. It is a tree 40 ft. high, a native of the s. of Brazil.

ESK (Gaelic, *uisg*, water), the name of several small Scotch rivers. The Dumfriesshire Esk is formed by the confluence of the Black and White Esk, which rise on the borders of Selkirkshire, near Ettrick Pen, the center of the southern Highlands, and run each 10 m. s.s.e. The united stream runs 35 m. s., and forms for a mile the boundary between Scotland and England. For the last 8 m. it runs s.s.w. in Cumberland, and finally falls into the head of the Solway firth. It flows in a Silurian, carboniferous, and Permian basin, through some charming scenery, past Langholm, Canobie, and Longton. The upper part of the valley of this E., which is wild and pastoral, is called Eskdale Muir.—The Edinburghshire North and South Esk rise in the n. of Peeblesshire, between the Pentland and Moorfoot hills, and both run n.n.e. through a beautiful tract in the e. of Edinburghshire, the n. branch, 20 m. long, passing Roslin and Hawthornden and the s. branch 15 m. long. The two branches unite in Dalkeith park, and run 3 m. n. into the firth of Forth at Musselburgh. The basin of the two streams is chiefly carboniferous.—The Forfarshire North and South Esk. The North Esk rises in the Grampians, in the n. of the county, and runs 25 m. s.e. into the sea, 4 m. n. of Montrose. At Ganachy bridge it runs half a mile through a sandstone gorge 20 to 30 ft. deep. In the lower half of its course it divides Forfarshire from Kincardineshire. The South E. rises in the Grampians of the w. of Forfarshire, and runs 40 m. s.e. and e., crossing the valley of Strathmore. It passes Brechin, and ends in the tidal basin or lagoon of Montrose. The basins of both consist of gneiss, mica-slate, clay-slate, and old red sandstone.

ESKAR, a term applied in Ireland to certain objects in the superficial drift, which occur in several parts of that country, and are not unknown in Scotland, but which are more abundant in Sweden than in any other known country, being there recognized as *ösar*. An *eskar* is generally a long linear ridge of rounded gravel, including pieces of considerable size; in Sweden they often have rough erratic blocks deposited upon them. It is an unsettled point whether they are connected with glacial action; if connected with it, the whole appearances and consistency demonstrate at least subsequent marine action. There is a remarkable E. on a moor spreading below Dirrington Law, in Berwickshire (900 ft. above the sea); another about a mile long, has been pointed out amidst a vast alluvial accumulation at St. Fort, Fifeshire.

ESKI-DJUM'NA, a t. of the principality of Bulgaria, is situated 20 m. w. of Shumla. Lat. 43° 15′ n., long. 26° 35′ east. Estimated pop. about 10,000.

ESKI-SA'GRA, a t. of European Turkey, in the province of eastern Roumelia, is situated at the southern base of the Balkan mountains, 70 m. n.w. of Adrianople. In the vicinity are numerous gardens and orchards, and also several mineral springs, which are in great repute. The manufactures are carpets, coarse linens, and leather. Pop. 15,000 to 20,000.

ESLA, a river of Spain, and an important affluent to the Douro, rises in the province of Palencia, Old Castile, from the southern base of the Asturias mountains, 10 m. n.w. of the town of Valleburon. Throughout the whole of its course, it flows s.w., and joins the Douro 15 m. below the town of Zamora. It is 125 m. in length. Its waters, which are joined by numerous streams, are well stocked with fish.

ESMERALDA, a co. in s.w. Nevada, on the California border, intersected by Walker river, and containing Walker lake, a large body of water having no known outlet; 7,850 sq.m.; pop. '75, 1288. There are gold and silver mines, but little agriculture, the land, where not mountainous, being arid plains. Co. seat, Aurora. The great salt basin, in this county, is covered with pure salt, and is 16 m. long and 3 m. wide.

ESMERALDAS (signifying *emerald* in Spanish) denotes a river, a town, and a province, all in the state of Ecuador (q.v.) in South America.—1. The river rises near the city of Quito, and enters the Pacific after a course of 110 m., in lat. 1° 5′ n., and long. 79° 40′ w.—2. The town stands 10 m. from the mouth of the river, containing about 4,000 inhabitants.—3. The province, watered by the above-mentioned river, occupies the n.w. of Ecuador. It is mostly covered with forests, but produces excellent cacao and tobacco. Pop. 8,000 to 10,000.

ES'NÉ, ESNA, or ESNEH, the hieroglyphic *Sen*, and the Greek *Latopolis* or *Latônpolis*—the city of the latus fish or *latus nobilis*, from the fish there worshiped—is a thriving but badly built town of Upper Egypt, and is situated on the left bank of the Nile, in lat. 25° 15′ north. It contains about 12,000 inhabitants, many of whom are Copts, and has some manufactories of fine cotton, shawls, and pottery. It is an entrepôt for the Sennaar caravans. There are famous ruins at E., which consist of a sandstone temple, with a portico of four rows of six columns, which appears to have been founded by Thothmes III., whose name is seen on the jambs of a door. The temple, however, seems to have been restored or principally constructed by Ptolemy Eurgetes (246–222 B.C.), and the pronaos was erected in the reign of the emperor Claudius (41–54 A.D.), and completed

in that of Vespasian. The interior is of the date of Trajan, the Antonines, and Geta, whose name, erased or replaced by that of Caracalla, is there found. The great temple was dedicated to Chnumis, Satis, and Har-Hek. It has a zodiac like that of Dendera, formerly thought to be of the most remote antiquity, but now known to be no older than the Romans. A smaller temple with a zodiac, erected in the reign of Ptolemy Eurgetes, formerly stood at E'Deyr, 2½ m. n. of E., but it has been destroyed. At E. is also a stone quay, bearing the names of M. Aurelius. This city was the capital of a nome, and the coins struck in it in the reign of Hadrian, 127–28 A.D., represent the fish latus.—Champollion, *Not. Descr.* p. 283; Wilkinson, *Mod. Egypt*, ii. p. 268; Tochon d'Annecy, *Médailles.*

ESO'CIDÆ, a family of malacopterous fishes, which is now regarded as including only the pikes (q.v.), but in which the flying fishes (*exocoetus*) and other fishes, now constituting the family *scomberesocidæ* (q.v.), and of the order *pharyngognaths*, were until recently included.

ESOP. See ÆSOP, *ante.*

ESOTER'IC (Gr.) is a term derived from the ancient mysteries, in which it was applied to those doctrines that were designed for the initiated, in contradistinction to those that were imparted to the uninitiated, which were termed *exoteric.* It is now used in various relations of an analogous kind.

ESPALIER, a term borrowed from the French, and signifying a railing on which fruit-trees are trained as on a wall. Such railings are very variously constructed—sometimes of wood, sometimes of iron, sometimes of upright rails held together by a horizontal rail at top, sometimes chiefly of horizontal rails with upright posts for their support. Espaliers may be very conveniently and cheaply made of strong iron wire, sustained by upright iron or wooden posts, as in ordinary wire fences. They vary in height from 4 to about 8 ft., according to situation and the size of the garden. They have the advantage of securing the fruit in a great measure from the effect of winds, which often shake off great part of the crop of standard trees whilst still unripe: and from the full exposure to sun and air, excellent fruit is produced, although there is no reflected heat as from a wall, which is therefore still superior. Espaliers are very common in gardens in Britain, and add at once to the beauty and the productiveness of a garden, the ground not being overshadowed as by standard trees, although, of course, the roots of the trees render it unsuitable for many crops to some distance on both sides of the espalier. Espaliers are often used to separate flower-borders from plots occupied by culinary vegetables. Apples and pears are considered more suitable for espaliers than any other kinds of fruit trees commonly cultivated in Britain. The treatment is generally similar to that of wall trees, but the training is usually by horizontal branches. It is not unusual, when trees have become old and their branches thick and firm, to dispense with great part of the rails necessary in their earlier training.

ESPARTE'RO, JOAQUIN BALDOMERO, ex-regent of Spain, count of Luchana, duke of Vittoria, etc., was b. in the year 1792, at Granatula, in La Mancha (Ciudad Real), where his father, Antonio Espartero, followed the occupation of a cartwright. E. was intended for the ecclesiastical profession, and in 1806 went to the university of Almagro, but two years later, on the invasion of Spain by the French, he entered the sacred battalion (*batallon sagrado*), so called from being composed almost entirely of students. After the close of the war of independence in 1814, he went to South America, where he fought against the insurgents; but after the victory gained by Bolivar at Ayacucho, Dec. 9, 1824, had put an end to the Spanish rule on the continent of America, E. returned to Spain. In 1832, he declared himself openly in favor of the succession of the daughter of Ferdinand VII.; and on the breaking out of the civil war after the king's death, he soon rose to the rank of lieut.gen. In Aug., 1836, he succeeded in saving the city of Madrid, and became successively gen.-in-chief of the army in the n., viceroy of Navarre, and capt.gen. of the Basque provinces. When the army of Don Carlos appeared before Madrid on the 12th Sept., 1837, E. had again the glory of saving the capital. His successful campaign of 1839, which resulted in the expulsion of Don Carlos from Spain, procured him the title of grandee of Spain, and duque de la Vittoria y de Morella. In 1840, the queen-mother, Christina, was compelled to resign her office of regent, and on the 8th of May, 1841, E. was appointed by the Cortes to supply her place until the queen (Isabella) should have reached her majority. E. guided the helm of the state with energy, firmness, and ability; but in 1843 an unscrupulous and unprincipled combination of parties naturally inimical to each other, the republicans and the moderados, brought about his fall. E. sailed for England, where he resided for four years. In 1847, he returned to Spain, and lived quietly at Logroño till 1854, when the wretched despotism and profligacy with which the name of Christina is associated, caused an insurrection of the people, and compelled the queen-mother to leave the kingdom. E. was again called to the head of the government, and conducted the affairs of the nation for two years; but in July, 1856, he was supplanted by gen. O'Donnell. In 1857, he resigned his dignity as senator, and after that time rarely took part in politics. After the revolution of 1868, which resulted in the expulsion of queen Isabella, E. gave his full and hearty adhesion to the provisional government, though he

took no part in their proceedings. In 1870, E. was induced to become a candidate for the throne of Spain; but withdrew in June of the same year, alleging his age and the division of parties as excuse. In 1875, he adhered to king Alfonso. He died in Jan., 1879.

ESPAR'TO, *Stipa* or *Macrochloa tenacissima*, a grass nearly allied to the well-known and beautiful feather-grass (q.v.), a native of the s. of Europe, and particularly abundant in some parts of Spain. It is much used by the Spaniards for making sandals, nets, sacks, etc.; and has become an important material in paper-making.

ESPE'JO, a small t. of Spain, in the province of Cordova, and 20 m. s.e. of the town of that name, is situated on the slope of a hill. It is comparatively well built, with wide and regular streets. It has an ancient castle of the duke of Modena Celi. E. has some manufactures of linen and woolen goods, and some trade in grain, cattle, and wool. Pop. 5,284.

ESPINASSE, JULIE JEANNE ELEONORE DE L', one of the most fascinating women of her time, and one who combined sparkling gifts with a heart susceptible of the strongest affections, was b. at Lyons, 19th Nov., 1732, and was the illegitimate daughter of a Mme. d'Albion. After the death of her mother, Mlle. de l'E., who had received an excellent education, went to live at the house of her brother-in-law, the marquis de Vichy-Chamroud, in whose family she held the position of *gouvernante*. In 1752, she left her brother-in-law's house, and went to Paris in the quality of *demoiselle de compagnie* to the marquise Du Deffand (q.v.). The two ladies lived together for a time most agreeably, until it became evident that the charms of the young and beautiful *demoiselle* had enlisted on her side the admiration of the circle in which Du Deffand had formerly been the chief attraction. Even D'Alembert, the famous encyclopédist, who hitherto had been the most constant admirer of Du Deffand, now manifested an entire devotion to the younger and more fascinating Espinasse. A rupture between the ladies was the consequence. The friends of E., however, obtained for her, through the duc de Choiseul, an annuity from the king. It is said that D'Alembert sought her hand in vain. She died 23d May, 1776. Her *Lettres*, etc. (Paris, 1809), bear witness to her remarkable cultivation.

ESPINEL, VINCENT DE, a Spanish poet and musician, was b. at Ronda in Granada, 28th Dec., 1551. He studied at Salamanca, afterwards entered into the army, and traveled as a soldier through a great part of Spain, France, and Italy, meeting with the adventures which he relates in his *Relaciones de la Vida y Aventuras del Escudero Marcos de Obregon* (Madr. 1618, later 1804; in German, by Tieck, Bres. 1827). He afterwards returned to his native country, entered into holy orders, and received a benefice in Ronda, his native town. He was subsequently chaplain in the royal hospital at Ronda. The last years of his life were spent at Madrid, in the retirement of the monastery of *Santa Catalina*, where he died in 1634. He published a book of poems (Madr. 1591), containing chiefly lyrics, and a translation of the *Epistola ad Pisones*, the *Ars Poetica* of Horace. He was, if not the inventor, the improver of the ten-line octosyllabic stanza. Verses written in this form have, since E.'s day, been called in Spain *Espinelas*. He was a performer on the guitar, to which he added the fifth string.

ESPINHA'CO (SERRA DO), a mountain-chain of Brazil, extends in a direction generally parallel with the coast, from the right bank of the San Francisco to the head-waters of the Uruguay. Its northern part forms the eastern limit of the basin of the former river. The Serra, as a whole, is said to be rich in diamonds.

ESPIR'ITU SANTO, besides having been long applied by the Spaniards to their imaginary continent in the southern hemisphere, denotes various actual localities.—1. E. S. is a small maritime province of Brazil, extending in s. lat. from 18° 30′ to 21° 20′, and lying immediately to the n. of the metropolitan province of Rio Janeiro. This province contains also a town and a bay of its own name.—2. E. S. is the largest and most westerly island of the New Hebrides, being in lat. 15° s., and long. 167° east. It is said to measure 80 m. by 40.—3. E. S. is a cape of Tierra del Fuego, in lat. 52° 38′ s., and long. 68° 37′ west.—4. E. S. is a considerable town near the center of Cuba. It contains about 9,982 inhabitants, fully one half being whites.—5. E. S. is a bay of the gulf of Mexico, forming part of the almost continuous back-water of Texas. It is in lat. 28° 30′ n., and long. 97° 30 west. Towards the open sea, it is breasted by Matagorda island, and on the side of the mainland, it receives the Guadaloupe.

ESPLANADE' (in fort.) is the open space intentionally left between the houses of a city and the glacis of its citadel. It requires to be at least 800 paces broad, that the enemy, in case of his getting possession of the town, may not be able to assail the citadel under cover of the nearest houses. For this purpose, the citadel must command the E., and be able to send a direct fire into the streets opening upon it. In old works on fortification, the term is often applied to the glacis of the counterscarp, or the slope of the parapet of the covered way towards the country.

ESPOUSAL. 1. Among the Jews, the ceremony of betrothal or of engagement to be married. It was entered into a year or more before marriage, and consisted in giving and receiving before witnesses, either a piece of silver as a pledge, or a written contract wherein the bridegroom bound himself to give a certain sum as a portion to the

bride. From the time of espousal the woman was considered as the lawful wife of the man to whom she was betrothed. 2. In the early Christian church also, a ceremony of espousals preceded marriage. The preliminaries consisted in a mutual agreement between the parties that the marriage should take place within a limited time, confirmed by certain donations as the earnest of marriage, and attested by a sufficient number of witnesses. The free consent of parties contracting marriage was required by the old Roman law and by the code of Justinian. The gifts bestowed were publicly recorded. The dowry settled on the bride was stipulated in public instruments under hand and seal. The ring was given at the betrothal rather than at the actual marriage. The use of the marriage ring has been traced to the 10th c., its recognized place being then as now on the woman's fourth finger. The witnesses present, friends of both parties, were usually ten in number. The espousal, as incorporated with the wedding-rite, is plainly traceable in the usages of the Roman, Anglican, and other churches at the present day.

ESPRINGAL, or SPRIN'GAL, in the military engineering of the days before the introduction of gunpowder into European warfare, was a machine for throwing missiles. These missiles were either large darts called *muchettes*, or arrows winged with brass, and called *viretons*, from their whirling motion when shot forth.

ESPRIT D'IVA, an aromatic liquor made in Switzerland, from a plant called GENIPI (*achillæa moschata*, or *ptarmica moschata;* see ACHILLÆA). Like the *Swiss tea* made from the same plant, it possesses sudorific properties.

ESPY, JAMES P., one of the most original and able meteorologists of the present century, was the son of a farmer in western Pennsylvania, where he was b. in 1784 or 1785. He received a superior education, and, during he earlier part of his career, was one of the best classical and mathematical instructors in Philadelphia. E.'s attention was first strongly turned to science by the writings of Dalton and Daniell on meteorology. After some time, his enthusiasm became so great, that he resolved to give up teaching, and to rely for the means of prosecuting his meteorological researches upon his slender savings and the success of his lectures on the subject, which, fortunately, turned out to be far more attractive than the average of popular lectures. His first course was delivered before the Franklin institute of Pennsylvania. E.'s theory of storms (with which his name is specially connected) drew general attention to itself, especially in the United States. See STORMS. A memoir on this subject gained for him, in 1836, the Magellanic premium of the American philosophical society of Philadelphia. In 1841, appeared his work on the *Philosophy of Storms*, regarding which the report of the *Académie des Sciences* (Paris) says, "that the theory on which it is based alone accounts for the phenomena. . . . In a word, for physical geography, agriculture, navigation, and meteorology, it gives us new explanations, indications useful for ulterior researches, and redresses many accredited errors." Later in his life, E. became professor in the Philadelphia high school, and afterwards in the Franklin institute of that city, He traveled extensively through the United States, lecturing on his favorite theory of storms, and studying the laws of climate, until he acquired the popular title of the "storm-king." After the organization of the Smithsonian institution at Washington, he was commissioned by Dr. Henry, its superintendent, to pursue his researches. It was in the halls of the Smithsonian that his experiments on the rate of cooling of gases of different densities when expanded were made. The cooling effects of expansion on dry and moist air also formed the subject of nice experiments. The results of these experiments have thrown much light on the formation of cloud and rain, and the propelling power of winds. They afforded materials for his elaborate and valuable reports on meteorology, presented to the senate of the United States. Four of these reports were published at the expense of government. The last was issued in 1857, which embodies all his matured opinions on meteorological phenomena. This is one of the most valuable works on the principles of the science. He d. in Cincinnati, Ohio, 24th Jan., 1860, at the residence of his nephew.

ESQUIMAUX, or ESKIMOS, is the name of a nation inhabiting the coasts of all the seas, bays, inlets, and islands of America n. of the 60° of n. lat.; from the eastern coast of Greenland, in long. 20°, to the strait of Behring, in long. 167° west. On the Atlantic, they are to be found along the entire coast of Labrador to the strait of Belleisle, and down the e. side of Hudson's bay nearly as far as James's bay; while on the Pacific they reach as far as the peninsula of Alaska. They are also to be met with on the Asiatic side of Behring's strait, and, though few in number, may be regarded as the most widely spread nation in the world, occupying, according to Mr. Gallatin, not less than 5,400 m. of coast, without including the inlets of the sea. "The Eskimo," says Dr. Latham, "is the only family common to the old and new world—an important fact in itself, and one made more important still by the Eskimo localities being the only localities where the two continents come into proximity." Nothing, however, has as yet come out of a consideration of this fact in the way of tracing, with absolute certainty, a connection between the E. and any well-defined Asiatic race. The name itself, *Esquimaux* or *Eskimo*, does not help us in any such attempt, being from an Algonquin or Abenaki word, signifying "eaters of raw flesh." This is not the native name, for they call them-

selves "Inuit," or "people;" the Scandinavians of the 10th c. called them "Skroellingar," or "wretches;" while the seamen of the Hudson's bay ships designate them as "Seymos," or "Suckemos"—appellations, according to Richardson, "evidently derived from the vociferous cries of Seymo or Teymo with which the poor people greet the arrival of the ships." The E. are usually reckoned by ethnologists to belong to the Mongolian race, but Duponceau and Gallatin find a strong resemblance between them and the red Indians of North America, which is the view also taken by Prichard—the last mentioned regarding them as a kind of link between the northern Asiatic and American family of nations. Latham, on the other hand, pronounces them to be Mongolian in physiognomy, with flat nose, projecting cheek-bones, eyes often oblique, and skin more brown than red or copper colored; thus presenting a marked contrast to the North American Indians. Their language, however, is, he acknowledges, American in respect to its grammatical structure, being composed of long compound words, and regular, though remarkable, inflections. With respect to the complexion of the E., sir John Richardson is of a different opinion from any of these authors, describing it as nearly white, when relieved from the smoke and dirt with which it is usually incrusted. Many of the young women, he considers, may even be called pretty, when this operation has been performed. "The young men," he says, "have little beard; but some of the old ones have a tolerable show of long gray hairs on the upper lip and chin, which the red Indians never have, as they eradicate all stray hairs. The Eskimo beard, however, is in no instance so dense as a European one." In stature, the E. are usually represented as not being more than 5 ft. in height; but the authority just mentioned describes them as ranging from 5 ft. to 5 ft. 10 in., and even more. They are broad-shouldered, and, when seated in their boats, look tall and muscular, but, when standing, appear to lose some of their height, from the shortness of their lower extremities. The E. live usually throughout their long lines of coast in small villages, containing about five or six families each. The men occupy themselves entirely in hunting, while the women perform the domestic drudgery, which consists principally in preparing the food, of which both sexes consume a large quantity. This is almost entirely of an animal nature, but not without variety, embracing the reindeer, geese and other birds, the seal, walrus, salmon-trout, and various other kinds of fish. They are expert hunters and fishers, and, aided by their dogs, make considerable havoc among the arctic animal tribes. Where whales are common, Aug. and Sept. are devoted to the pursuit of these animals, and great joy is manifested when they capture any of them, as from the blubber of these they get their supply of oil for lights in the long winter season. Of vegetables, they scarcely taste any except in the autumn. "Carbon is supplied to the system by the use of much oil and fat in the diet, and draughts of warm blood from a newly-killed animal are considered as contributing greatly to preserve the hunter in health." The habits of the E. are filthy and revolting in the extreme. A great part of their food is consumed without any attempt at cooking it, and they drink the blood of newly-killed animals as the greatest delicacy that could be offered them. In the short summer, those who can afford it live in tents; but in the winter they all equally live in snow-huts, the stench of which, from the offal with which they are stored, and the filthy oil that gives them light, makes them insupportable to the European. The dress of both sexes is nearly the same, consisting of the skins of animals, reindeer, birds, and even fish—whatever conduces most to warmth, without much regard to appearance; but in their winter abodes they usually wear nothing except trousers. Their religion consists principally in superstitious observances, but they believe, we are told, in two greater spirits, and many lesser ones. The Moravian mission in Greenland, commenced by the benevolent Hans Egede (q.v.), in 1721, has succeeded in converting many of them to Christianity; and they are represented by the missionaries to be a mild and teachable people, easily led by kindness to distinguish between what is morally right and wrong. Where the missionaries, however, have not penetrated, our arctic voyagers generally speak of them as honest among themselves, but incorrigibly dishonest, and prone to lying and exaggeration with strangers.—See Dr. Rink's *Tales and Traditions of the Eskimo*.

ESQUIMAUX DOG, a kind of dog extensively spread over the most northern regions of North America and of eastern Asia; large, powerful, with long rather curling hair, tail much curved over the back and very bushy, short and pointed ears, and somewhat wolf-like aspect. These dogs are much used for drawing sledges. They are very sagacious, docile, and patient. The color is generally black and white, brown and white, or dingy white.

ESQUIN TLA, or **ESCUINTLA**, a t. of the state of Guatemala, Central America, 25 m. s. from Guatemala, on the river Michatoya, which falls into the Pacific ocean. It has a fine church. Pop. 6,000, consisting in great part of Indians.

ESQUI'RE (Fr. *escuier*, a shield-bearer, from Lat. *scutum*, a shield). The E. in chivalry was the shield-bearer or armor-bearer to the knight, and hence was called *armiger* in Latin. He was a candidate for the honor of knighthood, and thus stood to the knight in the relation of a novice or apprentice, pretty much as the page did to him. In this capacity he was spoken of as a bachelor, just as the knight-bachelor came latterly to be distinguished from him who had already attained to the higher honors of

chivalry. When fully equipped, each knight was attended by two esquires. The E. was a gentleman, and had the right of bearing arms on his own shield or escutcheon, which is surmounted by a helmet placed sideways, with its visor closed, to distinguish him from a knight or nobleman. He had also the sword, the emblem of chivalry, though he was not girded with the knightly belt. His spurs were silver, to distinguish them from the golden spurs of the knight; and when the king created esquires of old, it was by putting silver spurs on their heels, and collars of SS round their necks. Those who received this honor directly from the sovereign were in general the esquires for the king's body, or those whose duty it was to attend him in his capacity of a knight; an office now nearly obsolete. Tenants of the crown who held by knight's service were a class of feudal esquires generally supposed to correspond to the simple *ritters* or knights of Germany, as opposed to the *ritters* who were *geschlagen* or dubbed, inasmuch as these English esquires were entitled to claim the rank of knighthood. Though the title of E. has now come to be given without discrimination to all persons above the rank of a tradesman or shopkeeper, the following seem to be those whose claim to it stands on the ground either of legal right or of long-established courtesy: 1. All the untitled sons of noblemen; 2. The eldest sons of knights and baronets; 3. The sons of the younger sons of dukes and marquises, and their eldest sons. All these are esquires by birth. Then there are esquires by profession, whose rank does not descend to their children; and esquires by office—e.g., justices of the peace—who enjoy the title only during their tenure of office. To the former class belong officers in the army and navy, barristers, and doctors of law, and doctors of medicine, but not surgeons.

ESQUIROL, JEAN ETIENNE DOMINIQUE, one of the greatest physicians for the insane of modern times, was b. at Toulouse, 4th Jan., 1772. He served in the military lazaretto at Narbonne in 1794, obtained his degree of doctor in 1805, and was appointed physician to the Salpêtrière at Paris in 1811. After 1817, he delivered clinical lectures on the diseases of the mind, and their cures; in 1818, his exertions secured the appointment of a commission, of which he became a member, for the remedy of abuses in madhouses; in 1823, he became inspector-general of the university; and in 1825, first physician to the *Maison des Aliénés*. In the following year, he was also appointed principal physician of the private lunatic asylum at Charenton, which he had organized with admirable skill. At the July revolution, he lost all his public offices, and withdrew into private life. He died 12th Dec., 1840. E. combined, in a truly rare and wonderful manner, the qualifications requisite for a physician of the body and a physician of the mind. By his humane and moral treatment of the insane, he often effected the happiest cures. His writings embrace all the questions connected with the treatment of insanity. E. also paid great attention to a very important subject, viz., the construction of suitable buildings for the insane; and most of the modern lunatic asylums in France, such as those of Rouen and Montpellier, have been built according to his advice. His most important work is *Des Maladies Mentales considérées sous les Rapports, Médical, Hygiénique et Médico-légal* (1838).

ESQUIROS, HENRI ALPHONSE, a poet and romancist of France, a representative in the national assembly, was b. at Paris in 1814. He made his *début* as an author in 1834, when he published a volume of poems, entitled *Les Hirondelles*, which, although highly praised by M. Victor Hugo, had but a very limited sale. *Les Hirondelles* was followed by two romances, *Le Magicien* (1837) and *Charlotte Corday* (1840). About this time he also published a philosophic and democratic commentary on the life of Christ, under the title of the *Evangile du Peuple* (1840). For the publication of this work, E. was prosecuted, and sentenced to 8 months' imprisonment and to a fine of 500 francs, 30th Jan., 1841. In the same year he published his *Chants d'un Prisonnier*. He also wrote three little works between 1841 and 1842—these were *Les Vierges Martyres*, *Les Vierges Folles*, and *Les Vierges Sages*. His *Histoire des Montagnards* appeared in 1847. After the revolution of Feb., 1848, E. was elected a member of the legislative assembly. Distinguished by his radical opinions, he was included, after the 2d Dec., 1851, among the number of members to be expelled; on which he retired to England. His *La Vie Future au Point de Vue Socialiste* appeared in 1857; and his *La Morale Universelle*, his *L'Angleterre et la Vie Anglaise*, and his *La Neerlande et la Vie Hollandaise* in 1859. In 1869, he was returned to the corps legislatif for the fourth circumscription of the Bouches du Rhone; and was appointed supreme administrator of that department by the government of the national defense in 1870. In 1871, he was returned to the national assembly, and in Jan., 1876, was made a member of the senate. He died 13th May, 1876, at Versailles.

ESS, HEINRICH LEANDER VAN, or JOHANN HEINRICH, 1772–1847; b. Westphalia; educated in the Dominican gymnasium of Warburg; a Roman Catholic priest from 1797 to 1812; and then professor of theology in the Marburg seminary. In 1807, he published the New Testament in German, but its circulation was forbidden by the pope. The next year he published a defense of his views, advocating the reading of the Bible by the people. In 1816, he published *What was the Bible of the first Christians?* and in 1818, *The Bible not a Book for Priests*. In 1840, he completed a German translation of the entire Bible. His library of 20,000 volumes, unusually rich in early editions of the con-

troversial works of the period of the reformation, was purchased after his death, and given to the Union theological seminary in New York.

ESSAYS AND REVIEWS, by six clergymen and one layman of the church of England (the Rev. Drs. Frederick Temple and Rowland Williams, prof. Baden Powell, H. B. Wilson, Mark Pattison, prof. B. Jowett, and Mr. C. W. Goodwin), were published in an 8vo. vol. in Mar., 1860. The book did not excite much attention at first, but having been severely censured for heterodox views by nearly all the bishops and many of the clergy, it created much excitement in 1861, and was condemned by convocation June 24, 1864. The ecclesiastical courts sentenced the Revs. R. Williams and H. B. Wilson to suspension for one year, and costs, Dec. 15, 1862; but on appeal the sentenced was reversed by the judicial committee of the privy council, Feb. 8, 1864. The most remarkable among the works put forth in opposition (in 1862) are the *Aids to Faith*, edited by the bishop of Gloucester (W. Thomson, now archbishop of York), and *Replies to Essays and Reviews*, edited by the bishop of Oxford (Samuel Wilberforce). The appointment of Dr. Temple to the see of Exeter was much opposed on account of his essay in this collection.

ESSAAD-EFFENDI, MOHAMMED, a Turkish historian, was b. at Constantinople, 16th Dec., 1790. He was surnamed Sahaf-Zadeh, "son of the bookbinder," on account of his father having been president of a corporation of bookbinders and librarians. At the age of 18, he became a teacher; in 1825, he was appointed historiographer to the Ottoman empire. In 1831, the superintendence of the *Tatawin-i-wekaii* (Table of Events), the official journal of the empire, was placed in his hands. In 1835, he was employed by the late sultan Mahmoud on an embassy to Mohammed, the son and successor of the king of Persia. E. had also the titles of grand judge of Roumelia, inspector-general of schools, and member of the council of public instruction.

The works of E. comprise, among others, the *Uss-i-Tzafer* (the Establishment of Victory), a work which has been translated into French, and published by M. Causin de Perceval, with the following title: *Historic Summary of the Destruction of the Janizaries by the Sultan Mahmoud in* 1826 (Par. 1833).

ESSEG. See ESZEK (*ante*).

ESSEN, a t. in Rhenish Prussia, situated between the Rhur and the Emscher, 20 m. n.e. of Düsseldorf, stands in the midst of a rich coal and iron district. The town is surrounded by the high chimneys of the steam-engines used in working the mines. As it has risen only very recently to its present importance, its architectural beauties are not great; it has, however, an imposing cathedral, containing many curious reliquaries, crosses, etc. E. owes its prosperity to the inexhaustible coal-mines in its vicinity. Owing to this, there are in the neighborhood extensive works for all sorts of manufactures in iron. The enormous works of Herr Krupp, the discoverer of the method of casting steel in very large masses, who employs about 14,000 men, are at Essen. At them are manufactured many articles for peaceful purposes; but the gigantic steel guns which the Germans used with such terrible effect at the siege of Paris (1870–71) have made the name of Krupp world-renowned. In 1872, 125,000 tons of steel were cast. Pop. '75, 54,852. Although the industrial activity of E. is only of recent growth, the town itself is very old, and can trace its origin to the famous Benedictine nunnery of the same name, founded in 873 A.D.

ESSEN, HANS HENRIK, Count, 1755–1824; b. Sweden; educated in the state university; accompanied Gustavus III. in his travel abroad. He attended the king at the masked ball where the latter was assassinated by Anckarstroem, Essen having warned Gustavus of a probable attempt on his life. In later years, Essen was governor of Stockholm, governor-general of Swedish Pomerania and Rügen, and in 1807, commander of the Pomeranian army, distinguishing himself by the defense of Stralsund. Still later he was a member of the council, and ambassador in Paris. After the union of Sweden and Norway he was appointed governor of the latter country, and in 1817, governor-general of Scania.

ESSENCE, in philosophy (from esse, to be), is that which constitutes the particular nature of a being or substance, or of a genus, and which distinguishes it from all others. Locke's statement, that E. may be taken for the very being of a thing, whereby it is what it is, agrees with this definition. He makes, also, a distinction between nominal and real E., saying, for example, that the nominal E. of gold is the complex idea expressed by the word; and that its real E. is the constitution of its insensible parts on which its properties depend and which is unknown to us. In theology, Athanasius and other Greek writers distinguish *ουσια* (essence or substance), denoting what is common to the Father, Son, and Holy Spirit, from *ὑποστασιρ*, denoting what is individual, distinctive, and peculiar. In modern writers, essence and substance are generally used as virtually synonymous, and representing, in any object, all that the human mind cannot know, while all that can be actually known is called quality or accident. As both terms are often vaguely employed, it is necessary, wherever they occur, first of all to ascertain the sense in which the writer intends them to be understood.

ESSENCE DE PETIT GRAIN is obtained by distillation from small unripe oranges, about the size of a cherry, and is used as a perfume in the same manner as *orange-flower water*.

ESSENCES are solutions of the essential oils in alcohol, and may be prepared (1) by adding rectified spirit to the odoriferous parts of plants, or to the essential oils, and distilling; or (2) simply by adding the essential oil to the rectified spirit, and agitating till a uniform mixture is obtained. Thus, the essence of lemons is merely a solution of the volatile oil of lemons in rectified spirit. This term is frequently used as synonymous with volatile oils.

ESSE'NES (*Essēnoi, Essaioi*), a small religious fraternity among the Jews, whose name and origin, as well as character and history, are alike involved in obscurity. Still, in the wide field of the history of the Semitic religions, there are not many subjects of inquiry of greater importance, or calculated to inspire a deeper interest. The E. bore one of the most momentous parts in the development of Judaism. Christianity stands in so close connection with them, that John the Baptist and Christ himself have been pronounced to have originally issued from their ranks. More surprising than all, out of Essenism, in the stage of Sabæism, has sprung Islam itself, and in this last development of its tenets and practices are still preserved some of its principal rites. It is but natural that from the days of the fathers to our own, an infinite number of writers, more or less qualified for the task, should have endeavored to throw light on this mysterious brotherhood, but with success far from satisfactory. The reason of this is obvious enough. Josephus, Philo, Pliny, Solinus, Eusebius, and the fathers generally, were considered the sources, and the only sources, from which the genuine history of this fraternity could be deduced. Of these, Pliny indeed has a geographical notice, which cannot be traced to either Philo or Josephus; but the rest have so evidently derived their shallow and contradictory accounts indirectly, and through corrupted channels, from those two writers, that they lose all claim to consideration. Of the two books of Philo in which information regarding the E. is contained, one (*De Vita Contemplativa*) is proved to have been written about three centuries after Philo's death by a Christian monk as a penegyric on ascetic monachism. The other (*Quod Omnis*) is, to say the least, of doubtful genuineness, and is, moreover, at variance with Josephus. As to Josephus himself, it is now pretty generally allowed that his E. stand in much the same relation to the historical E. as the ideal inhabitants of the *Germania* of Tacitus stand to the real Germans of his time. Strange that for so many centuries the real and genuine sources—the Talmudical writings—should never have been thought of. These, *together* with Josephus and Philo, Pliny, and the Arabians Macrisi and Abulfarag, will perhaps better enable us to form an idea, not only of the real state of this community, but, what is of no less moment, to trace the process by which they gradually arrived at their peculiar mode of life and worship. We need not remind the reader that we must strictly confine ourselves here to an epitome of facts and conclusions.

We have to premise, that exception must at the outset be taken to the opening statement of Josephus, that there were three different "sects" among the Jews: the Pharisees, the Sadducees, and the E.—a statement which has been copied and accepted from that day to the present. The Sadducees were a political party, nothing more or less, and, as a matter of course, held religious views antagonistic to, or rather they did not accept the traditions of, their adversaries, the Pharisees, who, again, forming as they did, the bulk of the nation, cannot rightly be called a *sect*. Least of all were the E. such. They were Pharisees of stronger convictions, and carried out the Pharisaic views with a consistency which made them ridiculous even in the eyes of their own mother-party (Sota, 26, a.); neither were they known by the names of E., this being a very late designation, derived either from a Chaldee word *sacha*, and meaning bathers, or baptists; or from *asa*, meaning healers. The Mishna, Beraitha, and Talmud speak of these advanced Pharisees in general as Chasidim (*Assidaioi*, pious men), Nazirim abstinents), Toble Shachărith (hemerobaptists), Banai (builders), and Chaberim (friends). The Arabic book of *Maccabees* calls the E. simply *Assidaioi*, and Macrisi speaks of "Nazirs, Essenes, and Baptists" as *all* being "Asaniun," or Essenes.

The Nazirhood, a kind of voluntary priesthood, enjoining abstinence from wine, flesh, and other sensual enjoyments, had, in the troublous times of anti-Syrian agitation, and the general upheaving of society, found numerous adherents (*Tosifta Nazir.* c. 4; *Talm. Babli Berach.* 48, a. 1; *Macc.* ii. 49; Jos. *Antiq.* xviii. 1); and gradually there sprang up (contrary to the Bible, which restricts this asceticism to a certain period) a host of men calling themselves "Nazirs forever"—Nazire olam (*Nazir* 4, a.). Pharisees of a spiritual and contemplative bias, with no natural taste for the conflicts and activity of political or public life, or wearied, perhaps, with the vanity of human aims, took this vow of Nazirship for life, and constituted themselves into a sort of religious club. Levitical purity in its strictest and highest sense made them draw closer and closer the innumerable "*fences*" which the traditional law had erected round the biblical law. Any one, friend or foe, could, at any moment, by having touched something impure, disturb this purity for the time, and necessitate new and endless purifications. Thus it became necessary, or at least expedient, that those among them who could break all ties of friendship and family, should retire into a solitude not easily approach

able by a stranger to their community. Food, again, could not be prepared save by those of the brethren who knew and strictly obeyed the hyper-traditional injunctions. Their dress, every implement of daily use, had to be made under similarly stringent laws of purity. A natural consequence of this their exalted notion of outward priesthood, was—the different phases of woman's life taken into consideration—their general celibacy. (The explanation given by Josephus—the fear of the corruption of both towns and women—is entirely gratuitous, and utterly in discordance with the Jewish notions of the time.) In this state of voluntary isolation, trading was out of the question; they tilled the ground, and lived on the fruits of the earth. Taking their meals, and these of the coarsest and plainest description, in common, they idealized the table into an altar, and, prayer having been said, they remained standing silently round it during the repast. That they had no individual property, follows of course, and their communistic motto, which the Mishna (Aboth) has preserved to us—"Mine is thine, and thine is mine"—explains itself. We need not enlarge further on their small eccentricities—on the white linen garment, the apron (kenaphaim), the scoop or shovel; they are, one and all, signs and symbols of Levitical purity, the scoop reminding us of a certain Mosaic ordinance during the wanderings in the desert, the apron becoming necessary from the frequent ablution of their hands. Every morning, they bathed, like the priests who ministered in the temple, in pure spring water. They abhorred blood as a source of impurity, and for this reason, probably, some of them abstained also from going up to the temple, where sacrifices were daily offered; others we find present at a festival in the temple (Succah, 51, 53). Their offerings were sent alive under the care of messengers. But these were but outward signs of purity, stepping-stones to inner piety, to communion with God, which was only to be acquired, according to their notion, by solitude and an ascetic life. The belief in the efficacy of the most rigid simplicity and willing self-sacrifice, they held in common with the Pharisees; their horror of oaths, their frequent prayers, their occupation with mystical doctrine, were their own. Untroubled by the noise of war or the strife of parties, leading a life divided between the bath, ablutions, contemplation, and prayer; despising the body and bodily wants; what more natural than that by degrees they should be led into a kind of mystical enthusiasm and fanaticism. They allegorized, they symbolized; and their efforts culminated in seeing the unseen. Absorbed in the attempt to fathom the mysteries of the nature of God, one of their principal occupations was the study of the name of God; of that unpronounceable name which only the high-priest dared utter once a year in the holy of holies during the most awful and solemn service on the day of Atonement. The knowledge of that name in four, in twelve, and in twenty-four letters, would give them the power of prophecy and of "receiving the Holy Ghost."

Angelology, derived from the Magi, formed a prominent feature of their creed. In course of time, they were looked upon by the vulgar as saints and workers of miracles. A wonderful book of cures (*Sepher Refuoth*), which Talmudic, Arabic, and Byzantine authorities alike ascribe to Solomon, was in their hands, and with this, "by the aid of certain roots and stones," by the imposition of hands, and certain whisperings—a practice strongly condemned by the Pharisees (Synhedr. 90, a.)—they cast out demons, and healed the sick. Philosophy they regarded in so far only as it treated of the existence of God. Jehovah is the original light; from him proceed a number of spirits (the Platonic ideas). and at their head stands the wisdom, or *logos*, into which, after death, the soul is again absorbed. Their code of ethics was threefold—the love of God, of virtue, and of man; their scale of perfectibility reaching its acme in the communion with the Holy Ghost (*Ruach Hakodesh*), (Mishn. Sota, 99). In fine, mixing up, in the strangest manner, the most exalted and the most puerile notions, they became the forerunners of the Christian Gnostics and of the Jewish cabalists, and, it may be, of many secret, still existing orders, who may have derived from this source their ceremonies and the gradations of initiation.

They seem never to have numbered more than 4,000, including even those Nazirs or E. who remained in their own families. Their colony appears to have been established chiefly near the Dead sea, and it is undoubtedly this colony which has served Josephus as a basis to his romantic E. republic. But, however distant from each other they might be, a constant intercommunication was kept up through a body of delegates, or angels (Malachim). As they had sprung from the Pharisees, so they again merged into them—part of them, we should rather say; the remaining part became Therapeutæ, or Christians. See THERAPEUTÆ and JEWISH SECTS. The Talmud gives a distinct account of their ceasing to exist as a separate community (Bechorot, 27), and so soon after their extinction did they fall into oblivion, that in the third century we find a Jewish sage asking who *these Hemerobaptists* had been (Berachot, 22, 1).

Much has been written and said of a certain literature which they possessed; on this we are unable to decide, deprived as we are of all trustworthy authority. One fragment only remains; it is quoted in the Talmud (Jerusch. Berachoth. End) in the following words: "It is written in the book of the *Chasidim*, If thou leavest it (the divine law) for one day, it will leave thee for two."

In addition to the Talmud and Midrash, we refer the reader to Joseph. *Antiq.* xv. 10, xviii. 1, *Jew. War*, ii. 7, 8; Philo, *Quod Omnis Prob. lib.* § 12; Plinius, *Hist. Natur.* v. 17; Epiphan. *Hæres.* xxix.; Hieron., Cyrill., Chrysost., etc. Beckermann, *Ueber die*

Ess. (1821); the histories of the Jews by Iost, Ewald, and Grätz; articles by Franckel; Sprenger's *Leben Mohammad's* (1861); and Leutbecher's *Die Essäer* (1857).

ESSENTIAL OILS. See OILS.

ESSEQUI'BO, the most westerly of the great rivers of British Guiana, rises in the Acarai mountains, 41 m. n. of the equator, and after a course of 620 m. enters the Atlantic near the Venezuelan frontier, forming an estuary 20 m. wide, in which lie numerous fertile islands. The E. receives numerous large tributaries, as the Cuyuni and Mazaruni; on the Potaro, another affluent, is the magnificent Great Kaietur fall, above 700 ft. in sheer descent, discovered in 1870. On the banks of the E. are forests of locust-tree, iron-wood, ebony, greenheart, and other fine timber trees, festooned with orchids, and laced together with lianas and other climbing plants. Beyond the forests are vast savannahs, formerly forests destroyed by fire, and now swamps of brushwood, reeds, and coarse grass. The E. is navigable for large ships to the first cataracts, about 60 m. from the sea. The co. of E. has not prospered so much as Demerara and Berbice. Many of the old plantations are out of cultivation. Pop. 27,000, exclusive of about 2,000 Indians.

ESSES, COLLAR OF, a chain-like collar, composed of links in the shape of the letter S; found in various old insignia of England. It is said to have been worn by esquires especially. Some claim the SS to be the symbol of Saint Simplicius.

ESSEX, a co. in n.e. Massachusetts on the New Hampshire border and the ocean, traversed by the Merrimack and Ipswich rivers, and the Boston and Maine, the Eastern, the Salem and Lowell, the Danvers and Newburyport, and some other railroads; 520 sq.m.; pop. '75, 223,342. It has a rugged and uneven surface, and its business is mainly in manufactures of cotton, wool, leather, etc. There are quarries of granite and syenite. There are six cities or large towns in the co., and it has three co. seats, Salem, Newburyport, and Lawrence.

ESSEX, a co. in n.e. New Jersey, almost encircled by the Passaic river, and bordering on Newark bay; intersected by the New Jersey, the Morris and Essex, and the Paterson and Newark railroads; 150 sq.m.; pop. '70, 143,839. The soil is fertile; but besides market gardening there is little of agriculture, the people being mostly engaged in manufactures. Co. seat, Newark.

ESSEX, a co. in n.e. New York, w. of lake Champlain, on the head waters of the Hudson, and intersected by Au Sable river, and the Champlain division of the Delaware and Hudson canal company's railroad; 1926 sq.m.; pop. '75, 34,374. In the w. part of this co. are the highest peaks of the Adirondacks, covering a large region entirely unsettled. The soil is fertile. There are beds of magnetic iron ore, and a number of extensive iron works. There are nearly 100 lakes, large and small, in the county. Co. seat, Elizabethtown.

ESSEX, the n.e. co. of Vermont, between the Connecticut and Passumpsic rivers, crossed by the Grand Trunk railway; 790 sq.m.; pop. '70, 6,811. It is a rough and cold region, not favorable to the growth of cereals. There are very large forests of sugar maple. Co. seat, Guildhall.

ESSEX, a co. in e. Virginia, bounded by the Rappahannock, which is navigable; 270 sq.m.; pop. '70, 9,927—6,650 colored. The surface is uneven, and the soil for the most part sandy. Co. seat, Tappahannock.

ESSEX, a maritime county of the s.e. of England, having the North sea on the e.; the Thames estuary, dividing it from Kent, on the s.; Middlesex and Hertford on the w.; and Cambridge and Suffolk on the north. Its greatest length from n.e. to s.w. is 63 m., and the greatest breadth from e. to w. is 54 miles. It has 1,055,161 statute acres, nine-tenths being arable or in grass, and a twentieth in wood. The coast-line is 85 m. long. Some cliffs at the Naze are 35 ft. high. The center and n. of the county are beautifully diversified and richly wooded, the highest point being Langdon hill, 620 ft. above the sea. Besides the Thames, the other chief rivers are the Stour, 50 m. long; Blackwater, 46 m.; Lea, Roding, Crouch, and Chelmer. The e. of the county is mostly on London clay, with limestone beds near Harwich. In the n.w., chalk appears. In the middle and n., there is much diluvium, with chalk fragments. Crag occurs near Harwich, and stones of phosphate of lime are found here and there. E. has few manufactures, except in the neighborhood of London, where are chemical works, tar, and other works of a kind that could not be carried on in a large scale within the metropolitan boundaries. The Thames iron-work and ship-building company, near the new Victoria docks, are another manufacturing feature of the county. At Colchester, there is a great silk-mill, as there are also at Bocking, Braintree, and Halstead. Tambor lace is made at Coggeshall and a few other places; there is straw-plaiting in some of the smaller towns, but the county has, notwithstanding, comparatively few distinctive manufactures. The chief crops are wheat, barley, oats, beans, potatoes, saffron, caraway, and hops. Great numbers of calves are fattened for the London market, and there are large sheep-flocks. E. has valuable oyster-fisheries. Pop. in 1861, 404,644; in 1871, 466,436. The county is almost entirely in the diocese of Rochester. E. returns six members to parliament. E. was once forest-land, and the seat of a powerful tribe, the

Trinobantes, whose famous chiefs, Caractacus and Boadicea, were overthrown by the Romans. E. constituted part of the Roman *Flavia Cæsariensis*. It has afforded many Roman remains, and a Roman road once passed through Colchester, which was an important Roman station. The Saxon kingdom of Essex included London and parts of Middlesex, Hertford, Bedford, and Essex.

ESSEX, a co. in the province of Ontario, Canada, between lakes Erie and St. Clair; traversed by the Great Western and the Canada Southern railroads; 235 sq.m.; pop. '71, 32,697. Co. seat, Sandwich.

ESSEX, ROBERT DEVEREUX, EARL OF, son of Walter Devereux, first earl of E., was born at Netherwood in Herefordshire, 10th Nov. 1567; entered Trinity College, Cambridge, at the age of 10, where he remained for four years. Lord Burleigh, to whose guardianship he had been intrusted, introduced the handsome and gifted youth at court in 1584. Here, by his agreeable manners, his appearance, and talents, he established himself among troops of friends, and gained the special favor of Elizabeth. In 1585, he accompanied the earl of Leicester to Holland, where he distinguished himself at the battle of Zutphen, and on his return to England was made master of the horse and knight of the garter. After the death of Leicester, E. continued to rise in the favor of Elizabeth, who loaded him with honors. In 1591, he commanded the forces sent to the assistance of Henry IV. of France against the Spaniards, but achieved no success. The next few years were spent in endeavoring to get the better of Burleigh—the wisest, the most prudent, and the most politic of all Elizabeth's advisers. In 1596, he was appointed joint-commander with lord Howard in the expedition against Spain, to which Burleigh was strongly opposed; and though E. displayed all his wonted courage, and contributed to the capture of Cadiz, which caused immense loss to the Spaniards, yet the expedition resulted in nothing, and E. had to defend himself against various accusations on his return. In 1597, he was made earl marshal of England, and, on the death of lord Burleigh, chancellor of Cambridge. In 1598 occurred the first fatal mistake in E.'s career. Presuming upon Elizabeth's admiration and feminine fondness for his person, he differed from her about some trifling matter, and angrily and rudely turned his back upon her in the presence of some of the council, and her majesty, whose language was hardly more delicate than her father's, gave him a vigorous box on the ears, telling him to "go and be hanged." A violent quarrel ensued, which, though apparently smoothed up, was never really so. E. was afterwards, in 1599, sent to Ireland—part of which at that time was in a state of rebellion—as lord-lieutenant of that country; but here his government was ill-advised and ineffectual, and after a few unimportant undertakings, he concluded a truce with the rebels, which was regarded at court as high treason. In order to confront his enemies, he hastened back to London, contrary to the queen's express commands, and forced his way into Elizabeth's bedchamber. Justly offended, the queen deprived him of his dignities, and commanded that he should be called to account for his behavior. E., advancing from one degree of foolhardihood to another, tried to excite an insurrection in London. He was imprisoned, tried, and found guilty. Elizabeth long delayed signing the warrant for his execution, in the hope that he would implore her pardon. He was beheaded on the 25th Feb., 1601, after defending himself with pride and dignity. E. was rash, bold, and presumptuous; but brave, generous, and affectionate, and the friend and patron of literary men.

ESSEX, ROBERT DEVEREUX, Earl of, 1591–1646. He was a companion of the prince of Wales. At the age of 15 he was married to Frances Howard, daughter of the earl of Suffolk, but nine years afterwards the marriage was annulled on account of the wife's intimacy with Rochester, earl of Somerset. A second marriage also ended unhappily. In 1620–23, he served in the wars of the palatinate, and in 1625 was vice-admiral of a fleet which made an unsuccessful effort to capture Cadiz. In 1639, he was lieut. gen. of the army sent against the Scotch covenanters; but no fighting was done. His summary dismissal made him an enemy of the king (Charles I.), and in 1642, he was commander of the parliamentary army. He won the battle of Edgehill, captured Reading, and relieved Gloucester; but in 1644, because of his unwillingness to fight the king in person, he lost nearly the whole of his army. In 1645, he resigned his commission, but was granted an annuity of £10,000 for his past services.

ESSEX, THOMAS CROMWELL, Earl of. See CROMWELL, THOMAS, *ante*.

ES-SIOUT. See SIOUT.

ESSLINGEN, a manufacturing t. of Germany, in the kingdom of Würtemberg, is situated near the right bank of the Neckar, in the center of a pleasing and fertile district, 7 m. e.s.e. of Stuttgart. It consists of the town proper, and five suburbs, and is surrounded by strong walls, and fortified by towers. The chief buildings are the *frauenkirche*—a splendid edifice in the purest Gothic style, built in 1440, and surmounted by a spire 230 ft. high—the old and new town-houses, and the old castle. It has the greatest machine-making trade of the kingdom, has manufactures of a wine called Esslingen champagne, of woolens, and cotton and woolen yarns, lackered iron, silver-plate and tin wares, and paper, with a good trade in wine and agricultural produce. Pop. '75, 19,602.

E. was founded in the 8th c., and received, in 1209, the rights of a free city of the

German empire. The long and bloody quarrel which existed between it and the house of Würtemberg was brought to an end at the peace of Lunéville (1802), when E., with its territory, was assigned to the duchy of Würtemberg.

ESSOUAN, or ESWAN. See ASSOUAN.

ESTABLISHED CHURCH, a church established and maintained by a state for the teaching of Christianity in a particular form within its boundaries. Subsequent to the reformation, many of the opinions which had given sanctity to the church of Rome still kept possession of men's minds; amongst these was the notion, that the civil government of each state was bound to maintain a particular form of Christianity. The same fallacious reasoning which in more recent times has led to the search for one absolutely best form of civil government was at work then with reference to the church. The Roman Catholic church was not the best form—of that the Protestant states had become convinced—but all forms were not therefore indifferent; and if one was better than another, and another better than that, there must be an absolutely best, which the state was bound to discover, and when discovered, to substitute for that which had been abolished. The idea that the good or bad qualities of forms of government, whether civil or ecclesiastical, so long as they did not violate the fundamental doctrines of Christianity or morality, were relative, and not absolute, and that whilst one might be the best for men in one stage of development or of one particular temperament, another might be the best for those who differed from them in these respects, did not belong to that age. Each Protestant state consequently established a church, conformity to the tenets of which it enforced, not only upon those who as ministers were henceforth to enjoy the property which in Roman Catholic times had been devoted to the spiritual interests of the community, but very often on its own civil servants and advisers. The benefit of the arrangement was, that, to a greater or less extent, the means which the community had set apart for its own spiritual improvement were protected from the spoliation of private individuals; and this benefit was secured more effectually the more completely the new church took the place of the old—in England, for example, better than in Scotland; but as each of the Protestant states had substituted one form of church-government for another, and as the same form had not been adopted by them all, the idea of there being one form which was absolutely preferable to the others, though not abolished, was rudely shaken. In England, queen Elizabeth had stated in her celebrated declaration, that she, as head of the church, "would not endure any varying or departing in the least degree" from the doctrines of the Episcopal church of England as set forth in the thirty-nine articles; and yet Presbyterianism was established in England in 1649. In Scotland, where Presbyterianism had at first taken root, Episcopalianism had more than once become the law of the land. The effect of such occurrences was to counteract the belief in any one form as the form for all Christendom, and to facilitate dissent and the formation of sects. The pastors of these sects were not at first recognized by the law as entitled to any of the privileges of Christian ministers. Whatever they might be to their own flock, to the state they were laymen, and their churches were mere secular lecture-rooms, or, at most, places of meeting for private devotion. See NONCONFORMISTS, DISSENTERS, CHURCH, etc. Gradually this view become modified, and the civil consequences attaching to sacred rites, when performed by a clergyman of the establishment, were extended to them when performed by dissenters. See MARRIAGE. But though many of the privileges, and all the liberties belonging to the established church, have now been extended to dissenting bodies, including Roman Catholics (see ROMAN CATHOLIC EMANCIPATION) and Jews (see JEW), the established churches of England and Scotland are supported by the state, and guarded from spoliation by the coronation oath (q.v.). The grant to the Roman Catholic college of Maynooth, and the *Regium Donum* (q.v.) to the Presbyterian ministers in Ireland, were capitalized by the act (1869) which disestablished the Irish church. There is no endowment to other religious denominations as in France; and the emoluments of the established church in England, though modified in their distribution by the labors of the ecclesiastical commissioners (q.v.), have not yet been appropriated to any other than religious uses in connection with that church.

The cause of established churches is very generally maintained on the ground of the alleged duty of the state to provide for the religious instruction of the whole body of the people, as most essential to their moral welfare, and so to the general prosperity of the community. It is further argued, in support of the same cause, that civil rulers, or the people as associated in a free state, are under a moral obligation of the highest kind, to acknowledge God, his law, and his ordinances. Concerning which, and other arguments, for and against established churches, as far as it belongs to the scheme of this work to notice them, the reader is referred to the article VOLUNTARYISM. It may here, however, be observed, that the arguments just mentioned do not necessarily infer, even when admitted to the utmost that the state is bound to support in any exclusive way a particular sect or denomination, unless on the further assumption that religious truth and worth belong to that denomination alone. Nor does the *endowment* of a church by the state necessarily follow from the fullest adoption of the principles thus contended for. And, on the other hand, it is a point which may very reasonably be disputed, how far the common arguments against state endowments are applicable to those endowments which were not originally bestowed by the state, but which the state has, from a

very early period, recognized as belonging to the church; a description which will be found to comprehend great part of the existing endowments of established churches. The exclusive possession of them by a particular denomination, and their rightful appropriation to religious uses, are, however, distinct questions.

ESTAFETTE, in Europe, an express for the conveyance of letters and small packages. The articles are consigned to the care of the postilions on duty along the route.

ESTAING, CHARLES HECTOR, Comte d', 1729–94; a French admiral, b. Auvergne. He first entered the army, and in 1757, as brig.gen., accompanied count de Lally to the East Indies. At the siege of Madras, 1759, he was made prisoner, but was released on parole. He at once resumed service in command of two ships of war, and being again taken captive in 1760, he was thrown into prison at Portsmouth for breaking his parole. He was soon released, and was appointed lieut.gen. in the navy in 1763, and in 1777 vice-admiral; and in 1778, commanded the fleet sent to aid the United States against Great Britain, bringing with him Gérard, the first French ambassador to the United States. He planned, with the American generals, a combined land and naval attack on Newport; and his demonstrations forced the British to burn or sink six frigates lying in the harbor; but lord Howe came, with an English fleet, to relieve Newport, and d'Estaing put to sea to engage him. A sudden storm separated the fleets, and d'Estaing put into Boston to repair his shattered ships. In Nov. he sailed to the West Indies, where he captured St. Vincent and Grenada, compelling the fleet which had come to relieve Grenada to retire to the harbor of St. Christopher. With 22 ships he co-operated, Oct. 9, 1779, in the unsuccessful attack on Savannah, and was himself wounded. The following year he returned to France. He commanded the combined fleet before Cadiz, when the treaty of peace was signed in 1783. Entering into French politics, he was elected to the assembly of notables in 1787, in 1789 he commanded the national guard, and in 1792 the national assembly chose him admiral. In 1793, he bore testimony in favor of Marie Antoinette. The following year he was himself brought to trial, condemned, and executed.

ESTATE. In the law of England, an estate in lands, tenements, or hereditaments, signifies such interest as the tenant hath therein; so that if a man grants all his estate in Dale to A. and his heirs, everything that he can possibly grant shall pass thereby.—Blackstone, *Comm.* ii. 103. The first division of estates is into legal and equitable. By the former is signified the estate which a man has by the common law; by the latter, the interest which has been created by the operation of a court of equity. See EQUITABLE ESTATES, USES, TRUST. Legal estates are considered in England with reference to the quantity of the estate, the time of enjoyment, and the number of persons who may unite in the enjoyment. Under the first head, estates are either freehold or less than freehold. Freehold estates, again, are divided into freeholds of inheritance, or fees; and freeholds not of inheritance, or for life. An estate for life may be for the life of the person to whom it is granted, or for that of another person, or for more than one life. A person holding an estate for the life of another is called tenant *pur autre vie*. An estate *pur autre vie* being a freehold, descends, in case of the death of the tenant during the term, to his heir, and not to his executor. An estate by the courtesy of England (q.v.), and an estate in dower (q.v.), are estates for life. A conveyance to A. B., without mention of heirs, makes the grantee tenant for life. An estate to a woman during her widowhood, or to a man until the occurrence of a specified event, as till he receive a benefice, will be construed to be an estate for life. Tenants for life are entitled to take estovers (q.v.), but they must not commit waste (q.v.). The representatives of a tenant for life are also usually entited to take the emblements (q.v.) on the expiry of the term. Estates less than freehold are called also chattels real. This species of estate, on the death of the tenant, passes, like other chattels (q.v.) to the executor, and not to the heir. They are divided into estates for years, estates at will, and estates on sufferance. See LEASES. Estates, with reference to the time of their enjoyment, may be either in possession or in expectancy. An estate in possession comprehends not only an estate in the actual occupation of the tenant, but one from which he has been wrongfully ousted. In this latter case, the law regards the rightful tenant as having the actual estate, to which is attached the right of entry (q.v.). An estate in expectancy may be either in reversion or remainder (q.v.). Estates of this character form a large portion of the rights to land in England, and are the subject of some of the most subtle learning of the English law. With reference to the number of persons entitled to the enjoyment, estates may be in severalty, in joint-tenancy, in coparcenary, or in common. An estate in severalty is where the sole right to the estate is in a single person. See JOINT-TENANCY, COPARCENARY, TENANCY IN COMMON.

ESTATE (*ante*), in law a term signifying in its broadest sense an interest in any kind of property, but more especially in lands. By the common law there are two general divisions of estates in lands, according to the amount of interest in the same in different cases. There are, first, freehold estates; secondly, estates less than freehold. A freehold estate is for life or longer. An E., the possession of which is limited to a certain number of years, or circumscribed by other conditions, is less than a freehold, ranking as personal property. Freehold estates are estates of inheritance, or estates not of inheritance, the latter being for life only. A freehold E. may be held either in fee

simple or in fee tail, the first expressing the highest interest which a man can have in land, the latter implying limitations of some sort. Estates less than freehold are either held for a time specified at will, or by sufferance. An E. at will is terminated by either party by such notice as has been mutually agreed upon. An E. is held by sufferance when the occupant holds over after expiration of time. Estates are divided again into legal and equitable; again into estates in possession and estates in expectancy; and still again into estates in severalty, in joint tenancy, in common, and in coparcenary. An E. in severalty is one which has but a single owner; an E. in joint tenancy is one owned jointly by two or more individuals; an E. in common is one where separate but individual interests are held by different persons; an E. in coparcenary is one held by females in the land of an intestate ancestor.

ESTATES OF THE **REALM.** The three estates of the realm are not king, lords, and commons, as is popularly believed, but the lords spiritual, the lords temporal, and the commons. The ancient parliament of Scotland consisted of the king and the three estates of the realm, by which latter was meant—1st, the archbishops, bishops, abbots, and mitered priors; 2d, the barons, under which head were comprehended not only the nobility, but the commissioners of shires and stewartries; and 3d, the commissioners from the royal burghs. All these assembled in one house, and formed one meeting, by a majority of the votes of which all matters, whether legislative or judicial, were determined. Ersk. b. i. tit. 3, s. 2. Bell's *Dictionary*. See STATES.

ESTATE TAIL. See ENTAIL.

ES'TÉ (ancient *Ateste*), a t. in the Italian province of Padua, situated on the southern slope of the Euganean hills, 17 m. s.s.w of Padua. It is an old town, and has a decidedly Lombard appearance, many of the houses being supported by arches. It has several interesting buildings, among which the chief are the *Rocca*, or castle of E., with a grim-looking donjon tower, overhanging the town, and the church of *San Martino*, in the Romanesque style, surmounted by a campanile, which slopes as much as the leaning tower of Pisa. Both church and tower have been sadly disfigured by an attempt to modernize them. E. manufactures silk goods, saltpeter, hats, and earthernware, and has numerous silk-mills and whetstone quarries in the vicinity. Pop. about 6,000.

ES'TĒ, one of the oldest and most illustrious families of Italy, which, according to the historian Muratori, owed its origin to those petty princes who governed Tuscany in the times of the Carlovingians, and who were in all probability of the race of the Longobards. The first whose figure is more than a mere shadow is Adalbert, who died about 917 A.D. The grandson or grand-nephew of Adalbert, named Oberto, was one of the Italian nobles who offered the crown of Italy to Otho of Saxony. He is afterwards styled *Comes sacri palatii*, and appears to have been one of the greatest personages in the realm; he married a daughter of Otho's, and died about 972 A.D. In later times, the family of E. received from the emperors several districts and counties, to be held as fiefs of the empire. The family divided, at an early period, into two branches, the German and Italian. The former was founded by Welf or Guelfo IV., who received the investiture of the duchy of Bavaria from the emperor Henry IV. in 1070. The houses of Brunswick and Hanover, and consequently the sovereigns of Great Britain, also called Este-Guelfs, are descended from this person. In the 12th, 13th, and 14th centuries, the history of the E. family, as heads of the Guelf party, is interwoven with the destinies of the other ruling families and small republics of northern Italy. During this period, they first gained possession of Ferrara and the march of Ancona (1208 A.D.), and afterwards of Modena and Reggio (1288–89), and were widely celebrated as the patrons of art and literature. One of the most illustrious was Azzo VII., who encouraged Provençal troubadours to settle at his court at Ferrara, and also founded schools in that city. Alfonso I. (d. 1534) was equally distinguished as a soldier and a statesman, and was celebrated by all the poets of his time, particularly by Ariosto. His second wife was the notorious Lucrezia Borgia. His quarrel with the popes Julius II., Leo X., and Clement VII., was unfortunate, as an interdict was laid upon him for his adherence to the league of Cambray, and his papal fiefs declared to be forfeited. After the siege of Rome, in 1527, the duke was restored to his former possessions by Charles V. His successor, Ercole or Hercules II., who married Renate, daughter of Louis XII of France and Anne of Brittany, attached himself to Charles V. He and his brother, a dignitary of the Catholic church, were also liberal patrons of arts and sciences; the latter erected the magnificent villa d'Este at Tivoli. The next prince, Alfonso II. (d. 1597), would have been noways inferior to the preceding but for his immoderate love of splendor, his inordinate ambition, and the cruelty he displayed toward the poet Tasso, whose eccentricities, however, it must be confessed, were enough to try the patience of any reasonable mortal. Alfonso IV., who flourished in the latter half of the 17th c., was very fond of the fine arts, and founded the Este gallery of paintings. *Rinaldo* (d. 1737), by his marriage with the daughter of the duke of Brunswick-Lunenburg, united the German and Italian houses, separated since 1070. The male line of the house of E. became extinct on the death of Ercole III. in 1803, his possessions having been previously seized by the French invaders, and annexed to the Cisalpine republic. His only daughter married the archduke Ferdinand, third son of Francis, emperor of Austria. Their eldest son, Francis IV., by the treaty of 1814–15, was restored to the territories

which had belonged to his maternal ancestors, comprising the duchy of Modena; and, on his mother's death, obtained the duchies of Massa and Carrara. He was succeeded by his son, Francis V., 21st Jan., 1846. The connection which the family of E., like others of the small Italian principalities, had formed with Austria, gave it, of course, pro-Austrian sympathies, the result of which has been fatal to its popularity and dynastic existence. In 1860, the sentiment of Italian unity and independence, which for the previous 15 or 20 years had been steadily fostered by the policy of Sardinia, triumphed in a universal explosion of national feeling, which united the peninsula (with the exception of Rome and Venice) under the authority of Victor Emmanuel. Venice was added to the kingdom of Italy in 1866, and Rome became the capital in 1870.

ESTEL'LA, an ancient city of Spain, in the province of Navarre, is pleasantly situated on the left bank of the Ega, about 27 m. s.w. of Pamplona. It is a well-built, clean town, with several squares, and has, in the environs, a variety of agreeable promenades and pleasure grounds. It has two interesting churches, both old, and one of them, San Juan, a fine building with a very lofty tower. The manufactures are woolen and linen fabrics, brandy, and earthenware. A tolerable wine is made in the vicinity. E. has some trade in fruits, wool, hardware, and grain. Pop. about 6,000. Here Don Carlos was proclaimed king in Nov., 1833; and at E., again become a Carlist stronghold, battles were fought in 1874 and 1875. The city was taken by the government troops in Feb., 1876.

ESTE'PA, a t. of Spain, in the province of Seville, and 60 m. e.s.e. of the town of that name. It is, on the whole, well built; has several squares, and numerous religious edifices, among which are the churches of Santa Maria and San Sebastian; the former, a noble specimen of Gothic, having three naves, and a richly ornamented interior. It has manufactures of coarse cloth, baize, and oil, with a trade in grain, fruits, oil, brandy, wool, and cattle. In the vicinity are marble and building-stone quarries. Pop. 7,389.

ESTEPO'NA, a maritime t. of Spain, in the province of Malaga, and 25 m. n.n.e. of Gibraltar. It is well and regularly built; its streets wide, clean, and well paved. It supplies Gibraltar with fruits and vegetables; and its chief industrial features are its fishing, linen-weaving, and manufactures of leather. Pop. 9,400.

ESTERHAZY, an ancient Hungarian family, afterwards raised to the rank of princes of the empire, the representative of which is at present the richest landed proprietor in Austria. The family divided into three main branches—the Esesznek, Altsohl or Zolyom, and Forchtenstein lines. A descendant of the last family, Nicholas de E., born in 1765, traveled over a great part of Europe, and resided for a considerable time in England, France, and Italy. He founded the splendid collection of pictures at Vienna. He also made a choice collection of drawings and engravings. When Napoleon, in 1809, entertained the notion of weakening Austria by the separation of Hungary, he made overtures to prince E. respecting the crown of Hungary, which, however, were declined. The great Haydn composed most of his works at the court of prince Nicholas. His son, prince Paul Anton d'E., born in 1786, entered at an early age on a diplomatic career. After the peace of Vienna, he went as ambassador to the court of Westphalia. From 1815 to 1818, he represented the Austrian government at London. He filled the same office between 1830 and 1838, and distinguished himself by his diplomatic tact and ability. In 1842, he returned home, and continued to exert himself in the cause of political and literary progress. In Mar., 1848, he became minister of foreign affairs, in the cabinet presided over by Batthyani; but when the struggle between Austria and Hungary broke out, he exhibited more prudence than heroism by retiring from public affairs altogether. He died in 1366. The hereditary prince, Nicholas Paul Charles E., born 25th June, 1817, married lady Sarah Villiers, daughter of the earl of Jersey.

ESTHER (the word signifies "the planet Venus") is the Persian name of Hadassah, daughter of Abihail, the son of Shimei, the son of Kish, a Benjamite. She is represented in Scripture as an orphan, and as having been brought up by her cousin Mordecai, an officer in the household of the Persian monarch Ahasuerus. Her history, as recorded in the book of E., is well-known and extremely interesting. When the misconduct of Vashti had cost her her "royal estate," all "the fair young virgins" of the kingdom were gathered together, that Ahasuerus might choose a successor. He selected Hadassah, who received the name of E. on account of her loveliness. The great event of her life was the saving of her Jewish countrymen from the horrors of that universal massacre planned by the malice of Haman, and consented to by the thoughtless cruelty of an oriental despot. The details of this event are too familiar to require narration. It is sufficient to say that E.'s success was signal; and the feast which she and her cousin Mordecai appointed in memory of their deliverance—viz., the feast of Purim (i.e., of Lots), is, in consequence, celebrated with great enthusiasm. E. is not mentioned in profane history, whence it has been inferred by some that she was not exactly the *wife* of Ahasuerus (Xerxes), but rather the favorite of his harem, to which she undoubtedly belonged; for, as we read (ii. 8), E. was consigned "to the custody of Hegai, keeper of the women." This hypothesis is rendered probable by the fact, that the Persian kings did not choose wives from their harem, but from the principal Persian families, or else from the daughters of foreign potentates.

ESTHER, BOOK OF, one of the very latest of the canonical works of the Old Testament, and commonly, but without a shadow of evidence, supposed to be written by Mordecai or Ezra. This is the view of Abenesra, Clement of Alexandria, Augustine, Gerhard, and others. The Talmud assigns the authorship to the members of the great synagogue, a semi-mythical body, who are made use of by Jewish rabbis and Christian divines as a sort of *Deus ex machina* to solve every difficulty. According to the opinions of the most learned and unprejudiced critics, the date of its composition must be placed after the downfall of the Persian monarchy. The language is much later than that of Ezra and Nehemiah, and the fact of occasional explanation of Persian customs fits the period of the Seleucidæ better than an earlier one. The Hebrew text is that which has been followed in the English version; but the Septuagint is full of late interpolations and additions by Alexandrian Jews. The book is held in the highest reverence by the Jews; so much so, that Maimonides declared that, in the days of the Messiah, every Jewish scripture would be forgotten except the book of Esther and the Pentateuch. The book is not written in a theocratic spirit, like the rest of Jewish literature. Nothing is directly attributed to God; in fact, his name is not once mentioned. Neither is there the remotest trace of religious feeling of any kind. Luther, in his usual off-hand hasty way, expressed his contempt for the book, in spite of the admiration which the Jews bestowed on it, censuring it for its "heathenish extravagance," and declaring that, in his judgment, it was "more worthy than all of being excluded from the canon." The absence of all recognition of God, perplexed some of the ancient Jewish commentators, who therefore invented the hypothesis, that the book was originally a part of the Persian chronicles, probably executed by Mordecai; and that, being intended for the heathen, the sacred name was wisely left out!

ESTHER, BOOK OF, records events in Jewish history belonging to the interval of nearly 60 years that elapsed between the sixth and seventh chapters of Ezra. It has always been accepted by the Jews as canonical, and by many of them is esteemed worthy to be classed with the Pentateuch itself. Among Christians some have questioned its canonical authority, because it does not mention even the name of God, and because, as they say, it breathes a spirit of national pride and of revenge. To these objections it has been replied that, although the name of God does not appear, his providence is, in fact, exhibited, and the advantage of prayer and faith is shown; and that the traits of character ascribed to both Persians and Jews of that day are in strict accordance with history. While the book may be reasonably defended on these grounds, the defense appears much more triumphant on the hypothesis, which many advance, that the whole narrative is a transcript from the records of the Persian court which Esther or Mordecai obtained from the king. When it is read with this idea in mind, new light is poured on it. Everything in it is seen to be stated according to the Persian view, and the book bears the same relation to the Bible as the decrees of Nebuchadnezzar, Cyrus, and Darius recorded in the books of Daniel and Ezra. According to this view the book itself is not to be regarded as inspired, and no part of it need be defended as if it were. It exhibits Persian luxury, despotism, and caprice, as well as traits of Jewish character that are not to be praised. If any ask, "What, then, is inspired about the book?" the answer is that the direction to place it in the canon of Scripture was inspired; just as the direction to record Satan's words to Eve and to Christ was inspired, although the words themselves were blasphemous and false. That this historical narrative should have a place in Scripture was important on many accounts, one of which alone (capable of being rightly estimated only by the Divine mind) was sufficient to require it, viz., that the interposition of God's providence to save the Jews when they were in imminent peril of being exterminated might be shown to the world. That, without this interposition, the line of human descent from which the Messiah was to spring would, in all probability, have been cut off, *links the book of Esther into the unity of the Scriptures by which they all refer to Christ.* And as the Passover, observed by the Jews throughout their generations, is the memorial of their exodus from Egypt, so the feast of Purim, likewise observed by them to this day, commemorates their deliverance through Esther the queen.

Apocryphal Additions to the Book.—In the Septuagint version of E. there are six important passages, having no Hebrew original, inserted at different points of the narrative, and forming with the rest a well digested whole. They were probably designed to meet the objection that the book did not contain the name of God, and to make his agency in the deliverance of his people more prominent and clear. In the 4th c. after Christ, when Jerome translated the book into Latin, he gave first the parts contained in the Hebrew, and placed the six others by themselves, adding marks and explanations by which their design and connection might be known. But in subsequent editions of the Vulgate these explanations were removed and the additions printed as supplemental chapters of the original book. This plan, which greatly impairs their significance and force, has been followed in the English version of the apocryphal parts, where they are called "*The rest of the chapters of the book of Hester which are found neither in the Hebrew nor in the Chaldee.*"

ESTHO'NIA, called by the inhabitants themselves *Wiroma* (i.e., the border-land), a Russian government, and one of the Baltic provinces (q.v.), extends immediately s. of the gulf of Finland; has an area of 7,787 sq.m., and a pop. (1870) of 323,961. It was

conquered (1182–1241) by the Danes, who sold it to the Teutonic knights in 1346. It came into the possession of the Swedes in 1561, but was taken from them by Peter the great in 1710; and by the treaty of Nystadt was finally secured to Russia in 1721. One third of the entire surface, which is in general flat, is under cultivation, and produces great quantities of rye and barley; the remaining two thirds are chiefly composed of sandy tracts and marshes, strewn in many places with large blocks of granite; there are also extensive forests of birch and pine. The government of E. is divided into four circles; its principal town is Reval or Revel (q.v.).

The inhabitants are divided into Esthlanders and Esths. The former are a mixture of Swedes, Germans, and Russians, and comprise the nobles and the town-populations. The latter belong to the Finnish race, and are the original possessors of the soil. Their language is soft and musical, and is divided into two leading dialects, that of Revel and that of Dorpat. They also possess a literature rich in splendid national songs. See Neus, *Esthnische Volkslieder* (Reval, 1850–51). They are industrious, kind-hearted, and in the main religious and attached to the Protestant doctrines. A great part of Livonia is peopled with Esths, the entire number of whom in the Baltic provinces is about 650,000.

ESTIENNE, or ETIENNE. See STEPHENS.

ESTILL, a co. in central Kentucky divided into nearly equal parts by Kentucky river; 320 sq.m.; pop. '70, 9,198—599 colored. It has abundant water-power, and mines of iron and coal, with hilly but fertile soil. Co. seat, Irvine.

ESTOC (Italian), a small dagger worn at the girdle, called in Elizabethan times a tucke.

ESTOILE, or STAR, in heraldry, differs from the mullet (q.v.) by having six waved points; the mullet consisting of five plain points.

ESTOPPEL, an impediment or bar to a right of action, arising from a man's own act. It is called an E. or conclusion, because a man's own act or acceptance stoppeth or closeth up his mouth to allege or plead the truth.—*Co. Litt.* 352 a. Estoppels are of three kinds—1. By matter of record, where any judgment has been given in a court of record, the parties to the suit are estopped from afterwards alleging such matters as would be contradictory to the record. 2. By matter in writing. Thus, a party who has executed a deed will be precluded from afterwards denying, in any action brought upon that instrument, the fact of which it is evidence. 3. By matter in *pays*, as by livery, by entry, by acceptance of rent, etc.—by any of which acts a man is barred from pleading anything to the contrary. The principle of estoppel is that what a man has once solemnly alleged is to be presumed to be true, and therefore he should not be suffered to contradict. The doctrine of estoppel prevails in America as well as in England. In Scotland also, the same principle is recognized, under the name of personal exception (q.v.).

ESTO'VER (Fr. *estoffer*, to furnish), an incident to the estate of a tenant for life or for years. It is the right which the tenant has to make use of the wood on the estate for certain definite purposes. Estovers, or *botes* (Saxon), are of three kinds—housebote, which is twofold—viz., *estoverium adificandi et ardendi*, a right to wood for fuel and repairs of the house, ploughbote, *estiverium arandi*, wood for plows and carts; and haybote, *estiverium claudendi*, wood for repairing hedges and fences.—*Co. Litt.* 41 b.

ESTRAYS', or STRAYS, domestic animals found wandering about without apparent home or known owners. In England the owner has a year and a day in which to claim such cattle, and the proprietor of the inclosure where they are found must make proclamation in a church and in market-towns. When these conditions are fulfilled they belong to the proprietor of the inclosure. The law of estrays varies in the different states of the American union. In some, after an estray has been advertised and kept for a certain time it is sold to pay the charges of advertising and keeping, any balance going to the town treasury. Cattle at large contrary to regulations, or breaking into growing crops and doing damage, can in most states be sent to a pound, and after a short time sold to pay damages and expenses.

ESTREAT' (Lat. *extractum*), in English law, a true extract copy or note of some original writing or record, and specially of fines or amercements, as entered in the rolls of a court, to be levied by bailiffs or other officers. When, however, it is applied to a recognizance (q.v.), it signifies that the recognizance itself is estreated, or taken out from among the other records, and sent to the exchequer.—Blackstone, *Comm.* iv. 253. If the condition of a recognizance be broken, the recognizance is forfeited; and on its being estreated, the parties become debtors to the crown for the sums in which they are bound.—Archbold, *Crim. Practice*, 78. The court of exchequer has power over penalties and forfeitures incurred at assizes, and can discharge or compound them at its discretion; but that court has no power over recognizances forfeited before justices of the peace.

ESTREES, GABRIELLE D', 1571–99; a beautiful French girl who, at the age of 16, became a favorite of Henry III. and about the same time of cardinal De Guise and the dukes of Bellegarde and Longueville. In 1590 she met Henry IV soon after his great

victory at Ivry. He became desperately enamored, but she did not immediately discard her old lover, the duke of Bellegarde. Henry gave her a husband in one M. de Liancourt, but soon afterwards divorced them and raised her to the rank of marchioness, and in 1595 to duchess of Beaufort. Henry lavished riches upon her, and when she died she was the owner of a dozen estates near Paris. The king desired to divorce his lawful wife and marry her, but Sully had sufficient influence to delay the matter until the death of Gabrielle. This event happened suddenly, and not a few persons suspected foul play. She had borne the king three children.

ESTRÉMADURA, next to Alemtejo, the largest province of Portugal, has an area of 6,907 sq.m., and, including the capital, Lisbon, contained in 1874, 903,465 inhabitants. The greater part of the country is hilly, but the hills do not attain any great elevation. To the w. of the estuary of the Tagus are the granite mountains of the Serra da Cintra, varying from 1500 to 1800 ft in height, and terminating in the Cabo de Roca. To the s. of the Tagus are barren moors, partly broken by morasses, and the limestone chain of Arrabida, rising to a height of 1000 ft. and terminating in the Cabo de Espichel. Many districts are extremely fertile, others are barren and uncultivated. The Tagus, which is only navigable as far as Abrantes, receives the waters of the Zezeres, the Sorraya, and the Canha, and is strewn with islands at its mouth. The chief productions of the country are wine, oil, fruits, corn, and cork; but even the sandy plains are covered with cistus, rosemary, myrtles, and other flowering and fragrant plants. The breeding of cattle is not much attended to. The minerals are marble, coal, and sea-salt. This province has been frequently visited by earthquakes.

ESTRÉMADU'RA, previous to the new distribution of the country, a province of Spain, situated between Portugal and New Castile, and watered by the Tagus and the Guadiana. It is bounded on the n. by Leon, on the s. by Andalusia, and, since 1833, has been divided into the two provinces of Badajos and Caceres. It has an area of 16,554 sq.m., and contained, in 1870, 734,377 inhabitants. Although a continuation of the high table-land of New Castile, E. is not, like it, a uniform plain, but is mountainous on the n. and s., and is well watered, the slopes of the hills being covered with wood, and the valleys with rich grass. Notwithstanding the fertility of the soil, the land has lain desolate and uncultivated since the expulsion of the Moors in the 13th century. This is chiefly to be attributed to the Mesta, or right of pasture, which causes the land to be regarded as the common property of the possessors of flocks. The breeding of goats, swine, horses, asses, and mules is much attended to. Silk and honey form no inconsiderable branches of trade. Corn is still imported. The mines, which were formerly very productive, are no longer wrought. Commerce is confined almost entirely to a contraband trade with Portugal. The inhabitants are poor, and, from the want of roads, isolated from the rest of Spain, and consequently in a low state of civilization. They make excellent soldiers, however, and have produced a series of brave *conquistadores* and generals.

ESTREMOZ', a fortified town of Portugal in the province of Alemtejo, is 23 m. n.e. of Evora, and about the same distance e. of Elvas. It is built round the base of the hill on which its once formidable castle, erected in 1360, is placed. It now ranks as the fourth or fifth stronghold in Portugal. E. is famous for its manufactures of earthenware; its jars, which are made of a porous clay, and have the property of keeping water singularly cool, are of elegant shape, and are used all over the peninsula. The earthenware manufactures of E. seem to have continued unchanged since Roman times, as until the present day the forms into which the jars are cast are purely classical. In the neighborhood of E. is a marble quarry. Pop. 6,500.

ESZEK, a royal free town of Slavonia, on the right bank of the Drave, 12 m. above its confluence with the Danube, is the administrative capital of the "Kingdom," and the most prosperous trading-town of Slavonia. Since the Drave began to be navigated downwards to E. by steamers, the town has driven a prosperous trade in corn, wool, pigs, iron, deals, wine, and flax. The fortress of Eszek, known in Roman times under the name of Mursia, is protected by a fort situated on the left bank of the Drave. In the fortress, the commander's dwelling and the town-house, and in the lower town the county buildings, are specially worthy of mention. During the Hungarian revolution, the town was at first held by count Casimir Batthyányi, but capitulated, after a siege of several weeks, to the Austrian general, baron Trebersberg. Pop. '69, 17,247, more than one half of whom are Roman Catholics, the rest being Greek Catholics, Protestants, and Jews.

ESZ'TERHÁZY. See ESTERHÁZY, *ante.*

ESZ'TERHÁZY, NICHOLAS IV., Prince ESZTERHÁZY DE GALANTA, 1765–1833; b. Hungary; a traveler, and a liberal patron of the arts and sciences, the founder of a valuable picture-gallery in his castle in Vienna. His country seat he transformed into a temple of music, and erected there a mausoleum to Haydn. It is said that Napoleon, with a view of weakening Austria, offered the crown of Hungary to Eszterhazy, who firmly refused it.

ESZ'TERHÁZY, NICHOLAS JOSEPH, Prince ESZTERHÁZY DE GALANTA, count of Forchtenstein, 1714–90; grandson of Paul IV., the head of the third branch of the house.

He was distinguished as a soldier in Silesia, but is better known as a patron of art. He served as ambassador at several European courts.

ESZ'TERHÁZY, PAUL IV., Prince ESZTERHÁZY DE GALANTA, head of the third branch of the house of Eszterházy, 1635–1713; he was an Austrian field-marshal, and distinguished in the wars with the Turks. In 1687, he was made a prince of the Holy Roman empire, in reward for his great services in defending Vienna and Ofen from the Turks.

ESZ'TERHÁZY, PAUL ANTHONY, Prince ESZTERHÁZY DE GALANTA, 1786–1866; son of Nicholas IV.; for the greater part of his life a diplomatist. He was ambassador of Austria at Rome twice, once at Dresden, and once at London. In the Hungarian uprising of 1848, he was minister of foreign affairs. After the suppression of the revolution he retired from public life.

ETAH, a district in British India, included in the division of Agra, s. of the Ganges; between 27° 20′ and 28° n., and 78° 30′ and 79° 20′ e.; 1512 sq.m.; pop. '72, 703,527, about seven eighths Hindus. It is chiefly an elevated alluvial plain, with some fertile land. The productions are wheat, barley, cotton, sugar-cane, opium, indigo, etc. There are two harvests in the year. The manufacture of indigo is a leading industry. This region was the seat of a primitive Aryan civilization.

ETAMPES (anc. *Stampæ*), a t. of France, in the department of Seine-et-Oise, is situated 32 m. s.s.w. of Paris, on the Orleans railway. It consists mainly of one street, about 4 m. long. The chief buildings are the ecclesiastical edifices. E. possesses a public granary, capable of containing 1400 tons of wheat. In and around E. there are upwards of 40 flour-mills, constantly employed in providing for the Paris market; considerable quantities of garden-stuff are sent from this neighborhood to the capital. Pop. '76, 7,399.

ÉTAMPES, ANNE DE PISSELEU, Duchesse d', 1508–76; mistress of Francis I. of France, over whom she had very great influence. But she was exceedingly jealous of Diana of Poictiers, the mistress of the dauphin (afterwards Henry II.), and under this passion betrayed state and army secrets to Charles V. After the death of Francis she was banished from court.

ETANG DE BERRE, a salt lake of France, in the s. of the department of Bouches-du-Rhone, communicates with the sea by a narrow channel, called Tour-le-Bouc, and is 11 m. long by 9 broad at its widest part. This lake contains great quantities of eels and other fish. Salt-works are in operation on its banks.

ETAWAH, a t. of the Doab, stands near the left bank of the Jumna, about 70 m. below Agra, in lat. 26° 46′ n., and long. 79° 4′ east. Though it is, on the whole, a dreary and mean place, yet it presents some remains of ancient grandeur, more particularly many of those ghats or flights of stairs which facilitate the approach to the river for the purpose of ritual ablution. It contains (1872) 30,549 inhabitants; and its prosperity, such as it is, is owing chiefly to its position at the junction of the two roads which lead to Agra from Cawnpore and Calpee.

ETA'WAH, or ITAWA, the district of which the above town is capital, belongs to the lieutenant-governorship of the North-west Provinces. It lies entirely in the basin of the Jumna and almost exclusively within the Doab, stretching in n. lat. from 26° 21′ to 27° 9′, and in e. long. from 78° 46′ to 79° 49′, and containing 1691 sq.m., and (1871) 668,641 inhabitants. The district was at one time famous for the murderous fanaticism of the Thugs, 67 corpses of their strangled victims having been found in the wells during a single year.

ETCHING. See ENGRAVING.

ETCHING UPON GLASS. See GLASS.

ETCHEMINS, formerly an Indian tribe in Maine, now represented by the Penobscots and the Passamaquoddies. They dwelt between the Micmacs and the Abenaquis tribes. There are about 1000 still left. Nearly all are Roman Catholics.

ETCHMIADZIN', EDCHMIADZIN, or ITSMIADZIN, a t. and monastery in the Russian government of Erivan, famous as the seat of the catholicus, or primate of the Armenian church. It is situated in the plain of the Aras or Araxes, about 2,985 ft. above the sea, 12 m. w. of Erivan, and 30 m. n. of Mt. Ararat. The monastery comprises an extensive complex of buildings, and is surrounded by brick walls 30 ft. high, which, with their loopholes and towers, present the appearance of a fortress. Its architectural character has been considerably impaired by additions and alterations in the modern Russian style. On the w. side of the quadrangle is the residence of the primate; on the s. the refectory, built by the catholicus Abraham, 1730–35; on the e. the lodgings for the monks; and on the n. the cells. The cathedral is a small but fine cruciform building, with a Byzantine cupola at the intersection, a large tower at the western end, and a smaller tower above each wing of the transepts. Of special interest is the porch, built of red porphyry, and profusely adorned with sculptured designs somewhat similar to those of Gothic architecture. The interior of the church is decorated with Persian frescos of flowers, birds, and scroll-work. It is here that the catholicus confers episcopal consecrations by the sacred hand of St. Gregory; and here every seven years he prepares with great solemnity the holy oil which is to be used throughout the churches

of the Armenian communion. Of the numerous relics, the chief are the head of the spear which pierced the Savior's side; a piece of Noah's ark, presented by an angel to St. James of Nisibis; and a piece of the true cross. Outside of the main entrance are the alabaster tombs of the primates Alexander I. (1714), Alexander II. (1755), Daniel (1806), and Narses (1857); and in hospitable contiguity a white marble monument erected by the East India company to mark the resting-place of sir John Macdonald, who died at Tabriz in 1830, while on an embassy to the Persian court. The library of the monastery is said at one time to have contained 15,000 volumes, and in spite of depredation and neglect, it still remains a rich storehouse of Armenian literature. Among the more remarkable manuscripts are a copy of the Gospels in a massive binding of carved ivory, dating from the 10th or 11th c., and three Bibles of the 13th c., one of which had belonged to Aytoun II., king of Armenia. A type-foundry, a printing-press, and a bookbinding establishment are maintained by the monks, who publish a weekly Armenian newspaper called *The Ararat*, and supply religious and educational works for their co-religionists. The number of inmates in the monastery varies considerably. In 1834, there were 50 monks and 13 bishops and archbishops; and in 1872, there were 5 bishops and archbishops, 20 monks, and 25 novices. The revenue, estimated at $50,000, is derived from the conventual domains, which, though much less extensive than formerly, still comprise not only a number of estates, but five villages, presented or rather restored by the Russian emperor. The catholicus has an annual income of $7,500. To the e. of the monastery is a college and seminary of modern erection. At the distance of about half a mile stand the churches of St. Rhipsime and St. Gaiana, two of the early martyrs of Armenian Christianity; the latter is of special interest as the burial-place of all those primates who are not deemed by the synod worthy of interment beside the cathedral. From a distance the three churches form a striking group, and accordingly the Turkish name for Etchmiadzin is simply "Utch-Kilissi," or the "Three Churches:" a fourth of less importance is ignored. The town of Etchmiadzin, or as it should be called Vagharshapat, contains about 8,000 inhabitants, but has long ceased to be of any individual importance. According to Armenian historians, it dates from the 6th c. B.C., and takes its name from king Vagarsh, who, in the 2d c. A.D., chose it as his residence and surrounded it with walls. According to the legend, the great apostle of Armenia, St. Gregory the illuminator, having seen the Savior descend in a flood of light in the neighborhood of the palace, was ordered by an angel to erect a church on the spot. He observed the divine command in 309, and gave the building the commemorative name of "Edch-Miadzin," or "Descended the Only Begotten." In 344, Vagharshapat ceased to be the Armenian capital, and in the 5th c. the patriarchal seat was removed to Tovin. The monastery was founded by Narses II., who ruled 524–33; and a restoration was effected by Gomidas in 618. At length, in 1441, the primate George or Kevork brought back the see to the original site, and from that day to the present time Etchmiadzin has been the center of the Armenian church. In the Russo-Persian war of 1827, though the monastery was declared neutral territory by both belligerents, it was occupied by Russian troops. (*Encyclopædia Britannica*, 9th ed.)

ETE'OCLES and POLYNICES, sons of Œdipus and Jocasta, cursed by their father for shutting him up in prison. In order to prevent the fulfillment of his prediction that they would engage in fratricidal strife for the throne, they agreed to reign on alternate years. Eteocles, the elder, began, but when his year was up he refused to vacate. Then Polynices, who had married a daughter of Adrastus, king of Argos, headed the famous expedition of the seven against Thebes. The brothers met in single combat and both were slain.

ETESIAN WINDS, a name given by the Greeks to the winds that prevailed for six weeks in summer over the countries near the Mediterranean. They started from the desert regions of torrid Africa, and were hot and dry, but in crossing the Mediterranean they became charged with moisture, and on reaching the n. and e. shores precipitated much-needed rain.

ÉTEX, ANTOINE, b. Paris, 1806; a sculptor, pupil of Dupaty, Pradier, and Ingres. He has traveled in Italy, Algiers, Germany, and England. He also excels in painting, and has published works on the two arts.

ETH'ELBALD, d. 860; King of Wessex; son of Ethelwulf, king of the Anglo-Saxons. Ethelbald formed a conspiracy to seize his father's throne, but was dissuaded on being given the rule of Wessex only. He married his young stepmother, Judith, daughter of the king of France, but the displeasure of the church and of the people compelled them to separate, and she went into a French convent, from which she eloped with Baldwin of the iron arm, and from their union came Matilda, wife of William the conqueror. The reign of Ethelbald was uneventful.

ETH'ELBERT, King of Kent, and fourth in direct descent from the great Hengist, was b. in the year 552, and succeeded to the throne in about the eighth year of his age. The representative of the first Saxon king who ruled in England, and envious on that account of the title of Bretwalda, then enjoyed by Cealwin of Wessex, E. rashly undertook an expedition against that king in 568, a venture which, had he known the

extent of country covered by the West Saxons, he would probably never have made. The rival kings met at Wibbandune, now Wimbledon, in Surrey, where a great battle took place, resulting in the defeat of Ethelbert. This is recorded as being the first battle that ever occurred between Anglo-Saxon sovereigns. Taught by disaster and danger, E. became more prudent. His subsequent schemes were more successful, and, about the year 590, he was acknowledged as Bretwalda of the Saxon octarchy, a dignity which he maintained to the close of his reign and life. In 570, E. married Bertha, a Frankish princess. The lady was a Christian, and it is said had stipulated, as a condition of her marriage, that she should be allowed, after her arrival in Kent, to practice her own religion. Her amiable piety had completely disarmed E. of all violence against the Christian religion long before the most important event of his life took place, viz., the formal introduction of Christianity into his kingdom. This was effected by means of the ministrations of St. Augustine, who was sent to Britain by pope Gregory, and who landed in Kent in 596. In the following year the king himself was converted, and Christianity established among the hitherto pagan Saxons. After his conversion and baptism, he founded the bishopric of Rochester, and, in concert with his nephew Sebert, king of Essex—who also had been converted—erected the church of St. Paul's in London. He died in 616.

E. is also distinguished as the author of the first written Saxon laws. These are the *Dooms*, as they are called by Bede, "which he established with the consent of his Witan in the days of St. Augustine." They are in the Saxon language, and are the earliest written laws that exist in any modern tongue.

ETH'ELBERT, d. 866; King of the Anglo-Saxons. He was a son of Ethelwulf and ruled all the kingdom except Wessex, succeeding to that portion also on the death of his brother Ethelbald. It was during Ethelbert's reign that the Northmen, under the famous Ragnar Lodbrok, ravaged Kent, sacked the city of Winchester, and threatened London.

ETH'ELRED, or ÆTHELRED, I., d. 871; King of the Anglo-Saxons, succeeding his brother Ethelbert. He assumed the rule in 866, and his short reign was greatly disturbed by the forays of the Northmen under the sons of Ragnar Lodbrok. Ragnar had been captured and thrown into a den, where he was stung to death by serpents. His sons vowed vengeance. They seized the city of York and killed the princes who had captured their father; passed the winter in Nottingham, marched into East Anglia, destroyed several monasteries and nunneries, and killed Edmund, the king of East Anglia, of whom the church made a martyr. They were at last defeated by Ethelred, assisted by Alfred (afterwards the great), but two weeks afterwards they defeated Ethelred and Alfred at Basing. Ethelred died of a wound and Alfred became his successor.

ETHELRED, or Æ'THELRED, II., THE UNREADY, 968–1016; King of the Anglo-Saxons; son of Edgar and Elfrida. Careless of everything save his immediate comfort or whim, he and his kingdom were managed by unworthy favorites. In his time the Danes made many conquests in England, and forced Ethelred to purchase peace, to do which he laid upon his people the oppressive tax known as the "Danegeld," which was enforced at times for nearly 200 years. The Danes ravaged all the country around the river Humber, and in 994, aided by Olaf king of Norway, they laid siege to London, but the city was saved through the valor of its people. The Northmen then attacked the southern coasts, but they were hindered by the defection of Olaf, who embraced Christianity and became Ethelred's ally. In the last three years of the 10th c., the Danes ravaged Kent, Sussex, and Wessex. In 1000 the Anglo-Saxon king, disregarding the enemy at home, invaded Normandy, where he was disastrously defeated; but he made a treaty, and married Emma, the daughter of the duke of Normandy. In the spring, he concluded a treaty with the Danes; but, on pretense that they were plotting treachery, the next winter he ordered the murder of all the Danes in England. Among the victims was Gunold, sister of Swend, king of Denmark. Swend was swift in his revenge, and for four years his army ravaged almost at their pleasure in England. In 1007, Ethelred again bought peace for a large sum of money. In 1009, Ethelred collected the "largest fleet that had been seen in the reign of any king," with the intention of driving the Danes from the sea; but the fleet was almost wholly destroyed by a storm; the Danes renewed their ravages, and the English suffered many defeats, until another peace was purchased for money in 1012. The next year Swend, with the largest fleet he had ever collected, sailed up the Humber and marched towards London; but he met such strong resistance that he gave up the plan of attacking the city, and turned off to Bath, where he was proclaimed king of England by the people, who were weary of Ethelred's incompetency and exactions. London soon acknowledged Swend, and the deposed Anglo-Saxon king fled to Normandy. Swend died in the spring of 1014, and Ethelred was re-called on promising to rule better in the future. In the same year he defeated Cnut (Canute), son of Swend, but in 1015 Cnut ravaged a large territory, and was about to attack London when Ethelred died.

ETHELREDA, SAINT, a daughter of the king of the East Angles, in the 7th c. canonized for her saintly virtues, and whose festival in the calendar is Oct. 17. Her name was popularly abbreviated or corrupted into St. Audrey. At a fair in the isle of

Ely, called after her St. Audrey's fair, it was customary to sell a common kind of lace, which came to be known as St. Audrey's lace. *Tawdry*, as applied to any inferior kind of frippery, is believed to be a corrupt use of the term St. Audrey.

ETH'ELWULF, or ÆTHELWULF, d. 858; King of the Anglo-Saxons, son of Egbert. Ethelwulf's reign was mainly occupied in wars against the invading Danes. In 855, E. made a journey to Rome, taking his youngest son (afterwards Alfred the great) to have him consecrated as his successor. In France he married Judith, a daughter of the king of the Franks (afterwards married to Ethelbald, her step-son). In consequence of the preferment of Alfred for succession, the eldest son, Ethelbald, planned a revolt, but was pacified on his father's giving him the kingdom of Wessex. See ETHELBALD.

ETHER (otherwise called ETHYLIC ETHER, VINIC ETHER, and SULPHURIC ETHER) is prepared from alcohol by the action of sulphuric acid at an elevated temperature. On the small scale the apparatus which may be employed for the purpose is the retort and receiver, into which a mixture of equal weights of spirits of wine, or rectified spirit and oil of vitriol, or, by volume, 2 of alcohol and 1 of sulphuric acid, are placed, and heat being cautiously applied, a liquid distils over, which consists of ether and water. In a short time the contents of the retort begin to blacken, and the operation must be stopped or the distillate will become contaminated with sulphurous acid. On the large scale a modification of the process is carried on, which renders it theoretically a "continuous process," though, practically, there is a limit to the amount of ether distilled over.

The conversion of alcohol (C_4H_5O,HO) into ether (C_4H_5O) and water (HO) by oil of vitriol ($HOSO_3$), was at one time considered to be due simply to the strong affinity of the oil of vitriol for water, which enabled it to take possession of the one atom of water, the elements of which form the only difference in the ultimate composition of alcohol and ether. This simple mode of explaining the process of etherification, however, does not acknowledge that the atom of water is not retained by the oil of vitriol, but is given off side by side with the E. in mechanical solution therewith. The theory of the process now generally accepted is too complex for introduction here.

E. is a colorless, transparent, volatile liquid of great mobility and high refractive power, and possessing a fragrant odor, and a fiery, passing to a cooling, taste. When pure, it has the specific gravity 720 (water = 1000) at 60° F., though the commercial specimens are never free from water and alcohol, and have the density 740. It boils at 94.8° F. (the commercial at 96°), and yields a very dense vapor, the specific gravity of which is 2586, as compared with air 1000. When reduced to a temperature of − 24° F., E. freezes. It volatilizes spontaneously when placed in an unconfined position, as in the palm of the hand, and vaporizes so quickly as to produce intense cold. Indeed, when water is covered with E., and the latter assisted in its evaporation by being blown upon, it escapes so readily as to reduce the temperature of the water to 32° F., when it freezes. It is very inflammable, burning with a yellow-white flame; and mixed with air or oxygen, it gives rise to a dangerous explosive mixture, and hence great care requires to be taken in its distillation to keep all lights and fires out of the room where the vapors are condensing. When E. is added to its own bulk of water, briskly agitated, and allowed to settle, the two liquids appear to separate again; but it is found that the E. has taken up one-eighth of its volume of the water, whilst the latter has dissolved the same quantity of ether. It is readily miscible with alcohol in all proportions. E. is one of the best solvents for the oils and fats, and hence is employed in analysis for the solution and separation of the oils from other organic matters, as in the analysis of oil-cakes, etc. It is also a good solvent of iodine, sulphur, phosphorus, and of strychnine, and other alkaloids, as well as of corrosive sublimate, and other salts.

E. is useful in the preparation of freezing mixtures, and the mixture of E. and solid carbonic acid gives rise to the lowest temperature which has as yet been attained. When inhaled by man and the lower animals, E. first produces stimulating and intoxicating effects, but afterwards it gives rise to drowsiness, accompanied by complete insensibility, which entitles E. to be regarded as an important anæsthetic agent; and, indeed, for some time it was the only agent used for producing anæsthesia (q.v.) in operations, but has been entirely superseded by the employment of chloroform.

E. enters into combination with many acids, forming compound ethers, possessing great fragrancy; the more important of which are given in the following table:

Acetic Ether	$C_4H_5O,C_4H_3O_3$	
Butyric Ether	$C_4H_5O,C_8H_7O_3$	Pine-apple Oil.
Caproic Ether	$C_4H^5O,C_{12}H_{11}O_3$	Essence of Melons.
Rutic Ether	$C_4H^5O,C_{20}H_{19}O_3$	Essence of Melons.
Pelargonic Ether	$C_4H_5O,C_{18}H_{17}O_3$,	Essence of Quinces.
Œnanthic Ether	$C_4H_5O,C_{14}H_{13}O_3$,	Wine Oil.

There are other ethers, in which ordinary E. is not one of the members, as

Amyl Acetic Ether	$C_{10}H_{11}O,C_4H_3O_3$,	Jargonelle Pear Oil.
Amyl Valerianic Ether	$C_{10}H_{11}O,C_{10}H_9O_3$,	Apple Oil.
Methyl Salicylic Ether	$C_2H_3O,C_{14}H_5O_5$,	Oil of Winter Greens.

ETHER, sometimes ÆTHER, the name given to the medium which is assumed in astronomy and physics as filling all space. It was shown by Newton, that if light consisted of material particles projected from luminous bodies, these must move *faster* in solids and liquids than in air, in order that the laws of refraction might be satisfied in their motions. Huyghens, on the other hand, showed, that to account for the same laws on the supposition that light consisted in the undulatory motions of an elastic medium, it must move more *slowly* in solids and fluids than in gases. Fizeau and Foucault have lately, by different methods, measured these velocities relatively, and have found Huyghens's prediction to be correct. Light, then, consists in the vibratory motion of a medium, which must, of course, fill all space. This is called ether. As yet, we have no idea as to its ultimate nature; some of our greatest philosophers, even, have supposed that it may be of the class of ordinary gases, and that our atmosphere, for instance, is not finite in extent, but pervades, with greatly reduced density, all interplanetary and interstellar space. Many objections, however, may easily be raised against this supposition. Meanwhile, we may remark, that the mathematical theory of light, on the hypothesis of undulations, requires that the vibrating medium should possess properties more nearly allied to those of an elastic *solid* than those of a liquid or a gas. The E. being *required* for the explanation of the existence and the propagation of light, it becomes a matter of importance to inquire how many more of the physical forces may be referred to the same cause or medium. Radiant heat most certainly may, and, in all probability, gravitation, molecular actions, magnetic, electric, and electro-dynamic attractions and repulsions, are also to be thus explained. As to sensible and latent heat, electricity and magnetism themselves, the necessity is not so clear; but even these have been of late *almost* satisfactorily explained by the hypothesis of the all-pervading ether. See FORCE. In the article just referred to, a good deal more will be found with reference to this subject, and especially with reference to the impossibility of the E.'s consisting of air or other gases, which are made up of distinct and separated particles.

ETHER (*ante*). The ancients had a shadowy idea, or theory it may be called, in regard to the medium which we term cosmic, or luminiferous, ether. The ancient Greeks personified it, Æther being, according to Hesiod, the son of Erebus and Night, and the brother of Day. They also regarded this personification as the representation of the great force of the universe, as well as original matter, which, in a mysterious union with this force, evolved the worlds. The Orphic hymns speak of Æther as the soul of the world, the animator of all things, the great principle of life, the divine essence. The children of Æther and Day were the objects of the visible creation, the heavens with all their stars, the land, the sea. Æther was the lightest and the most active form of matter, and Day had the power of converting it into heavier and visible matter. It seems as though the human mind has the power, given it by the creator, of foretelling great truths afterwards to be demonstrated. Plato spoke of æther as being a form of matter far purer and lighter than air; so light that its weight cannot be ascertained because diffused through infinite space. It would at first appear surprising that the substance which Huyghens found it necessary to assume to demonstrate the laws of reflection and refraction, and particularly of double refraction, should not have been regarded by the greater portion of the scientific world as a reality, as a substance necessary for the performance of many physical phenomena. But Newton's emission theory of light, or, perhaps it may more correctly be said, his elaboration of the emission theory of Descartes, held the belief of the world for nearly a century and a half, and this theory did not require the supposition of such a medium, although both Newton and Descartes conceived of its existence. Huyghens's undulatory theory was so thoroughly founded upon the doctrine of an ether that its opponents were perhaps, in their opposition to his theory, insensibly led to ignore the existence of this medium; for the propagation of light by the emission of particles of matter needed no medium for them to pass through; they could pass through vacuous space, although there were some phenomena which seemed to suggest that the assumption of such a medium would aid in their explanation. But Huyghens's theory required the existence of the medium, although, strange as it may seem, the great mathematician Euler, an advocate of the doctrine of undulations, rejected the doctrine of an ethereal medium. Prof. Grove, a modern British scientist, in his essay on the *Correlation of Physical Forces*, offers the following arguments, here briefly stated, against the doctrine of a cosmic ether. The tendency that the particles of bodies have to fly off into space is so great that it has been impossible hitherto to cause an inclosed space to be void of ponderable matter. Gaseous matter has so strong a tendency to fly off into space that no part of the universe could, after a time, be free from its particles. Again, it must be assumed that light is lost in the interstellar spaces, because, if it were not so, there could be no night, all of the stars being suns. Now, an argument which chimes in with the doctrine of the correlation of physical forces, is that the light from these innumerable suns is transmuted into another force, and this requires the existence of matter in the spaces, such matter as would be furnished by the expansion into space of the aerial matter which envelops the different worlds. The strongest arguments in favor of the belief in a cosmic ether are that it allows of a perfect explanation of all the phenomena of radiation, refraction, diffraction and polarization of light, and that such explanation cannot be made without assuming the existence of such a medium. See HEAT AND LIGHT.

ETH'EREGE, or ETHERIDGE, Sir GEORGE, 1636-89; b. London; educated at Cambridge, and traveled in the continent, where he saw some of Molière's dramas. After the restoration of Charles II. he began to write for the stage, producing first *The Comical Revenge, or Love in a Tub*, which was highly successful. He was at once admitted to the circle of wits and poets of the time, and led a careless and somewhat loose life. By a questionable alliance with Mrs. Barry, the actress, he had one daughter, who died young. Among Etheridge's plays were *She Would if She Could*, and *The Man of Mode, or Sir Fopling Flutter*, in which the chief character was a portrait of Beau Hewit, the Brummel of the period, while he represented in other parts sir Charles Sedley, and also himself. But he fell to gambling and lost his fortune. Then he married a rich widow, and again had money. In 1686, he was appointed resident minister at Ratisbon, where it is said that while conducting a party of friends to the stairs after a banquet he fell over the banisters and broke his neck.

ETHICS, a word of Greek origin, meaning nearly the same thing as the more familiar term morals. The science, treating of the nature and grounds of moral obligation, and expounding our various duties, is called sometimes by the one term, and sometimes by the other. This is a subject wherein opinions so different from each other have been, and are still held, that a writer's task must lie first in explaining what are the chief points in dispute, and next in giving an account of the positions taken up by the opposing schools.

There are two distinct questions connected with the theory of morals. The first is the properly ethical question, and is, what is *the criterion of a moral act?* otherwise expressed as the *moral standard*—the circumstance determining an action to be *right*, and not *wrong*, nor simply indifferent as regards right and wrong. What determines us to single out some conduct as the subject of *moral approbation*, and other conduct as the subject of *moral disapprobation?* We consider murder, theft, breach of promises or contracts, resistance to authority, cruelty, ingratitude, slander, holding of slaves, polygamy, to be wrong, or immoral; and the science of E. is called upon to assign the reason, or reasons, why these various actions are so accounted.

The other question is properly psychological; in other words, relates to the constitution of the human mind. It is, by what *faculty of our nature* do we recognize this difference in actions? Is it by one of our ordinary intellectual faculties, such as reason? or by some of our emotional susceptibilities, as love and hatred? or by a mixed faculty like prudence? or by something peculiar and distinct, relating to this one object and no other, as the eye is formed for recognizing color, and the ear for sound? This question has been often improperly mixed up with the other, although there are certain theories wherein the answer to the first depends on the answer to the second.

As regards the standard of morals, it should be premised that punishment for neglect is what shows an action to be obligatory. We may dislike a man's conduct; but if we do not consider it deserving of punishment, it is not immoral in our eyes. People's imprudences, whereby they hurt themselves alone, are disapproved of; but there is seldom any disposition to step in by way of penalty in order to prevent such conduct; the disapprobation, therefore, is not of the moral kind. The punishment inflicted by society is partly legal, or through the civil government, and partly by public opinion, which, by attaching a stigma to certain conduct, is able to inspire no less dread than the civil authority. The punishment, by society acting in this way, is sometimes called the popular sanction, to distinguish it from the legal sanction. *Dishonor* is another name for the same thing. Many kinds of conduct tolerated by law, are still punished by the loss of public esteem and the infliction of disgrace. Cowardice, eccentricity, heterodoxy beyond certain limits, expose the individual to public censure. Many kinds of inhumanity, as maltreating dependents, have no other check than expressed disapprobation.

There have been various theories to account for the singling out of some actions to be authoritatively forbidden by law and society—that is, forbidden by the sanction of punishment. Some have said that the will of the Deity, or divine revelation, has indicated what we are not to do, and that there is nothing left to us but to conform to what is thus prescribed; others, as Cudworth, maintain, on the contrary, that what the Deity commands must be such as our own conscience approves, otherwise we could not give him the character of being independently good and just. It has been said that right reason shows us the difference between right and wrong; this was Cudworth's own view. Samuel Clarke conceived that there was an eternal and intrinsic *fitness* in the things considered as right, and an unfitness in the wrong, "with a regard to which the will of God always chooses, and which ought likewise to determine the wills of all subordinate rational beings." Both these writers aimed at replying to Hobbes, who had maintained that the civil magistrate is supreme in morality as well as in politics; meaning, however, in all probability, that the magistrate himself ought to frame his dictates in one, as in the other, with a view to the public good, which would be a utilitarian view. The phrase "the moral sense," which now represents perhaps the most prevalent moral theory, occurs first in lord Shaftesbury's *Inquiry Concerning Virtue*, from whom it was adopted by Hutcheson, and has since passed into general currency. Sometimes it has been maintained that a regard to self-interest is the only ultimate rule of right, which

has a very different meaning, according as we look at self exclusive, or inclusive, of other men's wellbeing. The most enlarged benevolence, in one view, is but an aspect of self. Adam Smith, in his *Theory of Moral Sentiments*, laid down as the criterion of right, the "sympathetic feelings of the impartial and well-informed spectator." But although this theory acknowledges our bias in the capacity of agents, it presumes us to be infallible when acting as judges or critics, a position by no means self-evident. The spectator has his own failings as well as the actor, unless specially qualified by nature and education to play the part of a moral judge. But to pass on. Jeremy Bentham is known as the most distinguished propounder of the principle of utility as the basis of morals, a principle explained by him as in contrast, first to asceticism, and next to "sympathy and antipathy," by which he meant to describe all those systems, such as the moral sense theory, that are grounded in internal feeling, instead of a regard to outward consequences. In opposing utility to asceticism, he intended to imply that there was no merit attaching to self-denial as such, and that the infliction of pain, or the surrender of pleasure, could only be justified by being the means of procuring a greater amount of happiness than was lost. Paley also repudiated the doctrine of a moral sense, and held that virtue is "the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness." The utilitarian theory of Bentham, with various modifications, has been defended and expounded by James Mill, in his *Analysis of the Human Mind*, and in his anonymous *Fragment on Mackintosh;* by John Austin, in his *Province of Jurisprudence Determined;* and by Mr. John Stuart Mill in his *Dissertations and Discussions*, and in *Fraser's Magazine* (Oct. to Dec., 1861).

The great controversy may be said to lie between the adherents of the moral sense in some form or other, and those that deny both the existence of a separate faculty in the mind for perceiving moral distinctions, and the validity of the determinations of the individual conscience; maintaining that morality ought to be founded on a regard to the well-being of mankind, and that exclusively; and that rules of morality grounded on any other motives are indefensible. In short, the question is, Is morality an intuition of the mind, or is it, like the government of the state, a positive institution, on which different societies may differ, and which may be set up or abrogated at the pleasure of the society?

The theory of intuitive morality was vigorously assailed by Locke in his *Essay on the Understanding* (book i. chap. 3); and we may venture to say that his objections to what he called "innate practical principles" have never been answered. These objections have been given in a condensed form by Paley (*Moral Philosophy*, book i.). Locke urged that, in point of fact, there are no principles universally received among men; that moral rules require a reason to be given for them, which ought not to be necessary, if they are innate; that virtue is generally approved of, not because innate, but because profitable; that innumerable enormities have been practiced in various countries without even causing remorse; that the moral rules of some nations are flatly contradicted by others; that no one has ever been able to tell what the innate rules are; that we do not find children possessed of any moral rules, etc. It has been attempted to reply to the objection, founded on the great variety and opposition of moral rules in different places and times, by saying that although the substance of the moral codes differ—one part of the world being monogamous and chaste, while other nations allow promiscuous intercourse of the sexes—all agree in enjoining some moral rules; nowhere is there an absence of social and moral obligations. But this is to depart from the original question, which was to assign the standard of morals, the criterion for determining which of two opposite courses—monogamy or polygamy—is the correct or moral course. The intuitive moralists say that human nature is endowed with an instinct which at once approves the right and disapproves of the wrong, and that we need go no further than our own conscience to settle the point. Now, when the existence of contradictory consciences is pointed out, it is not to the purpose to say that these are still consciences, and indicate something as obligatory; this all admit: what we desire is to determine which we are to follow.

Dr. Whewell, in his *Elements of Morality*, has proposed a way out of this serious difficulty by setting up a supreme or standard conscience, by which the individual conscience may be squared and corrected; but he has not told us who are the men whose conscience is the standard; it being obvious that the human race, as a whole, do not recognize any such, although each separate community might consent to take some of its most estimable citizens, or the interpreters of its religious code, as models to conform to.

The following is one view of the nature and origin of our moral principles which would seem free from the grave objections above alluded to. If we set aside for the present the question as to the *proper* standard of morals, the criterion that we should consider the right criterion, if we had to enact a code of morals for the first time, and if we look at the moral principles that have prevailed in different nations and times, we shall find that they have been dictated from two distinct kinds of motives. The one is utility, in the sense of the common safety of men living in society. The prohibitions against manslaying, theft, breach of bargain, rebellion, are necessary, wherever men have formed themselves into communities; and it is the agreement in such matters as these—although subject still to very great varieties—that makes up the amount of

uniformity actually observed in the moral codes of nations. If the society did not agree to protect life and property, by punishing the murderer and the thief, nothing would be gained by coming under the sway of government, and human beings would not be got to associate themselves in tribes or nations. The common end gives a common character to the means, without supposing a special instinct to suggest that stealing is wrong. But, in the second place, there have been, in the moral codes of all countries, prohibitions not connected with any public utility, but prompted by strong sentimental likings or aversions, which have acquired the force of law, and are made the foundation of compulsory enactments. Of this kind is the antipathy of the Jew and the Mohammedan to the pig, the Hindoo repugnance to animal food generally, and the usages of a merely ceremonial kind prevailing among many nations, which are as stringently enforced by law and public opinion as the sacredness of life and property. For a woman, among the Mussulmans, to expose her face in public, is as great an offense as going naked would be with us; while, among savage tribes, in warm climates, where clothing is little required, it is no shame to expose the whole person. For these practices, no reason can be given; the public sentiment has determined some things to be right and others wrong, without reference to any public or private utility; and it is in these enactments, founded on liking or disliking, that nations have differed most widely, the difference often amounting to contrariety. The ancient Greeks held it as a sacred obligation to drink wine in honor of Dionysus (Bacchus); the Nazarenes among the Jews and the Mohammedans entertained an opposite view. A legislator for the North American Indians might prohibit alcoholic liquors on the ground of public utility, the natives not being able to control themselves under stimulants; but the prohibition of wine in those other instances is probably a species of asceticism, or an aversion to human pleasures as such, which belongs to the domain of sentiment, and not to the consideration of utility.

Looking at the many capricious injunctions that owe their origin to fancies such as these, it may be doubted whether the human race can ever gain anything by departing from the principle of utility as the sole criterion of good morality; and there is an increasing tendency to recognize the supremacy of this principle both in morals and in legislation. Justice, truth, purity, although sometimes viewed sentimentally, or as being ends themselves, are in men's practice looked upon more and more as of the nature of *means*, the promotion of human happiness being the end.

A great number of the existing moral rules can be traced to a distinct historical origin, proving still more decisively that they are not the suggestions of a universal instinct of the human mind. The Mohammedan code of morals came from Mohammed; Confucius was the moral legislator of one large section of the Chinese. The making of the marriage tie irrevocable in Christendom was an exercise of papal authority in the 13th c., and has since been repealed in some Protestant countries, although retained in Catholic states. See DIVORCE, MARRIAGE. The sentiment which forbids the holding of human beings as slaves is chiefly the growth of the last two or three centuries.

Although the doctrine of intuitive morality is, in this view, denied, it is still admitted that there is such a power in the mind as conscience, which warns us when we are doing wrong, and is to a certain extent a force to make us do right. But it cannot be shown that we are born with any such principle, combining both enlightenment and motive power. Conscience is a *growth*. There are in our constitution certain primitive impulses that so far coincide with what is our duty, and therefore contribute to the formation of the conscience; these are principally self-preservation, or a regard to ourselves, and sympathy, or a regard to others. There are many duties that we are prompted to for our own interest, such as telling the truth, in order that people may confide in us; obeying the laws, to avoid punishment, etc. But we cannot perform all our social duties if we look merely to ourselves. We must, in addition to prudence, have a source of *disinterested* action, inducing us both to avoid injuring our fellow-beings in the promotion of our own selfishness, and occasionally to sacrifice ourselves for the sake of others. Such a principle exists in our mental nature, although not of equal strength in all minds. Being provided with these two primitive springs of action, we are susceptible of being educated to the sense of moral obligation. The child is first taught obedience by penalties, and is made to associate pain with forbidden actions. This is the germ of conscience. Habits of avoiding what is prohibited under penalties are gradually formed, and the sense of authority and law is thereby acquired. When the powers of observation and reason come to maturity, the individual sees why the restrictions of duty have been imposed, and is then ready of his own accord, and apart from the fear of punishment, to behave rightly. The conscience, grounded on fear, then becomes the conscience grounded on spontaneous approval.

Conscience thus follows, and does not precede, the experience of human authority. Authority, sanctioned by punishment, is the type and the starting-point, even when the conscience takes an independent flight, and adopts rules for itself different from those that entered into its education. The great mass of human beings have nothing more than the slavish conscience, or the habits imparted by the exercise of the parental and public authority, which shows what is the most natural foundation of moral sentiment. The persons that judge of right for themselves, instead of implicitly receiving the maxims peculiar to the society where they grow up, are so few as to be

the exception everywhere; their conscience does not prove what is the usual endowment of human nature in this respect.

Inquiries of the nature of those above sketched, proceed upon the assumption that moral distinctions have their ground in the constitution of the world and of man's nature, and may be discovered by the exercise of human reason, as the other laws of the universe are. But practically, the rules of morality have, in almost all communities, been more or less dependent upon a belief in divine laws supernaturally revealed. The relation of these to scientific ethics will be considered under REVELATION.

ETHIO'PIA, the Biblical *Kush*. Originally, all the nations inhabiting the southern part of the globe, as known to the ancients; or rather, all men of dark-brown or black color, were called Ethiopians (Gr. *aithō—ōps*, sunburned). Later, this name was given more particularly to the inhabitants of the countries s. of Libya and Egypt, or the upper Nile, extending from 10° to 25° n. lat., 45° to 58° e. long.—the present Nubia, Sennaar, Kordofan, Abyssinia. The accounts which the ancients have left us with respect to this people are, even where they are not of an entirely fabulous nature, extremely scanty and untrustworthy, as both Greeks and Romans never got beyond Napata, 19° n. lat. We will just mention that from the Homeric age down to Ptolemy—who is somewhat better informed—these regions were peopled by Pygmies, Troglodytes (dwellers in caverns), Blemmyes (hideous men), Macrobii (long-lived men), etc., besides being divided into the land of cinnamon, myrrh, of elephant-eaters, fish-eaters, tortoise-eaters, serpent-eaters, etc. The only portion of ancient records which does contain something akin to historical accounts, is that which refers to Meroë, an island formed by the rivers Astaphus and Astaboras, tributaries of the Nile. There stood, from times immemorial, an oracle of Jupiter Ammon. This, and the central portion of the island, together with the extraordinary fertility of its soil, the abundance of animals, metals, etc., made it not only the chief place of resort for all the inhabitants of the adjacent parts, especially the numerous nomad tribes, but also the emporium for India, Arabia, Ethiopia, Egypt, Libya, and Carthage. Thus it grew so rapidly, that about 1000 B C. it counted among the most powerful states of the ancient world; and about 760, having ever since Sesostris been tributary to Egypt, it succeeded, under Sabacus, in shaking off the Egyptian yoke, and continued, in its turn, to hold Egypt for about sixty years. During the reign of Psammetichus, 240,000 Egyptians settled in Meroë, which, the greater part of the immigrants being artisans, traders, etc., rose still higher. Many new cities were built, and the state was in the most flourishing condition, when it was conquered by Cambyses, about 530 B.C. He fortified the capital town, and called it Meroë. After the destruction of Thebes by Cambyses, most of the inhabitants of that city took refuge there, and made the country still more Egyptian. Ergamanes transformed its theocracy into a military monarchy, in the 3d century. Under Augustus, Meroë was conquered, and a queen Candace is mentioned as his vassal. Under Nero, nothing but ruins marked the place of this once powerful and highly civilized state. Up to this day, remnants of mighty buildings, covered with sculptures—representations of priestly ceremonies, battles, etc.—and half-defaced inscriptions hewn in rocks, besides rows of broken sphixnes and colossi, are frequently met with in those parts.

Their religion, art, form of government, and civilization, generally being—in their chief features at least—so identical with the Egyptian as to have given rise to the question, which of the two nations imparted their knowledge to the other, we will refer the reader for these points to the article EGYPT; and will proceed now to say a few words on the history of the descendants of the ancient Ethiopians—the inhabitants of the present Habesch, or Abyssinia—as we derive it from their poor and scanty native chronicles.

According to these, the son of Solomon and the queen of Sheba (Makeda as they, Balkis as the Arabian historians call her), named Menilehek, was the first king of the Ethiopians. Few kings' names occur up to the time of Christ, when Bazen occupied the throne. The missionary Frumentius (330) found two brothers (Christians) reigning—Abreha and Azbeha. During the time of the Greek emperor Justin (522), king Elezbaas destroyed the state of the Homerites in Asia, in order to revenge their persecutions of Christians; and was canonized. From 960 to 1300, another dynasty, the Zagoean, held the chief power, all the members of the Solomonic dynasty, save one, having been mudered by Esal, who made her son king. In 1300, Ikon-Amlak, a descendant of this one scion of the house of David, who had fled to Sheba, regained possession of the country, and made Sheba, instead of Axum, the seat of government. To this day, his family rules the country. Frequent revolutions within, more especially brought about by the religious squabbles imported by the Portuguese towards the end of the 15th c., and a host of enemies all around—the most formidable of whom were wild nomad tribes of the desert—forced the kings more than once to apply for foreign help; amongst others, that of the Turks in 1508; and the affairs of the modern state have at all times been anything but prosperous. Special mention is made of king Zara-Jakob (Constantine), 1434–68, who sent an embassy to the church-council at Florence; of Aznaf-Saged (Cladius), 1540–59, during whose reign Christoph. de Gama from Portugal lived in E., and made common cause with him against his enemies. This king also wrote a confession of faith, in which he defended his church both against Jesuits and the charge

of leaning towards Judaism. Socinios (1605–32) openly professed Roman views; but his son Facilides soon expelled the Jesuits and their friends from the country, and put an end to the Roman influence. Among these friends was also Abba Gregorius, later the friend of the great Ethiopologist Ludolf, who, having made his acquaintance at Rome, induced him to migrate to Gotha; where he also remained until his death. Under Joas (1753–69), the Gallas, a nomad tribe, hitherto the mightiest and most dangerous enemies of the Ethiopians, not only gained admission to all the offices in the state, but acquired almost absolute power. One of them (Susul Michael), holding the place of râsh, or prime minister and chief commander of the troops, proved a very great friend to Bruce, to whom he also intrusted the government of a province. The several provinces remained practically independent, each chief striving to subdue his neighbors, till in 1855, the chieftain afterwards known as Theodore (q.v.) attained supremacy. See also art. Abyssinia. The king resided but rarely in the city, and for the most part remained with his soldiers in the camp. His official name was Negus, or in full, Negus Nagass Za-itjopja, king of the kings of Ethiopia—alluding to the chiefs of the towns and provinces. The soldiers receive no pay, but rely on plunder; and have proved themselves able to fight bravely.

Emigrants, as were beyond doubt the earliest settlers in E., from the other side of the Arabian isthmus, it is but natural that the structure of their language, as well as that of their own bodies, should bear traces of their Shemitic origin. The reason of this emigration is contained in the very name of this language, which is called *Geez*—free, affording a most striking parallel to the designation *Franc*—French. Free places of habitation were what they came in search of. The name Ethiopian, or, as they call it, Ithiopjawan, they adopted from the Greeks at a very late period. This their oldest language, *Leshana Geez*, was suppressed by a royal decree of Ikon-Amlak, in the 14th c., and the Amharic adopted as the court language. Ever since, it has, with exception of the province of Tigré, where it is still spoken (with slight idiomatic changes), remained the *Leshana Mazhaf*, the language of books and of the church. It is exclusively used in writing, even of ordinary letters, and the educated alone understand it. Its general structure comes as close to that of the Arabic as a dialect can and must. A great many of its words are still classical Arabic; others resemble more the Hebrew and its two Chaldee dialects, the Aramaic and Syriac; others, again, belong to African dialects; and many, as the names of the months, are Greek. It has 26 letters, 22 of which bear the ancient Shemitic stamp, and exhibit the greatest likeness to the Phenician, the common original alphabet; and seven vowels, including a very short *e*, which sounds precisely like the Hebrew Schĕwa. These vowels are represented by little hooks, and remain inseparably attached to their respective letters; and as the Geez, unlike all its sister-languages, is never written without vowels, the alphabet becomes a syllabary with 182 characters. Another difference exists in its being written from left to right—a circumstance from which some have concluded that the Greeks introduced writing in E.; forgetting, in the first place, that Greek itself was frequently written from right to left, and that Zend, certain cuneiferms, hieroglyphs, etc., are likewise written from left to right. We cannot enter here into the grammatical minutiæ of the language; we will only mention that out of the ten conjugations, eight are Arabic; that there is a double infinitive, but no participle and no dual; that the formation of the so-called plural, and of declension generally, point to that very remote period when the Hebrew and Arabic made use of the same grammatical processes. There are no diacritical marks employed in writing; the letters are not combined, and the words are separated by two dots.

Although there can be no doubt of the existence of a rich literature in a flourishing country like E. anterior to Christ, still, owing both to frequent internal convulsions, and the misguided zeal of the early Christian missionaries, who here and elsewhere considered it their first duty to destroy all the ancient records of which they could get hold, nothing but a few half-erased inscriptions have survived. The earliest existing document of post-Christian literature is a complete translation of the Bible, probably by Frumentius. See Frumentius. The Old Testament, probably a translation from the Alexandrine version of the LXX., consists of four parts: 1, the Law or Octateuchos (five books of Moses, Joshua, Judges, Ruth); 2, Kings; 3, Solomon; 4, Prophets, and two books of the Maccabees. The New Testament consists of—1, Gospels; 2, Acts; 3, Paulus; 4, Apostolus. A very peculiar book, Henoch, belongs also to the literature of the Old Testament. See Enoch. The New Testament comprises likewise another book, Senodas, containing the pseudo-Clementine or apostolical constitutions. The Ethiopians have a liturgy (*Kanon Kedaso*—Holy Kanon) and a symbolico-dogmatical work (*Haimanota Abau*—Belief of the Fathers), containing portions of homilies of the Greek fathers, Athanasius, Basil the great, Chrysostom, Cyril, Gregory of Nyssa and Nazianzen. Besides these, they have martyrologies, called Synaxar. They employ in this their sacred literature a peculiar kind of rhythm without a distinct meter. Any number of rhyming lines forms a stanza, without reference to the number of words constituting the verse, or of verses constituting the stanza. They also use certain phrases as a refrain—not unlike the manner of the mediæval Hebrew Pizmon. See Jewish Liturgy. As to general literature, they have neither a written book of laws, nor a grammar of their own language, nor, in fact, anything worth mentioning, except a *Chronicle of Axum* and *Chronicles of Abyssinia*. They are very fond, however, of riddles, wise saws, and

the like, so fascinating to the eastern mind. They have a dictionary, but most of its explanations and translations are utterly wrong. No wonder the learned in Europe should have been sorely puzzled by such a language, and that they should, after long consideration, have pronounced it to be either "Chaldee" or "Indian," while Bruce held it to be the language of Adam and Eve. Potgen, a Cologne church-provost, happening to be at Rome at the beginning of the 16th c., there made the acquaintance of native Ethiopians, and became the first to enlighten the world on the nature of this occult language. After him came the Carmelite Jacob Marianus Victorius, from Reate, who wrote *Institutiones Linguæ Chaldææ S. Æthiop.* (Rome, 1548), an entirely worthless book; then Wemmers, who in 1683 published an Ethiopian grammar and dictionary. The principal investigator, however, is Hiob Ludolf from Gotha, who, aided by the Abba Gregorius, before mentioned, and supported by his own extraordinary linguistic talents and indomitable energy, acquired such a power over this language, that notwithstanding the number of eminent Orientalists, such as Platt, Lawrence, Dorn, Hupfeld, Hoffmann, Roediger, Ewald, Isenberg, Blumenbach, etc., who have since worked in this field, his books, as re-edited by Dillmann, still hold the first place. It is hardly necessary to add, that the Ethiopian is one of the most important and indispensable languages to the Shemitic scholar, containing as it does a great many words and forms of a date anterior to the separation of the different Shemitic dialects. Among the most important Ethiopian books printed in Europe are the Psalms, edited with a Latin translation by Ludolf (Frankfort, 1701); the New Testament, in two volumes (Rome, 1548); the book of *Henoch* (Lond. 1840); *Ascensio Isaiæ Vatis*, with a Latin translation by Lawrence (Oxford, 1819); *Didascalia*, or apostolical constitution of the Abyssinian church (Lond. 1834).—Ludolf's works are *Grammatica Æthiopica* (Lond. 1661; new ed. by Dillmann, 1857); *Lexicon Æthiopicum* (Frankfort, 1699); new ed., 1862); *Historia Æthiopica* (1681). Since the English expedition to Abyssinia, the British museum possesses a larger number of Ethiopic MSS. than any other library.

ETHIOPS, or **ÆTHIOPS** (Gr. *aithō*, I burn, and *ops*, countenance; being of a black or burned countenance), is a term applied by the ancient chemists to certain oxides and sulphides of the metals which possessed a dull, dingy, or black appearance. Thus, *ethiops martialis* was the mixture of protoxide and peroxide of iron, known as the black oxide; *ethiops mineral*, or *ethiops narcoticus*, the black-gray sulphuret of mercury procured by triturating in a mortar a mixture of mercury and sulphur; and *ethiops per se*, was obtained by agitating commercial mercury for weeks or months, when the oxygen of the air slowly formed the black oxide of mercury.

ETHMOID BONE, THE (so called from *ēthmos*, a sieve), is one of the eight bones which collectively form the cavity of the cranium. It is of a somewhat cubical form, and is situated between the two orbits of the eye, at the root of the nose. Its upper surface is perforated by a number of small openings (whence its name), through which the filaments of the olfactory nerve pass downwards from the interior of the skull to the seat of the sense of smell, in the upper part of the nose. It consists of a perpendicular central plate or lamella, which articulates with the vomer and with the central fibro-cartilage, and thus assists in forming the septum or partition between the two nostrils. The lateral masses present a very complicated arrangement, and are so planned as to give in a small space a very large amount of surface, on which the filaments of the olfactory nerve are spread. In comparative anatomy, we find a direct ratio between the development of these masses and the acuteness of the sense of smell. See NOSE AND THE SENSE OF SMELL.

ETHNOGRAPHY, a term closely allied to ethnology (q.v.). Ethnography embraces the details, and ethnology the rational exposition, of the human aggregates and organizations known as hordes, clans, tribes, and nations, especially in the earlier, the savage, and barbarous stages of their progress. Both belong to the general science of anthropology (q.v.), or the natural history of mankind, being related to it as parts to a whole. Ethnography and ethnology, indeed, run up into anthropology as anthropology does into zoölogy, and zoölogy into biology. No very sharp line can be drawn between these two sciences themselves, their differences being mainly those between the particular and the general, between the orderly collection of local facts, and the principles according to which they may be grouped and interpreted. Ethnographists deal with particular tribes, and with particular institutions and particular customs prevailing among the several peoples of the world, and especially among so-called savages. Ethnologists bring simultaneously under review superstitions, legends, customs, and institutions which, though scattered in distant regions of the earth, have some common basis or significance. Ethnography and ethnology run as easily one into another as the two sections of general anthropology, viz.: 1, anthropology proper, as expounded by anatomists and physiologists, who deal with the different races of men, their elements, modifications, and possible origin; and, 2, demography, which, as constituted by the researches of Quetelet and his friends and disciples, as Farr, Galton, Guillard, and Bertillon, treats of the statistics of health and disease, of the physical, intellectual, physiological, and economical aspects of births, marriages, and mortality. Ethnography, ethnology, and anthropology are interwoven with philology, jurisprudence, archæology, geography, and the various branches of history. A fact may require to be investigated successively by linguists,

anatomists, and mathematicians. In current language, ethnography and ethnology are often used indiscriminately; but if a distinction be made between them, an instinctive perception teaches us to speak of ethnographic facts and ethnological theories, of ethnographic literature and ethnological science—ethnology being related to ethnography as the wine to the grape.

ETHNOLOGY (Gr. *ethnos*, nation or race, and *logos*, discourse), a term applied to the science that treats of the persistent modifications of the human family or group; their most marked physical, mental, and moral characteristics when compared one with the other; their present geographical distribution on the globe; their history traced backwards to the earliest attainable point; and, finally, the languages of the various nations and tribes of mankind, existing or extinct, classified and compared, with the view, by their means, of determining the chief points of resemblance or dissimilarity among the nations of the earth. This science has gradually outgrown its name. It has been therefore deemed expedient to apply to it a term of wider and more neutral significance—namely, anthropology—derived from the Greek *anthropos*, man, and *logos*, a discourse. The term *ethnology* has this inconvenience, that it means no more than the "science of races," and many authorities not only deny the existence of *races* of mankind, affirming that what are called races are in reality distinct species, but others argue that the term is as applicable to any races—e.g., races of dogs, or cats, or pigeons—as to the races of mankind. Hence the more exact and less sectarian term anthropology has been applied to denote the science that treats of the natural history of man. The science is divided into three branches—1. *Zoölogical anthropology*, which treats of the relations of man to the brute creation; 2. *Descriptive anthropology*, or ethnography, which classifies and describes the various divisions and subdivisions of mankind, and marks out their geographical distribution; 3. *General anthropology*, which M. Broca calls "the biology of the human race," which, says a recent writer on the subject, "borrows and collates from all sciences facts and phenomena usually investigated in men as individuals, but which relate to men as groups of individuals," and compares these with other facts relating to other groups of individuals. The study and bare description of a single negro's skull is mere human anatomy; the study of a group of negroes' skulls, and the description and comparison of their peculiarities with those of groups of skulls belonging to other races, would be a specimen of the work done by general anthropology.

No one can look at an Englishman, a red Indian, and a negro, without at once noticing the differences between the three, not only as regards the color of their skin, but the shape of the skull, the texture of the hair, and the character of the several features, as eyes, lips, nose, and cheek-bones. What strikes the ordinary observer chiefly is, of course, the difference of complexion; but the anatomist is fully as much interested in the shape of the skull. The first thoroughly scientific writer who endeavored to lay down a method of distinguishing between the different races of mankind by a comparison of the shape and size of the skull was Peter Camper, a distinguished Dutch anatomist of last century. He laid down a technical rule for ascertaining the *facial line*, and determining the amount of the *facial angle*, which he has thus described: "The basis on which the distinction of nations is founded may be displayed by two straight lines, one of which is to be drawn through the *meatus auditorius* to the base of the nose, and the other touching the prominent center of the forehead, and falling thence on the most advancing part of the upper jaw-bone, the head being viewed in profile. In the angle produced by these two lines may be said to consist not only the distinctions between the skulls of the several species of animals, but also those which are found to exist between different nations." The heads of birds display the smallest angle, and it apparently becomes of greater extent "in proportion as the animal approaches more nearly to the human figure. Thus, there is one species of the ape-tribe in which the head has a facial angle of 42 deg.; in another animal of the same family, which is one of those simiæ most approximating in figure to mankind, the facial angle contains exactly 50 deg. Next to this is the head of the African negro, which, as well as that of the Kalmuck, forms an angle of 70 deg.; while the angle discovered in the heads of Europeans contains 80 deg. On this difference of 10 deg. in the facial angle, the superior beauty of the European depends; while that high character of sublime beauty which is so striking in some works of ancient statuary, as in the head of Apollo, and in the Medusa of Sisocles, is given by an angle which amounts to 100 deg." The nearer the facial angle approached a right angle, the greater was held to be the intellectual development of the race. But M. Jacquart, of the natural history museum in Paris, showed that the facial angle in stupid people very often approached closely a right angle, and that, in the homogeneous population of Paris, the facial angle varied within wider limits than those Camper stated as a criterion of distinct species.

Camper's method was abandoned for the vertical method, or *norma verticalis*, invented by Blumenbach. The object being to collect the greatest number of characteristics—"The best way," says Blumenbach, "of obtaining this end is to place a series of skulls with the cheek-bones on the same horizontal line resting on the lower jaws; and then viewing them from behind, and fixing the eye on the vertex of each, to mark all the varieties in the shape of parts that contribute most to the national character,

whether they consist in the direction of the maxillary and malar bones, in the breadth or narrowness of the oval figure presented by the vertex, or in the flattened or vaulted form of the frontal bone." Founding upon this mode of admeasurement applied to a large collection of skulls of different nations, accumulated by himself, Blumenbach classified the human family into the following five varieties—viz., the Caucasian, Mongolian, Ethiopian, Malay, and American. In the first of these—which he made to include the Caucasians or Circassians proper, the Celts, the Teutons, the Shemites, the Libyan family, the Nilotic family, and the Hindustanic family—the skull is large and oval, the forehead expanded, the nasal bones arched, the chin full, and the teeth vertical. In the second—which embraces the Chinese and Indo-Chinese, the natives of the polar regions, the Mongol Tartars, and the Turks—the skull is oblong, but flattened at the sides, the forehead low and receding, the nose broad and short, and the cheek-bones broad and flat, with salient zygomatic arches. In the third—embracing the Negroes, Kafirs, Hottentots, Australians, Alforians and Oceanic Negroes—the skull is long and narrow, the forehead low, the nose broad and flat, the cheek-bones prominent, the jaws projecting like a muzzle, the lips thick, and the chin small. In the fourth—embracing the Malays and Polynesians generally—the skull is high and square, the forehead low, the nose short and broad, and the jaws projecting. In the fifth—embracing the American family and the Toltican family—the skull is small, with the apex high, and the back part flat, the forehead receding, the cheek-bones high, the nose aquiline, the mouth large, and the lips tumid.

This classification of the human family, with the added characteristics, under each class, of complexion, hair, and eyes, is, upon the whole, the most popular, Blumenbach having taken considerable pains to elaborate it, and present it to the world in a form acceptable to scientific inquirers. Later researches, however, have proved it to be not quite tenable. Thus, Cuvier reduced the five classes of Blumenbach to three—viz., the Caucasian, Mongolian, and Ethiopian, treating the Malay and American as subdivisions of the Mongolian. Jacquinot does the same. Dr. Prichard, who brought to the study of E. not only a large acquaintance with physiology, but a considerable knowledge of languages, admits a greater number of varieties than Blumenbach, but divides his Caucasian class into two independent groups, which he calls the Syro-Arabian or Semitic, and the Aryan or Indo-Germanic. Moreover, he objects to the term Caucasian, as representing the notion that mankind had their origin on mountain heights. For himself, Prichard holds with the view that it was rather on the banks of large rivers and their estuaries that the primitive nations developed themselves. "The cradles or nurseries of the first nations, of those at least who became populous, and have left a name celebrated in later times, appear to have been extensive plains or valleys, traversed by navigable channels, and irrigated by perennial and fertilizing streams. Three such regions were the scenes of the earliest civilization of the human race, of the first foundation of cities, of the earliest political institutions, and of the invention of the arts which embellish human life. In one of these, the Semitic or Syro-Arabian nations exchanged the simple habits of wandering shepherds for the splendor and luxury of Nineveh and Babylon. In a second, the Indo-European or Japetic people brought to perfection the most elaborate of human dialects, destined to become in after-times, and under different modifications, the mother-tongue of the nations of Europe. In a third, the land of Ham, watered by the Nile, were invented hieroglyphical literature, and the arts in which Egypt far surpassed all the rest of the world in the earlier ages of history." Dr. Prichard, in his well-known *Natural History of Man*, commences with a description of these three divisions of the human race, not as discriminated one from the other by the form of the skull, but as comprising nearly all the civilized communities, and indeed most of the tribes of people known to antiquity. "They were neither nomades nor savages, nor do they display in their crania either of the forms principally belonging to races in those different states of existence. They had all heads of an oval or elliptico-spherical form, which are observed to prevail chiefly among nations who have their faculties developed by civilization." As they cannot, however, by any means be made to comprehend all the types of man, after the Egyptians, he describes the great body of the nations of Africa, embracing tribes sunk in the lowest state of degradation; and after the Ayrans, or Indo-Europeans, the people of high Asia, chiefly nomades, inhabiting vast steppes, and never rising in the scale of civilization beyond the condition of wandering shepherds, though in this capacity possessing some wealth, and acquainted with the use of clothing, tents, and wagons. "These classes of nations," he observes, "have different physical characters. Among the African savages we find the *prognathous* form of the head and all its accompaniments; and these traits display themselves in proportion to the moral and physical degradation of the race. In Northern Asia, most of the inhabitants have the pyramidal and broad-faced skulls." Referring our readers to the articles ARYAN RACE, EGYPT, and SHEMITIC NATIONS respectively, for more detailed information on the subject of these three grand divisions of mankind, we shall here only notice Dr. Prichard's subdivisions of one of them, namely, the Aryan race.

The great Aryan or Indo-European race, which extends itself from the mouth of the Ganges to the British islands and the northern extremities of Scandinavia, divides itself, according to Prichard, into two branches—viz., the parent stock in Asia, and the colonies that it successively sent forth into Europe. The Asian branch comprises: 1. Hin-

dus; 2. Persians; 3. Afghans; 4. Baluchi and Brahui; 5. Kurds; 6. Armenians; and 7 Ossetines. The collective body of the European nations are now generally regarded as a series of colonies from Asia. The proof turns mainly on a comparison of languages; the ancient Sanscrit being regarded by the most competent judges as the parent not only of the Greek and Latin languages, but of the Teutonic, with its several ramifications of the Slavonic, Lettish, Lithuanian, and even Celtic. Dr. Prichard himself was the first to point out the affinity of the Celtic with the Sanscrit, Greek, Latin, and Teutonic, in a memoir published by him in 1831, on the *Eastern Origin of the Celtic Nations*. Later philologers have confirmed the view taken by him, and he is perhaps correct also in the conclusion, that they were the first great immigration of the Aryans into Europe, who were afterwards conquered, and their numbers considerably reduced by fresh advancing colonies from the same parent hive. But there are other nations or tribes of Europe which no efforts of the philologists have succeeded in tracing to the Aryan stock; such are the Lapps, Finns, Tschudes, and Ugrians of the n., and the Euskaldunes, now principally represented by the Basques in the west. To these, Dr. Prichard has given the appellation of Allophylian (Gr. *allos*, another, and *phule*, tribe), thereby signifying their independence of the Aryan stock. The progenitors of these tribes were probably the inhabitants of Europe, prior to the first Aryan immigration.

After these several races, Dr. Prichard treats of the native tribes of the austral seas and the great Southern ocean, and finally, of the native inhabitants of America. In every case, he carefully describes the physical appearance or structure, the geographical *habitat*, history, and migrations (if any), the language, and the moral and psychical attributes of the nation or tribe immediately brought under notice. His information has generally been obtained from the best sources, and hence his works may be regarded as a storehouse of knowledge upon the subject of ethnology.

But both before and since Blumenbach and Prichard, there have been several classifications of the human race proposed, the simplest of which is perhaps that of Dr. Latham, into 1. Mongolidæ; 2. Atlantidæ; 3. Japetidæ. This writer is properly regarded as the chief living exponent of the science of E. in this country. Following in the track of Prichard, and possessing, like him, a considerable acquaintance with physiology and history, he distances him altogether in the department of comparative philology. His contributions to the science of E., borrowed from this particular branch of study, are consequently of the highest value. But there is one important question, with respect to which the suffrages of the best philologers are rather with Prichard than with Latham —viz., the origin of the Aryan or Indo-European race. Prichard, as we have seen, refers it to Asia, while Latham claims it for Europe.

Retzius's classification is based on the idea that the psychical individuality of a race is expressed by brain-development as indicated by the shape of the skull. He divides races into—I. Dolichocephalic, or long-skulled races, where the length of the skull is due to a lengthening of the posterior lobes of the brain, and II. Brachycephalic, or short, broad-skulled races, in whom the comparative shortness of these lobes causes them to be more developed in breadth. These are subdivided, according to the form of the face, into (1) orthognathous, or straight-faced peoples; e.g., Europeans; and (2) prognathous, or races with projecting jaws, e.g., Negroes. This classification laid the foundation of ethnographic craniology. Zeune divides mankind into—(1) races with high skulls, e.g., Indo-Europeans; (2) races with broad skulls, e.g., Mongols and some Malay tribes; (3) races with long skulls, e.g., Negroes. Such classifications err in grouping under the same divisions races between which it is otherwise impossible to establish any consanguinity. Passing over the wild speculative classifications of the modern German materialistic school, a specimen of which is that of Carl Vogt, who, assuming the ape origin of mankind to be an indubitable fact, describes three great divisions of the human race in correspondence with the three species of anthropomorphic apes found in Asia, Africa, and America, the only other very recent classification with pretensions to scientific reasonableness, is that of prof. Huxley, which is founded on the hair as a race-character. He describes two primary divisions—I. Ulotrichi, crisp or woolly-haired people, with skulls longer than they are broad (dolichocephalic), and with the skin-color varying from yellow to black. Negroes, Bushmen, and Malays are subdivisions of this great group. II. Leiotrichi, or smooth-haired people, subdivided into (1) the Australoid group, with "dark eyes, wavy black hair, and eminently long, prognathous skulls, with well-developed brow ridges;" (2) the Mongoloid group, e.g., Chinese, Tartars, Polynesians, and American aborigines; (3) The Xanthocroic group, fair, blue-eyed people, e.g., Sclavs, Teutons, Scandinavians, and fair, Celtic speaking nations; (4) The Melanocroic group, or pale-skinned people, with dark hair and eyes, e.g. the Iberians, or "black Celts" of Europe, the inhabitants of the Mediterranean coast and of western Asia—a group resulting probably from intermixture of the Australoid and Xanthocroic races. Under the Australoid group is classed such apparently unrelated races as the Australians, the Dekhan tribes in India, and the ancient Egyptians; and curiously enough, col. Lane Fox has since shown that, from resemblances in the weapons, implements, etc., in use amongst these very races, prof. Huxley's apparently startling views as to their affinity are not at all improbable.

A more important question is, what do classifications classify—species or varieties? Prichard held that mankind sprung from one stock, and constituted one species. Exi-t

ing diversities in form and physique in races he accounted for by the influence of food, climate, and other circumstances operating through a long series of years. Mr. Darwin's recent work on *Animals and Plants under Domestication* powerfully corroborates this view, for it demonstrates that within the limits of one admitted species of animal there may be produced, by the operation merely of artificial selection and hereditary transmission of peculiarities, diversities infinitely greater than those existing between the highest and lowest races of mankind. Then, again, the highest and lowest human races interbreed, and their offspring is fertile, which would hardly be the case if the parents were of different species. Some have held that the difficulties of migration from an original center of creation were too great to be compatible with the wide geographical distribution of mankind. Yet even the South Sea islanders—and in their case the difficulties alluded to must have been greater than in most others—may have come to their present abodes by migration; for Japanese mariners have sometimes by stress of weather been driven from their course, and cast on the shores of islands in the South Seas. This doctrine of monogeny, or original unity of the human race, is supported by Dr. Latham with arguments drawn from philology. Dr. Latham, taking it as a matter of fact that all the languages of mankind have had a common origin, argues from it in favor of an original unity of race. This common origin of languages, however, is a thing by no means proved. "The idea of an original language of the whole human race," says Dr. Waitz (*Introduct. Anthropologie Naturvölker*), "is by science now regarded as a chimera." Admitting that Klaproth, Fürst, and Delitzsch have taken great pains to establish an affinity between the Sanscrit and the Hebrew, M. Renan and other excellent authorities regard the attempt as unsuccessful, and, even were it otherwise, "the Chinese," says a late writer (Farrar, *Essay on the Origin of Language*), "must always remain a stumbling-block in the way of all theories respecting a primitive language. Radical as is the dissimilarity between Aryan and Semitic languages, and wide as is the abyss between their grammatical systems, yet they almost appear like sisters when compared with the Chinese, which has nothing like the organic principle of grammar at all. Indeed, so wide is the difference between Chinese and Sanscrit, that the richness of human intelligence in the formation of language receives no more striking illustration than the fact, that these languages have absolutely *nothing* in common except the end at which they aim. This end is in both cases the expression of thought, and it is attained as well in Chinese as in the grammatical languages, although the means are wholly different."

Having thus made the reader in some degree acquainted with the views of Drs. Prichard and Latham on the subject of E., we now proceed to inform him of the totally different views and conclusions of the American school of ethnology. This school was founded by the late Dr. Morton of Philadelphia, an erudite and active man of science, who labored for many years in forming a collection of human crania of all nations, and of ancient as well as modern ages, with the design of still further carrying out Blumenbach's researches into the varieties of mankind by a comparison of crania, according to the method he had proposed. This collection of crania was begun in 1830, and at the time of Morton's death in 1851, amounted to the large number of 918 human crania, to which were afterwards added 51; and it, besides, included 278 crania of mammals, 271 of birds, and 88 of reptiles—in all 1606 skulls, being the largest collection of the kind ever formed, and which, fortunately for the purposes of science, is now deposited in the museum of the academy of natural sciences at Philadelphia. Simultaneously with this accumulation of crania, Dr. Morton carried on his researches in E., not, however, in the restricted sense in which he began, following Blumenbach's classification, but availing himself of the latest discoveries of Prichard, and the other English and continental writers. One of the results of his labors was the publication, in 1839, of a handsome work, entitled *Crania Americana*, which was followed in 1844 by the *Crania Ægyptiaca*, in the collection of which he had been much aided by Mr. G. R. Gliddon. "In this work," says his biographer, Dr. Patterson, "Morton found himself compelled to differ in opinion from the majority of scholars, in regard to certain points of primary importance." The great question of the unity or diversity of mankind in their origin was one that early forced itself upon his attention, and the conclusion at which he arrived, after much patient investigation, was in favor of the latter view. He was slow to publish any opinion on the subject, probably reserving it for a work upon which he was engaged, to be entitled the *Elements of Ethnology*. His opinion, however, was well known to his friends. In a note to a paper in *Silliman's Journal* for 1847, he says: "I may here observe that whenever I have ventured an opinion on this question, it has been in favor of the doctrine of primeval diversities among men; an original adaptation of the several races to those varied circumstances of climate and locality which, while congenial to the one, are destructive to the other; and subsequent investigations have confirmed me in these views." In a latter to Dr. Nott, dated Jan., 1850, he lays down the following proposition: "That our species had its origin, not in one, but in several or in many creations, and that these diverging from their primitive centers, met and amalgamated in the progress of time, and have thus given rise to those intermediate links of organization which now connect the extremes together. Here is the truth divested of mystery; a system that explains the otherwise unintelligible phenomena so remarkably stamped on the races of men." His latest utterance upon the subject is contained in a letter written to Mr. G. R. Gliddon, in April, 1851, only a fortnight before the writer's

decease, which concludes as follows: "The doctrine of the original diversity of mankind unfolds itself to me more and more with the distinctness of revelation." His views upon this and other points of dispute among ethnologists have been since embodied in a remarkable work, entitled *Types of Mankind; or, Ethnological Researches based upon the Ancient Monuments, Paintings, Sculptures, and Crania of Races, and upon their Natural, Geographical, Philological, and Biblical History: illustrated by selections from the inedited papers of S. G. Morton, M.D., and by additional contributions from Prof. L. Agassiz, W. Usher, M.D., and Prof. H. S. Patterson.* By J. C. Nott, M.D., and G. R. Gliddon (Philadelphia, 1854). In this composite work, perhaps the most remarkable feature is the paper contributed by the celebrated naturalist, Prof. Agassiz, in support of Dr. Morton's theory as to the original diversity of the human races.

The paper by Agassiz is entitled, *Sketch of the Natural Provinces of the Animal World, and their Relation to the Different Types of Man.* It was drawn up by the writer from a conviction that much might be gained in the study of ethnography by observing the natural relations between the different races of man and the plants and animals inhabiting the same regions. The sketch given by him is intended to show, that "the boundaries within which the different natural combinations of animals are known to be circumscribed upon the surface of our earth coincide with the natural range of distinct types of man. Such natural combinations of animals circumscribed within definite boundaries are called *Faunæ*, whatever be their home—land, sea, or water." There are eight regions of the earth, according to Agassiz, each containing its own faunæ, and its own peculiar type of man; and his main conclusion from a consideration of these several faunæ is as follows: "That the diversity among animals is a fact determined by the will of the Creator, and their geographical distribution part of the general plan which unites all organized beings into one great organic conception; whence it follows that what are called human races, down to their specialization as nations, are distinct primordial forms of the type of man." Messrs. Nott and Gliddon, in their work quoted, appeal triumphantly to this theory of Agassiz in support of their view as to the primitive diversity of the races of mankind; and in a subsequent work, *Indigenous Races of the Earth* (Philadelphia, 1857), have inserted a further communication from the writer, in which, while he reiterates his formerly expressed opinion, that the races of man, so far as concerns their geographical distribution, are subject to the same circumscription as the other members of the animal kingdom, he observes: "Even if this fact stood isolated, it would show how intimately the plan of the animal creation is linked with that of mankind. But this is not all. There are other features, occurring among animals, which require the most careful consideration, inasmuch as they bear precisely upon the question at issue, whether mankind originated from one stock or from several stocks, or by nations. These features, well known to every zoologist, have led to as conflicting views respecting the unity or plurality of certain types of animals as are prevailing respecting the unity or plurality of the origin of the human races. The controversy which has been carried on among zoologists upon this point, shows that the difficulties respecting the races of men are not peculiar to the question of man, but involve the investigation of the whole animal kingdom—though, strange as it may appear, they have always been considered without the least reference to one another."

This theory of Agassiz, it must be stated, is very generally controverted, as likewise the opinions generally of Dr. Morton and the American school of E., partly on biblical, but chiefly on scientific grounds. Indeed, from the conflict of opinions as to the origin of the human race, if the solution of this question were the sole object of anthropology, the science might be said to be in a very unsatisfactory state. But this is not the case. The question at issue is one that may well be left in abeyance for the present. Without it, the field of inquiry is sufficiently wide, and is well cultivated by skilled laborers, who continually bring the product of their researches in physiology, geography, archæology, and comparative philology to enrich and fructify the newly turned-up soil.

Subjoined is a tabular view of the different races of mankind, according to the useful, if not absolutely perfect classification of Dr. Latham:

I. MONGOLIDÆ.

Physical Characteristics.—Face broad and flat; frontal profile retiring or depressed; maxillary profile moderately prognathic or projecting, rarely orthognatic; eyes often oblique; skin rarely a true white, rarely a jet-black; irides generally dark; hair straight, and lank, and black, rarely light-colored, sometimes curly, rarely woolly. *Languages*—aptotic and agglutinate, rarely with a true amalgamate inflection. See LANGUAGE. *Distribution*—Asia, Polynesia, America. *Influence upon the history of the world,* material rather than moral.

A. ALTAIC MONGOLIDÆ.—1. *Seriform stock,* embracing Chinese, Thibetans, Anamese, Siamese, Kambojians, Burmese, the Môn, and numerous unplaced tribes. 2. *Turanian stock,* embracing the Mongolian branch, the Tungusian branch, the Turk branch, and the Ugrian branch.

B. DIOSCURIAN MONGOLIDÆ.—1. Georgians. 2. Lesgians. 3. Mizjeji. 4. Irôn. 5. Circassians.

C. OCEANIC MONGOLIDÆ.—1. *Amphinesian stock,* embracing Protonesians, Polyne-

sians, Malegasi (?). 2. *Kelænonesian stock*, embracing the natives of New Guinea, New Ireland, Solomon's Isles, Louisade, New Caledonia, Australia, and Tasmania.

D. HYPERBOREAN MONGOLIDÆ.—1. Samöeids. 2. Yeniseians. 3. Yukahiri.

E. PENINSULA MONGOLIDÆ.—1. Koreans. 2. Japanese. 3. The Aino. 4. Koriaks. 5. Kamskadales.

F. AMERICAN MONGOLIDÆ.—Embracing the various native tribes of North and South America.

G. INDIAN MONGOLIDÆ.—1. Tamul. 2. Pulinda. 3. Brahui. 4. Indo-Gangetic. 5. Purbutti. 6. Cashmirian. 7. Cingalese. 8. Maldivian.

II. ATLANTIDÆ.

Physical Characteristics.—Maxillary profile projecting; nasal, generally flat; frontal, retiring; cranium, dolichocephalic; the parietal diameter being generally narrow; eyes rarely oblique; skin often jet-black, very rarely approaching a pure white; hair crisp, woolly, rarely straight, still more rarely light-colored. *Languages*, with an agglutinate, rarely an amalgamate inflection. *Distribution*, Africa. *Influence on the history of the world*, inconsiderable.

A. NEGRO ATLANTIDÆ.—Embracing various negro tribes.

B. KAFFRE ATLANTIDÆ.—Kaffre tribes, etc.

C. HOTTENTOT ATLANTIDÆ.—1. Hottentots. 2. Saabs. 3. Dammaras.

D. NILOTIC ATLANTIDÆ.—1. Gallas. 2. Agows and Falasha. 3. Nubians. 4. Bishari. 5. M'Kuafi, etc.

E. AMAZIRGH ATLANTIDÆ.

F. EGYPTIAN ATLANTIDÆ.

G. SEMITIC ATLANTIDÆ.—1. Syrians. 2. Assyrians. 3. Babylonians. 4. Beni Terah (Edomites, Jews, Samaritans, etc.). 5. Arabs. 6. Ethiopians. 7. Canaanites, etc.

III. JAPETIDÆ.

Physical Characteristics.—Maxillary profile but little projecting; nasal often prominent; frontal sometimes nearly vertical; face rarely very flat, moderately broad; skull generally dolichocephalic; eyes rarely oblique; skin white or brunette; hair never woolly, often light-colored; irides black, blue, gray. *Languages*, with amalgamate inflections, or else anaptotic; rarely agglutinate, never aptotic. *Distribution*, Europe. *Influence on the history of the world*, greater than that of either the Mongolidæ or the Atlantidæ, moral as well as material.

A. OCCIDENTAL JAPETIDÆ.—Kelts.

B. INDO-GERMANIC JAPETIDÆ.—1. *European class*, embracing Goths, Teutons (Mœso-Goths, High and Low Germans, Franks), Scandinavians, Sarmatians, Slavonians (Russians, Servians, Illyrians, Bohemians, Poles, Serbs), Mediterranean Indo-Germans (Hellenic branch, Italian branch). 2. *Iranian class*, embracing Persians, Kurds, Beluchi, Patans (Afghans), Tajiks, Siaposh, Lugmani, Dardoh, Wokhan. 3. *Unplaced stocks*, Armenians, Iberians, Albanians. 4. *Extinct stocks*, Pelasgi, Etruscans, populations of Asia Minor.

ETHYL (symbol, C_4H_5) is the starting-point of the family group, of which ordinary ether and alcohol are members.

Ethyl,	C_4H_5.
Ether,	C_4H_5O, oxide of ethyl.
Alcohol,	C_4H_5O,HO, hydrated oxide of ethyl.

It may be prepared by acting upon iodide of ethyl by granulated zinc, when the ethyl is liberated, and may be obtained as a colorless, inflammable gas, of an agreeable odor, insoluble in water, but soluble in alcohol.

ETHYLAMINE is a substance strongly resembling ordinary ammonia or hartshorn in odor and other properties. It is found in coal-tar, in the oil obtained during the destructive distillation of bones, in the gases evolved during putrefaction, and may be produced by certain complicated chemical processes. E. is a mobile liquid of specific gravity 696 (water = 1000), and boils at 66° F. It has a strong ammoniacal odor, has an alkaline action with coloring matters, forms white fumes with strong acids, and in composition is analogous to gaseous ammonia (NH_3 or NHHH), with one of the atoms of hydrogen replaced by ethyl (C_4H_5O or Ae), and is represented by the symbol NHHAe or NH_2Ae.

ETHYLENE, ETHENE, or BICARBURETED HYDROGEN. See OLEFIANT GAS, *ante*.

ETIENNE, ST., an important manufacturing t. of France, in the department of Loire, is situated on both banks of the Furens, an affluent of the Loire, in the center of a valuable and extensive coal-field, 30 m. s.s.w. of Lyons by rail, and about 288 m. s.s.e. of Paris. It is surrounded by coal-mines, is seated upon coal-deposits, and has galleries driven even beneath its streets. The stream on which the town is built furnishes invaluable water-power to move its machinery, and its waters are also of great use for tempering iron and steel. The old town of St. E. is badly built, and the new town, which has sprung up very quickly, is destitute of architectural harmony. The newer

houses are built of a fine white sandstone, and are frequently five and six stories in height; but they rapidly become tarnished and begrimed by the perpetual cloud of coal-smoke which hangs over the town. The most noteworthy building is the Hôtel-de-Ville, which contains the *Musée Industriel*, with specimens of the manufactures of the town, and of the minerals and fossils of the neighborhood. St. E. is famous for its manufactures of ribbons and firearms. The ribbon-manufactories contain 30,000 looms, and the annual value of their produce is estimated at 60,000,000 francs (£2,375,000) in value. They are unrivaled in elegance of design, and in richness and delicacy of color, and are exported to all parts of the world. There are extensive private manufactories of firearms, besides an imperial firearms manufactory, which supplies most of the muskets of the French army. St. E. has also extensive manufactures of bayonets, scythes, nails, saw-blades, foils, anvils, vices, files, and also of silks, velvets, lace, embroidery, muslins, glass, leather, and paper. From the coal-field on which St. E. is situated, about 600,000 tons of coal are raised annually. On the 1st Jan., 1856, St. E. was constituted the capital of the department, in place of the town of Montbrison. St. E. arose originally from a castle built in the 10th c. by the counts of Forez. It increased greatly in the 15th c., and in 1771 it had 20,000 inhabitants; in 1851, it had 49,614 inhabitants; in 1872, it had 80,526; and in 1876, 117,537 inhabitants.

ETIQUETTE' (Fr. a ticket, supposed to be from the Celtic *tocyn*, a little piece or slip —a token). Originally, E. signified a little piece of paper affixed to a bag or other object to signify its contents. The word came probably to possess the secondary meaning which we now attack to it, of the forms or decorums observed in the intercourse of life, more particularly on state occasions, from its having been customary to deliver such tickets, instructing each person who was to take part in the ceremony as to the part which he was expected to play. The cards which are still delivered to the mourners at funerals, and those on which the order of the dances is set forth at balls and evening parties, are of this nature. Popular publications are constantly issuing from the press for the purpose of teaching E., or the rules of behavior in good society. They will, for the most part, be found far less trustworthy than the promptings of nature, where the individual possesses a reasonable amount of reverence for others, and respect for himself. Yet there are certain conventionalities which can only be learned by instruction of some kind, or by observation, and the observation may be attended with unpleasant circumstances.

ET'IVE, a sea-loch in the n. of Argyleshire, running inland from the firth of Lorn, 20 m. e. and n.e., with a breadth of a quarter to three miles. It is bordered by granite in its upper part, and by trap in its lower. Near its mouth, there is mica-slate on the n. side, and permian strata on the south. The river Awe, the outlet of loch Awe, falls into the loch at the bend, where also is the ferry of Bunawe, and the small river Etive falls into it at its n.e. end. The loch abounds in seals, salmon, porpoises, and cod. The scenery around the upper half of the loch is grand and romantic. To the e. rise Ben Cruachan, 3,670 ft., and Ben Starive, 2,500 ft., and to the n. Ben Mahrgage. The loch admits small coasting-vessels. Ardchattan priory, founded in the 13th c., on the site of a monastery of the 6th or 7th c., is now in ruins. Connel ferry, in the lower part of the loch, and near a vitrified fort, is only 680 ft. broad, and is a very turbulent cataract, 3 or 4 ft. high at half-tide, caused by a sunken reef of rocks, partly bare at low water. At the s. side of the mouth of loch E., 3 m. n. of Oban, on a projecting conglomerate rock 10 to 30 ft. high, are the ruins of Dunstaffnage castle, the ancient stronghold of the Macdougals, a building in what is called the Edwardian style of the end of the 13th or beginning of the 14th c., with walls 400 ft. in circumference, 30 to 50 ft. high, and 10 ft. thick, and with three round towers. Dunstaffnage is supposed by some to have been the seat of the Dalriadic Scottish monarchy (see DALRIADA), and from this place the famous slab or stone of destiny (Lia Fail), now in the coronation-chair, Westminster abbey, is said to have been taken in 843 by Kenneth Macalpine to Scone, whence Edward I. removed it to London.

ET'NA, or ÆTNA (now MONTE GIBELLO), is the largest volcano in Europe. It is an isolated mountain, situated on the eastern coast of Sicily, and cut off from the chain of mountains which run parallel with the northern shore of the island, by a small valley, through which flows the Alcantara, and from the southern chain by a larger valley, which forms the basin of the Giaretta. Its eastern side rises directly from the Mediterranean, 30 m. of coast being formed by the streams of its lavas. Its base is almost 90 m. in circumference, and from this it rises like an immense cone to the height of 10,874 feet.

The history of E. does not carry us far back geologically; an active volcano in the later portion of the tertiary period, it continues still to pour forth materials; and the ejected ashes, dust, and lapilli, together with the streams of molten lava, have, in the course of untold ages, built up this immense mountain. One central crater has been the prevailing outlet for these materials, and they have consequently arranged themselves into one central and dominant mound—the cone-shaped E.; but innumerable secondary and surrounding craters, each forming, by its ejected matter, an external smaller cone, exist on Etna. Many of these, in the progress of the growth of the mountain, have been covered and hid by the more recent eruptions. Eighty of them may be

counted surrounding the upper portion of E., many being hills of considerable altitude, but all of them appearing only as trifling irregularities when viewed at a distance as subordinate points of so imposing and colossal a mountain. Seen from the summit, they present a beautiful aspect; some bare and barren, others covered with the dark and somber pine, or with the gayer and more varied foliage of the oak, the beech, and the hawthorn, and all arranged in picturesque groups of various heights and sizes. But the most remarkable feature in E. is the Val del Bove, an immense gully excavating the eastern flank of the mountain, 5 m. across, and surrounded by nearly vertical precipices from 1000 to 5,000 ft. high, on which are shown sections of innumerable lava-streams and beds of scoriæ, traversed by highly inclined dikes. It has a singularly dreary and blasted appearance.

The summit of E. rises considerably above the line of vegetation, and consequently presents, except where covered with snow, a dreary waste of black lava, scoriæ, and ashes, in the center of which, in a desolate plain, rises the crater-bearing cone. This is called the desert region. It is followed by 6 or 7 m. of the woody region, in which luxuriant forests of pine, oak, beech, poplar, and hawthorn abound, together with rich pasturage for herds and flocks. A varying breadth of from 2 to 11 m. of cultivated region surrounds the base of Etna. Its great products are corn, oil, wine, fruit, and aromatic herbs.

The first recorded eruption of E. took place 476 B.C. The most remarkable that have occurred since are the following: 1169 A.D., when Catania and 15,000 of its inhabitants were destroyed; 1527, in which two villages and many human beings perished; the eruption which continued at intervals from 1664 to 1673, and destroyed many villages with their inhabitants. Numerous chasms were formed at this time; from one several miles long and 4 or 5 ft. wide were emitted a bright light and strong sulphurous vapor; from another, black smoke and quantities of stones were given out; and from others, streams of lava. In 1673, an immense volume of salt (?) water rushed down the mountain: by some, it is supposed to have been ejected from the crater, but it is more probable that it arose from the sudden melting of the snows which covered the summit of the mountain. A very great eruption took place in 1852. Immense clouds of ash-gray dust were ejected. From two new mouths on the eastern flank there issued vast torrents of lava, one of which was 2 m. broad, and at one time as much as 170 ft. deep. The next outbreak, in 1864–65, was of trifling importance. That of May, 1879, was much more violent; the clouds of smoke and showers of ashes and scoriæ being followed by the ejection of a torrent of lava from 200 to 300 ft. in width, which desolated a large tract of highly cultivated land.

The minerals peculiar to volcanic rocks occur at E., such as chrysolite, zeolite, selenite, alum, niter, vitriol, copper, mercury, and spicular iron.

ETOLIA. See ÆTOLIA.

E'TON, a t. in the s. of Buckinghamshire, on the left bank of the Thames, 42 m. S.S.E. of Buckingham, and 22 m. W.S.W. of London, near the Slough station of the Great Western railway. It lies opposite to Windsor, in Berkshire, with which it is connected by a bridge over the Thames. Though in separate counties, these two towns really form one. E. chiefly consists of one long well-paved street, and is mainly dependent on the college. Pop. '71, 2,806, exclusive of the Eton boys.

ETON COLLEGE is one among the most famous educational establishments in England. It was founded in 1440 by Henry VI., under the title of "The College of the Blessed Mary of Eton beside Windsor." The original foundation consisted of a provost, 10 priests, 4 clerks, 6 choristers, 25 poor grammar-scholars, a master, and 25 poor infirm men. The king provided for the establishment out of his own demesne lands and the estates of certain alien priories. A supplementary charter was granted in 1441, in which year also the college buildings were commenced. Henry was very solicitous that the work should be of a durable kind. Some of the buildings were finished in 1443, and were handed over by the royal commissioners to the provost, clerk, and scholars. Political troubles of various kinds retarded the completion of the buildings till 1523. Bishop Waynfleete was the first head-master, and afterwards a munificent supporter of the college. The institution passed through much peril in the reign of Edward IV., and again in the time of the commonwealth; but it surmounted the dangers, and the increasing value of its estates brought in a large income.

The original foundation has been greatly modified under the public schools act, 1868. It now consists of a provost and 10 fellows, who constitute the "governing body," 2 chaplains or conducts, and 70 scholars. The members of the governing body are nominated by the universities of Oxford and Cambridge, and other learned and responsible electors. Several valuable scholarships at King's college, Cambridge, are filled up every year from among the scholars by competitive examination. There are also other scholarships and prizes open to all the members of the school, such as the Newcastle and Tomline scholarships, and prizes for modern languages, founded by the late prince consort. The scholars are lodged within the college walls.

The main portion of the establishment, however, numbering nearly 900, consists of the *oppidans*, students who live out of the college, and whose friends pay liberally for their education. The tuition is the same for them as for the *collegers* or scholars.

There are an upper and a lower school, managed by the head master and lower master, with a large staff of assistants. Considerable discussion has taken place within the last few years concerning the kind of education received at Eton, the cost at which it is obtained, and the enormous incomes derived by some of the officials. The course of education is still somewhat of the mediæval character, which regards Greek and Latin as the basis of all good education; but mathematics and natural science, under recent regulations of the governing body, receive a large share of attention. There is great prestige connected with the college.

The chief buildings of the college consist of the chapel, the hall, the library, the schools, the provost's and master's apartments, and the lodgings of the fellows, surrounding two quadrangles; together with the boys' library and sleeping apartments, in a cluster called the new buildings, attached to the northern side of the older group. The chapel is mostly of stone, the other buildings of brick; and the effect of the whole is very picturesque, as seen from the terrace of Windsor castle, on the other side of the Thames. The chapel is an especially beautiful object. The houses of the masters are generally fitted up for the reception of oppidans as boarders.

ET'OWAH, co. in n.e. Alabama, crossed by the Coosa river, and the Alabama and Chattanooga railroad; 650 sq.m.; pop. '70, 10,109—1708 colored. The surface is rough, with extensive forests, and fertile soil. Productions, corn, cotton, wheat, etc. Co. seat, Gadsden.

ETRU'RIA, TYRRHE'NIA, TU'SCIA, designated, at a period anterior to the foundation of Rome, nearly the whole of Italy, together with some of its most important western islands. Its northern part, from the Alps to the Apennines, was known under the name of Etruria Circumpadana; its southern, from the Tiber down to the gulf of Pæstum, or, according to some, to the Sicilian sea, under that of Etruria Campaniana; while the central portion, bounded on the n. by the Apennines and the river Macra, s. and e. by the Tiber, and w. by the Tyrrhenian sea, was called Etruria propria. The two first, however, did not long remain Etruscan territory, but were either reconquered by the surrounding tribes to whom they had originally belonged, or fell into the hands of new immigrants. No historical records of that brief period of any moment having yet come to light, they do not claim our attention; while Etruria proper, scanty though our information about it still be, deserves our interest in the highest degree. For its physical features, we refer the reader to Tuscany, Lucca, and the Transtiberine portion of the present papal dominions; and have only to remark, that vast expanses of that country, which now are either covered with deep forest, or are shunned on account of the malaria, were in those times fruitful, densely peopled regions. For political, or rather administrative purposes, Etruria proper was divided into twelve sovereign cities, or rather cantons, among which the most important were Tarquinii (Corneto), the cradle of the royal family of the Tarquins, who at one time wielded the scepter of Rome; Cære (Agylla, Cervetri), which, during the war of Rome with the Gauls, offered a refuge to the Roman Flamen Quirinalis and vestal virgins; Veii, the greatest and most powerful city of Etruria, with 100,000 inhabitants, which carried on seven wars with Rome; Clusium (Kamars, Chiusi), the chief of which, Porsena, as principal commander of the Etruscan troops, dictated a humiliating peace to Rome after she had expelled the Tarquins; Perusia (Perugia), destroyed in the Perusian civil war (40); Arretium (Arezzo), birthplace of Mæcenas. Of other not sovereign places may be mentioned Luca (Lucca), Pisæ (Pisa), on the Arnus, with the Portus Pisanus, now Leghorn, and Florentia (Firenze, Florence), on the Arnus.

To what nation the inhabitants—called Etruscans (=Exteri, strangers) or Tuscans in the Roman, Tyrrheni or Tyrseni (*Turrēnoi, Tursēnoi*) in the Greek, and Rasena (Tesne Rasne) in their own language—originally belonged, and what country they came from, is a question which was debated many hundred years before Christ, and is not settled yet. All the most ancient writers, save one of the most trustworthy, Dionysius of Halicarnassus, implicitly follow Herodotus, who—confounding them, perhaps, as is his wont, with the Lydian *Turrēnoi*, or inhabitants of the city of Tyrrha—pronounces them to be Lydians, although there is not the slightest similarity between these two nations, and although Xanthus, the Lydian historian, knows nothing whatever about a fabled famine of eighteen years' duration in Lydia, followed by an immigration to Italy under a prince Tyrrhenus. Dionysius himself offers no opinion; he calls them an indigenous race—which means nothing; and it is surprising that some modern investigators should, despairing of a rational solution of the old riddle, have fallen back upon this evasive theory of "autochthons." Thucydides, in first mixing up the Torrhebian pirates with the Pelasgian filibusters, gave rise to the most hopeless confusion about their very name. As to the innumerable theories and hypotheses that have been put forward since his day, we will only mention that while Ciampi and Collar hold them to be of Slavonic origin, Fréret calls them Celts; Micali, Albanese; Lami, Pfitzmaier, and Stickel, Semitics; and others variously make them Goths, Scandinavians, Basques, Assyrians, Phenicians, Egyptians, and Armenians. The most rational and generally accepted opinion is that of Niebuhr—modified more or less by Ottfried Müller, Lanzi, Lepsius, Steub—of their being, when they first appear in history, a mixture of an eastern tribe, which had settled for a while in the Rhætian Alps (the Tyrol of to-day), and Pelasgians, whom

they found in their new Italian seats; these latter having, in their turn, since their immigration, mixed with the Umbrians, the oldest historical inhabitants of those parts. But, as we said before, this is only the most rational opinion that rose out of an ocean of wild speculation: so far from any authentic proofs having been brought forward in its support, the question stands to-day precisely where it stood when Dionysius wrote:—"The Etruscans do not resemble any people in language and manners."

Immense as was their influence on Roman, and, in fact, on European civilization, very little is known with respect to their political history. Chiefly cultivating the arts of peace, they still seem, long after their heroic period, to have been powerful enough to scare away any invader, and this probably is the reason why historians have so little to record of them; but their decline may be said to stand in an inverted ratio to the rise of Rome. The 7th and earlier half of the 6th c. B.C. had been the most powerful and flourishing epoch of the Etruscan state in its widest sense—which then probably had been in existence for four or five hundred years. Whether they had put their Tarquinii as governors over conquered Rome, or whether, on the contrary, the reign of this Etruscan family would denote the subjugation of Southern Etruria by Rome herself, is not quite clear; but the expulsion of the last Roman king, Tarquinius (Tarchon), called Superbus, was followed, about 507 B.C., by a war between the Etruscans, under Porsena of Clusium, and the Romans, which, although ending in a most ignominious peace, dictated within the walls of Rome, did not bring about the restoration of the Tarquinian dynasty. From the wars between Veii and Rome, which began in 486, and ended—interrupted only by an occasional armistice—395 B.C., with the destruction of Veii, dates the gradual but sure extinction of Etruria as an independent state. The Gauls advancing from the north, the Etruscans were forced to conclude a forty years' truce with their adversaries at any price; but these over, and the Romans being engaged with the Samnites, the Etruscans recommenced the hostilities more fiercely than ever. In the course of this last war, the Romans succeeded, 309 B.C., under Q. Fabius Maximus, in twice defeating them, and Fabius crossed the Ciminian forest—the frontier sacred from time immemorial; and when, 283 B.C., P. Cornelius Dolabella had beaten both them and their Gallic auxiliaries in a decisive and sanguinary battle at the Vadimonian lake, Etruria became a Roman province; and about two hundred years later, the Lex Julia conferred upon her inhabitants, as a reward for their fidelity, the right of citizenship. Up to that time, they had succeeded in keeping up their own singularly distinct creed, customs, traditions, language—their nationality, in fact; when Sulla, 82 B.C., infuriated by the part they had taken against him, liberally bestowed great portions of their land upon his veterans; and some fifty years later, Octavianus planted his military colonies there. This wrought and completed the transformation of that mysterious conglomeration of heterogeneous races and tribes, hitherto called Etrurians, into Romans. Once more, well-nigh 2,000 years after its extinction, the kingdom of Etruria (Hetruria) rose before the eyes of the world. The peace of Luneville re-created it, and conferred it on the hereditary prince, Louis of Parma; after whose death, his widow, the infanta Louisa of Spain, administered the government for their son, Charles Louis, up to 1807, when it became a French province. From 1809, it again bore the name of the Grand Duchy of Tuscany; and to TUSCANY—which in our days forms a province of the Italian kingdom, as it did of yore—and to ITALY, we refer for its modern history.

We have spoken above of twelve cities as forming the confederacy of Etruria proper. Similar confederacies of twelve cities were established, independently of each other, in the two other Etrurias. The cities themselves, however, cannot be fixed now in all cases. From the fact of more than twelve autonomous ones being recorded in Etruria proper, it would appear that some among these twelve confederates, or *populi*, possessed more than one capital city, each populus, however, being limited to one representative vote in the general council. The members of the confederacy were bound to appear regularly at an annual religious assembly near the temple of Voltumna, a locality which we are as yet unable to point out. Here great fairs were held for the people; common operations of war being discussed by the *principes*, and a general-in-chief for the ensuing year elected from their number. Each city or canton, in the earlier times at least, had a king (Lucumo, Lauchme=Inspired), chosen for life, who at the same time acted as high-priest; and a hereditary nobility, which alone was eligible to the higher offices of state. Next to them, in the political and social scale, came the people, properly so called—free, not subject personally to the nobility; lowest stood a great number of clients or bondmen, probably the descendants of subjected original inhabitants. On the whole, the federal interdependence between the cities was far from close. Single cities carried on wars in which the others took no part; and when the confederacy resolved on general action, there were always some members which, for some reason or other, stood aloof. It appears from this that the Etruscan constitution was analogous to the Greek and Roman in their earliest stages: the community develops itself into a *polis* or city, chooses a head, or rather high-priest, and enters into a more or less intimate alliance with its neighboring cities; but, beside that king of its own, recognizes a common chief only in time of war.

The Etruscans were, as a people, less warlike than any of their neighbors, especially the Romans, and conspicuous is their want of anything like cavalry. Theirs was also the un-Italic custom of hiring soldiers, and their energies seem principally to have been

directed to the more profitable occupations of trade and agriculture. One of the chief articles of their commerce was amber, which Germans brought from the Baltic to Etruria Circumpadana, whence it was conveyed to Greece by sea. In the western parts of the Mediterranean, they were formidable as pirates; while they were welcomed by the Carthaginians and the Greeks of Magna Græcia, as importers of indigenous products of nature and art, which they exchanged for the wealth of the east and south. That their commerce within Italy must have been very extensive, appears from the fact, that all the states of central Italy adopted their system of coinage, based, like their tables of weights and measures, and many of their political institutions, on the duodecimal system.

The striking contrast between the Etruscans and their Italic and Greek neighbors, which appears in the short thickset frames, the large heads and bulky extremities of the former, and the slender limbs and graceful harmony in the whole structure of the latter, and which runs with equal distinctness through the intellectual lives of the three nations, manifests itself nowhere with greater power than in their religions. Equally distant from the abstract, clear rationalism of the Latins, and the plastic joyfulness of Hellenic image-worship, the Etruscans were, as far as their dumb fragments show—for what we find on them of human words we do not understand—chained in a dark and dotard mysticism, such as a blending of a half-forgotten eastern symbol-service with barbarous religious practices of northern savages, grafted upon archaic Greek notions, might produce. In their pantheon, the predominance belongs to the evil, mischievous gods; their prisoners are welcome sacrifices to the heavenly powers; they have no silent depths where the "good spirits" of their departed dwell, but a hell of the most hideous description, and a heaven where permanent intoxication is the bliss that awaits the virtuous. They divide their gods into two classes, and they place them in the most northern, and therefore most immovable point of the world, whence they can best overlook it. The upper section is formed by shrouded, hidden gods (Involuti), of uncertain number, who act awfully and mysteriously, and twelve lower gods of both sexes, called Consentes, Complices. Tinia (Zeus, Jupiter) is the chief of these latter, and stands between the two divisions of the gods, receiving orders for destruction from the upper ones, while the lower ones form his ordinary council, and obey his behests. Nine of these (Novensiles) hurl lightnings at various times and with peculiar effects. The three of these deities which seem to have been the principal objects of worship were Tinia himself, armed with three different kinds of lightning, Cupra (Hera or Juno) and Menrfa (Minerva, Pallas Athene). Gods most peculiarly Etruscan are Vejovis, an evil Jupiter, whose thunder-bolts have the power to deafen, and Nortia, the goddess of fate, also called Lasa Mean. Besides these, they put a host of demons over the different portions of the creation:—the heavens, the earth, and the lower regions (Penates, Lares, and Manes). Their deities have generally wings; and before the Assyrian bulls had come to light, some antiquaries established from this a connection with the Hebrew winged cherubim. Characteristic in the highest degree is their "disciplina" or art of "divination." This had been revealed by Tages, a grandson of Jupiter, who was dug out near Tarquinii, in the shape of a child-like dwarf with gray hair—a most striking caricature of these both childish and senile practices—and who died immediately after having communicated these mysteries. They were at first the property of the noble families; but in the course of time, as others were initiated, and schools for priests were founded, these mystical and awe-striking teachings came to be written down. It is saddening to observe here again in what monstrous insanities the spirit of man occasionally revels, and that, too, in the province of what is noblest and highest—religion. The "disciplina" was developed into an exact science, fully as minutely and casuistically sharpening its points and splitting its hairs as Hindu or Mohammedan theology would. It taught what gods hurled the different kinds of lightning; how, by the color and the peculiar quarter of the sky, the author of the bolt might be recognized; whether the evil denoted was a lasting or a passing one; whether the decree was irrevocable or could be postponed; how the lightning was to be coaxed down, and how it was to be buried. This was the specialty of the Fulgurales. The Haruspices had as their share the explanation of portents, prodigies, monsters, the flight and cries of birds, the entrails of sacrificial animals; while others ministered in the holy rites at the foundation of cities, the building of gates, houses, etc. Their ceremonies (a word derived from their town Cære) were endless and silly, but the show and pomp with which their priests knew how to surround these jugglerics, and from which the Romans largely borrowed, made them acceptable in the eyes of the herd; and although Rome herself, with all her augurs, called Etruria "the mother of superstition," there was a certain odor of tithes and fees about these rites which made many anxious to "preserve religion in its primeval purity."

In the entire absence of anything like a genuine Etruscan account, even the outlines of the relation between their religion and that of the Greeks on the one hand, and the Romans on the other, are exceedingly difficult to trace; so much, however, is certain, that they adopted and assimilated many points of archaic Greek theology, and clothed them in a garb of their own, and that this process was gone through and repeated still more completely by the Romans, in their turn, with respect to the religious notions of

the Etruscans. The articles on Greek and Roman religion will furnish further information on this point.

The high degree of civilization which the Etruscans possessed long before Rome was heard of, is testified by innumerable works of masonry and art. The Etruscans were of an eminently practical turn of mind, and domestic, like the north. Trusting to their priests for reconciliation with the gods, who always seemed irate, but whose angry decrees could easily be foreseen and averted, they set to work in developing the inner resources of the country, and in making the best use of their intercourse with foreign countries. They thus became eminent in agriculture, navigation, military tactics, medicine, astronomy, and the like; and in all these, as well as in some of the very minutiæ of their dress and furniture, the Romans became their ready disciples and imitators. The division of the year into 12 months, of the months into kalends and nones and ides, the designation of the numerals, were Etruscan; from the same source were derived the *toga prætexta* as well as the pomp of triumphs, the *lictors* and *apparitors*, down to the ivory curule chairs. The towns of the Etruscans were clean and healthy, owing to their perfect system of drainage and sewerage; they tunneled and excavated, they embanked and irrigated, they turned swamps into cities, changed the course of streams, and excelled in all kinds of useful public and private works. Their ideal was not the beautiful or the spiritual, but a comfortable, and, if possible, luxurious existence. As a special proof of their love for their own hearth, a quality probably imported from the north, we might adduce their invention of the atrium, the common sitting-room of the family, where the master of the house sat surrounded by his penates and the figures of his ancestors, while the wife and her handmaidens plied the labors of the loom or the distaff. As in the Germanic nations, woman stood in high estimation. She was the companion, not the slave of the husband, and thus had certainly not a little share in the softening of their primitive wildness, and in counteracting the somberness of their creed. That we find them even in their tomb-paintings engaged in convivial carousings, dancing, races, athletic games, and that they liked their very worship accompanied by the sound of flutes, horns, and trumpets, only shows that that glorious sky of theirs, their intercourse with the nations, their wealth and culture, had gradually caused their antique and gloomy austerity to wear off, even as it wore off with the Romans and other peoples; for to assume with some that the boisterous scenes to which we allude were caused more or less by the despair arising from the loss of their independence, would be going somewhat too far. Licentiousness is the sure forerunner of the fall of a nation, but a whole people does not take refuge in enjoyment when their all is lost. We know little of Etruscan literature; it seems to have consisted mostly of rituals, religious hymns, and some historical works. Whether the Fescennines, certain mocking-songs, sung in alternate verses, with musical accompaniment, at nuptials, originated with them or not, is not decided.

We have alluded to the high proficiency of this people in architecture; they were, in fact, so renowned in this craft throughout the antique world, that, as Solomon called Phenicians to Jerusalem to build his temple, so the Romans sought in Etruria the framers of their grandest masonic structures, such as the Cloaka Maxima, the temple of Jupiter on the capitol, etc. The peculiarly fantastic, and, withal, powerful mind which speaks in all their institutions, equally pervades their architectural productions; but, at the same time, everything they built, they built either for practical or pious purposes. We cannot here enter into a discussion of their manner as it appears in various epochs, but it never reached anything like a distinct national completeness, their eagerness to profit by foreign examples not allowing them to develop it to the full unalloyed. Of their walls and gates, temples and porticoes, theaters and amphitheaters, bridges and sewers, gigantic, and, in the earliest times, cyclopean—evidently erected, in eastern fashion, by hosts of slaves—very little is extant in so complete a form as to give us an exact insight into their mode of construction; and were it not for their tombs, our knowledge would be exceedingly limited. These form one of the most peculiar features in Etruscan antiquities. Hewn in rocks, either below the ground or in the face of a cliff, they were adorned outside with a somewhat Egyptian façade of a temple or a house, which the insides themselves most exactly reproduce, with all their internal decorations, furniture, and utensils. Of the paintings which run round the walls, and which are our safest and most complete guides to the inner life of this nation, we will say more presently. We must not, in conclusion, omit to mention that their temples bore in primitive times, and always retained, in some measure, so far as we can judge, the unfinished character of the wood-buildings of northern mountain tribes—a square, half-house, half-fortification, overloaded with quaint ornamentation.

In their plastic and pictorial arts, Winckelmann has established three distinct styles —to which Dennis has added a fourth—viz., the Egyptian, with Babylonian analogies, the Etruscan or Tyrrhene proper, the Hellenic, and that of the *decadence*. Characteristic of the first style are the prevalence of straight lines, right angles, faces of an oblong, contracted oval, with a pointed chin, eyes mostly drawn upwards, the arms hanging close to the side, the legs close together, the drapery long, in straight parallel lines, the hair disposed in tiers of curls. In this style, the attitude is constrained, the action stiff and cramped. The progress shown by the second style is the greater attention bestowed on the delineation of the muscles, which swell out in disproportionate prominences on the

now almost entirely nude body. The two remaining styles explain themselves. Their statuary, as it appears chiefly on sarcophagi and cinerary urns, suggests likewise an Egyptian origin. The figures are those of their own mystical and awful Hades, instead of the Bacchic processions of Greece and Rome. The grouping follows rather a pictorial than a plastic principle; the motion is hasty and forced; but the features of the deceased, hewn on the lid, have all the rude accuracy of a spiritless portrait. Statues of deities in wood and stone have indeed been found, but very rarely. Of high renown were their ornaments and utensils in baked clay (terra cotta), in the manufacture of which objects the Veientes were especially famous. Rome, at a very early period, possessed of this material a quadriga and the statue of Summanus, made by Etruscans. Of the art of working in bronze, the Etruscans were supposed to be the inventors: that they brought it to a very high degree of perfection, is evident from the examples which remain to us. Statues and utensils were manufactured and exported in immense quantities, not only to Rome, but to every part of the known world. Of figures on a large scale still extant, we may mention the renowned she-wolf of the capitol, the chimæra in the museum of Florence, the warrior of Todi in the Etruscan museum of the Vatican; a portrait-statute of an orator, with the inscription Aule Meteli, in Florence; and the boy with the goose at Leyden. The various objects of ornament and use, found in great numbers in tombs, such as candelabra, cups, tripods, caldrons, couches, disks; articles of armor, as helmets, cuirasses, etc.; musical instruments, fans, cists, or caskets, are most of them models of exquisite finish and artistic skill. Their gems are as numerous as those of Egypt, and like them, cut into the form of the *scarabæus* or beetle. They were exclusively intaglios, and of cornelian, sardonyx, and agate. On these the Etruscan artists represent groups from the Greek mythology, or the heroic cycle, bereft, as they seem to have been, of heroic legends of their own. They are most frequently found at Chiusi and Vulci, and were worn as charms and amulets. Special mention should be made of the metal *specula*, or mirrors, with figures scratched upon the concave side, the front or convex side being highly polished. These ranged over all the phases of Etruscan art, and are especially and peculiarly Etruscan. None but Etruscan inscriptions have ever been found upon them. They will, no doubt, prove eventually of the highest importance, not only by enabling us to follow the gradations of artistic development step by step, but by furnishing us with lists of names of gods and persons, and, it may be, of objects.

Of the vases and urns which are found in innumerable quantities in Etruscan tombs, we cannot treat here, as they are admitted on all hands to be, with very few exceptions, Greek, both in design and workmanship; we must refer the reader to the special article on VASES, but a few words may be added on the before mentioned tomb-paintings. They are found chiefly in the cemeteries of Tarquinii and Clusium; and they are all the more important, as they lead us with minute accuracy from the very cradle of the individual, through the various scenes of his entire life, to its close; and this throughout the existence of the nation itself, beginning before the foundation of Rome, and ending in the empire; while we follow the style in its gradual development from the Egyptian to Græco-Roman perfection. Life in its merriest aspects gleams in the most vivid of colors all round—dancing, feasting, loving, hunting. The Etruscans of later times had learned in the school of the Hellenes to dread death less, and to think of the other world as one of continued joyfulness.

The Etruscan language is preserved in more than 3,000 inscriptions, and this number will no doubt be doubled by the opening of new sepulchral chambers, with which the soil of ancient Etruria is teeming. These inscriptions are found on sarcophagi, urns, vases, columns, statues, and looking-glasses in bronze. The latter article was a favorite object for the representation of scenes from Greek mythology, and from this source we learn the names of the principal native deities. *Tinia*, was Jupiter; *Usil*, the sun; *Fufluns*, Bacchus; *Sethlans*, Vulcanus; *Thurms*, Mercurius; *Turan*, Venus; *Thalna*, Juno; *Thesan*, Aurora. Some of the minor female deities are called *Lasa*, *Maris*, *Mean*, *Vanth*. The inscriptions are of two kinds—the archaic and more recent. The former, generally beginning with the syllable MI, are distinguished not merely by a more ancient form of the alphabet, but also by a more refined condition of the language. In the older inscriptions consonants and vowels are evenly balanced. But in the documents of a later date, short vowels are generally omitted, and in consequence, combinations of consonants appear which remind us strongly of the cacophonous forms of some of the Slavonic languages. Compare the following specimens: 1. *Mi Tesantaiai Tarchumenaia.* 2. *Laris Sesctna Lumscial.*

With regard to the grammar, the following points may be considered as established. In the singular of nouns, the nominative ends in *s;* the genitive, according to the class of declension, in *a-s*, *e-s*, *i-s*, *u-s;* the dative in *si* or *s*. But these terminations are very often dropped, just as in early Latin. In the Cippus Perusinus, both the largest and best preserved inscription of all now in existence, we find of the proper names Velthina and Afuna the cases: *Velthina*, *Velthinam*, *Velthinas;* *Afuna*, *Afunam*, *Afunas*. The suffix *al* serves mostly, but not exclusively, for the expression of a metronymic. *Thana Seianti Latinial*, for example, is Thana Seiantia, *the daughter* of Latinia. Another very common suffix—*asa*, *esa*, *isa*, *usa*—designates the matrimonial relation of women. *Thana Aulnei Canznasa* is Thana Aulneia, the *wife* of Canzna; *Tha Setumnei Pumpunisa*

is Thana Setumneia, the *wife* of Pomponius. It is clear that this suffix consists of the genitives in *as, es, is, us,* with the addition of an *a,* so that grammatically and logically the wife is defined as part and parcel of her husband. Verbal forms do not occur often, but it is certain that the preterite is formed from the root by the addition of the syllable *ce,* like *tur-ce, the-ce, lupu-ce, sval-ce.* The numerals sound rather strange. *Mach, thu, zal, huth, ki, sa,* are 1 to 6; but as yet the individual meaning of each of these is unknown. The same must be said of *sespha, esal, mu* or *muv,* the numerals for 7 to 9. Decades are expressed by *alch(a)l,* e.g., *sespalchal, muvalchl, cealchl.* Ninety was probably *zathrums.* The meaning of about 10 or 12 words, such as *clan,* son; *sech,* wife; *avil,* age; *vril,* year; *hinthial,* spirit; *fleres,* statue, can be clearly established; but as yet no affinity has been discovered between these and the corresponding expressions in languages, whether Arian or otherwise. The following two inscriptions are given with a translation which in one or two points is conjectural:

Vipia Alsinai turce Versenas Caiia.
Vibia Alsinæa dedit Versenæ, Caiæ filiæ.

The second is found on the celebrated bronze statue of the orator, now preserved in the museum of Florence:

Aulesi Metelis Ve Vesial clensi cen fleres tece
Aulo Metello Veliæ Vesiæ filio hoc signum posuit

sansl tenine tuthines chisulics.
jussu concilii publici magistratus (?).

The few bilingual inscriptions (altogether 15) throw no light on the language, as they contain only proper names. The so-called Tyrrhenian glosses, preserved in the lexicon of Hesychius, are worse than useless for critical purposes.

ETRUSCAN LANGUAGE. See ETRURIA, *ante.*

ETSCH. See ADIGÉ.

ETTLINGEN, the chief t. of the circle of Carlsruhe, Germany, on the railway between Manheim and Basel, 4½ m. from Carlsruhe; pop. '75, 5,286. It has manufactures of paper, cotton, starch, powder, etc. There is an old castle built on the site of a Roman fortress. Ettlingen was conquered in 1644 by Taupadel; and near the town, in 1796, Moreau was defeated by the archduke Charles. Roman antiquities are found in the neighborhood.

ETTMÜLLER, ERNST MORITZ LUDWIG, an able writer on German antiquities, was b. 5th Oct., 1802, at Gersdorf, in Upper Lusatia, and studied medicine at Leipsic from 1823 to 1826, but subsequently the language and history of his native country. In 1830, having taken his degree of PH.D. at Jena, he began to deliver lectures there on the German poets of the middle ages; in 1833, he was called to the Zürich academy, and in 1863, to the university there, as professor of German literature. E.'s literary activity has been exhibited chiefly in the editing of the literary remains of the Middle High-German, and older Low-German dialects. To the former belong his *Sant Oswaldes Leben* (Zürich, 1835); *Hadeloubes Lieder und Sprüche* (Zürich, 1840); *Heinrich's Von Meissen des Frouwenlobes Lieder, Leiche, und Sprüche* (Quedlinb. 1843); *Frowen Helchen Süne* (Zürich, 1846); *Heinrich's Von Veldecke Eneide* (Zürich, 1852). Of poems composed in Low German he published, among others, *Theophilus* (Quedlinb. 1849); and *Wizlâwes IV., des Fürsten Von Rügen, Lieder und Sprüche* (Quedlinb. 1852). In 1850 appeared, under his editorship, an Anglo-Saxon chrestomathy; in the following year his much-valued *Lexicon Anglo-Saxonicum.* E. has also given attention to the old Norse literature, as is shown by an edition of the *Völuspâ,* translations, and a Norse reading-book. E. has further written several original poems: his *Deutsche Stammkönige* appeared at Zürich in 1844; his *Kaiser Karl d. Gr. und das Fränkische Jungfrauenheer* in 1847; and his *Karl d. Gr. und der Heilige Goar* in 1852. *Herbstabende und Sommernächte* are essays on his favorite subjects (3 vols., 1865–67).

ETTRICK, a pastoral vale in the s. of Selkirkshire, watered by the Ettrick river, which rises amid bleak hills in the s.w. corner of this co. near Ettrick Pen, 2,258 ft. high, and runs 28 m. n.e., and falls into the Tweed. Its chief affluent is the Yarrow, which runs 25 m. from the w., through one of the loveliest of Scotch vales, and the scene of many a plaintive song. Ettrick forest, a royal hunting tract, swarming with deer till the time of James V., included Selkirkshire and some tracts to the north. In Ettrick Vale, at Tushielaw, dwelt the celebrated freebooter or king of the border, Adam Scot, who was summarily executed by James V. The district derives some note from two persons in modern times—Thomas Boston (q.v.), a Scottish divine, who was minister of the parish of E.; and James Hogg, the Scottish poet, who, having been originally a shepherd in this part of the country, became known as "the Ettrick shepherd."

ETTY, WILLIAM, R.A. This distinguished artist was b. at York, Mar. 10, 1787. His father was a miller and spice-maker. Before he was 12 years of age, he was apprenticed to a printer, and served out his dreary term of seven years, the irksome drudgery of which he himself often afterwards was in the habit of narrating, occasionally soothed by dreams of, on some future day, being an artist. Freed at last, and assisted by some relatives, in 1805, at the age of 18, he entered on the study of art, and, after a year's

probation, was admitted as a royal academy student. His career is very interesting and instructive. It exhibits one gifted with enthusiasm for art, high resolutions, and great industry and perseverance, for a series of years invariably surpassed by many of his fellow-students, and, as has been recorded, "looked on by his companions as a worthy plodding person, with no chance of ever becoming a good painter." Neither prizes nor medals fell to his share as a student; and for several years his pictures were rejected at the royal academy and British institution exhibitions. It was only after six years of hard study that he obtained a place for a picture in the exhibition of the royal academy; and his works only began to attract notice in 1820, when the artist was 33 years of age, and as he himself has said, "having exhibited nine years to no purpose." But the circumstance of E.'s genius being so long unappreciated, did not so much arise from his works evincing no talent, as from his class of subjects, and those technical qualities for which his works are remarkable, not being appreciated at the time; for long before his pictures were salable, his powers were highly appreciated by his professional brethren. On his return from Italy in 1822, where he had been studying the great Venetian colorists, he was elected an associate of the academy. In 1824, his *chef-d'œuvre*, "The Combat—Woman pleading for the Vanquished," was purchased by an artist, John Martin. In 1828, he was elected academician by the members of the royal academy; while in the same year the royal Scottish academy testified its high appreciation of his talents by purchasing the most important of his efforts, the historical work illustrating the history of Judith and Holofernes. Testimonials so high soon had their effect; E.'s pictures came into great request, and brought large prices, and he was enabled amply to repay those who, trusting to his energies, had assisted him when he entered on the contest, in which, after so arduous a struggle, he gained so much honor. He always cherished a love and reverence for York, his native city, and had retired there some time previous to his death, which took place on Nov. 30, 1849.

E. had an exquisite feeling for color, which he most assiduously cultivated by studying the great Venetian masters, and constantly painting from the life; and though, in his drawing, carelessness and incorrectness may often be observed, it is never vulgar, and often possesses much elevation and largeness of style. He generally chose subjects that afforded scope for color, in which the nude and rich draperies were displayed. He executed nine pictures on a very large scale, viz.: "The Combat;" series of three pictures illustrating the delivery of Bethulia by Judith; "Benaiah slaying two Lion-like Men of Moab"—these five, which are the best of his large works, were purchased by the royal Scottish academy, and are now in the Scottish national gallery—"The Syrens," now in the Manchester institution; and three pictures illustrating the history of Joan of Arc. His smaller works are numerous. Besides his large works above referred to, he sent for exhibition to the royal academy and British institution, between 1811 and 1849 inclusive, no less than 230 pictures, many of them composed of numerous figures, and all remarkable for exquisite color. The following may be particularly noted: "The Coral-finders;" "Venus and her youthful Satellites arriving at the Isle of Paphos;" "Cleopatra's Arrival in Cilicia;" a composition from the eleventh book of *Paradise Lost* ("Bevy of Fair Women"); "The Storm;" "Sabrina;" "The Warrior Arming;" "Youth at the Prow, and Pleasure at the Helm;" "The Dance," from Homer's description of Achilles's Shield; "Britomart redeems Fair Amoret;" "Dance on the Sands, and yet no Footing seen;" "Amoret Chained."—Compare E.'s life by Gilchrist (Bogue, London, 1855).

ETYMOLOGICUM MAGNUM, a Greek lexicon of unknown authorship, said to be the oldest extant in that language. It is thought to have been made in the 10th century.

ETYMOLOGY (Gr.) is that part of grammar that treats of the derivation of words. It embraces the consideration of the elements of words, or letters and syllables, the different kinds of words, their forms, and the notions they convey; and lastly, the modes of their formation by derivation and composition. Etymological inquiries have formed a favorite pursuit from the earliest times. In the book of Genesis, numerous indications are given of the derivation of proper names. Homer also attempts etymologies of the names of gods and men, which, however, can only be looked upon as more or less ingenious fancies. The grammarians of Alexandria and Varro among the Romans tried to base their etymologies on something like principle; but the wildest conjectures continued to be indulged in, and the results were little better than guess-work down to a very recent period. As philology extended its sphere, and became acquainted with the languages and grammarians of the east, who far excelled those of the west in this particular, etymology took on a new form. It no longer sought the relations of the words of a single language exclusively within itself, but extended its view to a whole group, e.g., the Teutonic, or wider still, to a whole family, as the Indo-European, or Aryan (q.v.), and became a new science under the name of comparative grammar. See PHILOLOGY.

Etymologicum Magnum is the name of a Greek lexicon, the oldest of the kind, professing to give the roots of the words. It appears to belong to the 10th c.; the author's name is unknown. The etymologies are mere guesses, sometimes right, often wildly absurd; but the book is valuable, as containing many traditions and notices of the meanings of old and unusual words. There is an edition by Schäfer (Leip. 1816); one

by Sturz, called *Etymologicum Gudianum* (Leip. 1818); and another by Gaisford (Oxf. 1849).

EU, a tolerably well-built t. of France, in the department of the Lower Seine, in Normandy, situated near the mouth of the Bresle, 93 m. n.n.w. of Paris. It is remarkable for its fine Gothic church, and for the château d'Eu, a low building of red brick, with high tent-shaped roofs of slate. E. manufactures sail-cloth, ropes, soap, lace, and silk. Pop. '76, 4,169. In the 11th and 12th centuries, E. was in the possession of the counts of the same name, a collateral branch of the Norman royal family. After various vicissitudes, it was purchased by Mademoiselle de Montpensier in 1675, whose fanciful taste has perpetuated itself in the architecture and decoration of the château. At a later period, it came into the possession of the duke of Maine, from whom it passed to the duke of Penthièvre, the maternal grandfather of Louis Philippe, who succeeded to it in 1821. Louis Philippe expended large sums on the embellishment of the château, and especially on its magnificent park and the unique portrait-gallery. It has besides acquired a new historical association through the visits of the queen of England in 1843 and 1845. The eldest son of the duke of Nemours (born 29th April, 1842) received from his royal grandfather the title of Count d'Eu. Compare Vatout, *Le Château d'Eu, Notices Historiques* (5 vols., Paris, 1836), his *Résidences Royales* (Paris, 1839).

EU, Prince Louis Philippe Marie Ferdinand Gaston d'Orleans, Compte d', b. France, 1842; eldest son of duke de Nemours and grandson of Louis Philippe. In 1864, he was married to Isabel, heiress-apparent of the throne of Brazil. He is a marshal in the Brazilian army, and was commander-in-chief of the allied forces in the war with Paraguay in 1869. He defeated Lopez, and proclaimed the abolition of slavery in Paraguay.

EUBŒ'A (ancient, *Euboia;* Turkish, *Egripo;* Ital. *Negroponte*), the largest island in the Ægean sea, forms a portion of the present kingdom of Greece. Until recently, it was called Negropont. It is bounded on the n. by the Trikeri channel, and on the w. by those of Talanta and Egripo. It extends in a direction parallel to the mainland; is 105 English statute m. long, and 30 m. in extreme breadth, although in one part its breadth is scarcely 4 miles. At the narrowest part, it is connected with the mainland by a bridge. The island is intersected by a chain of mountains, running n.w and s.e., and attaining in the center, in the range of Mt. Delphi, an elevation of about 4,500 feet. Copper and other metals are obtained in the island, which also contains numerous hot springs. The pastures are excellent, and the declivities of the mountains covered with forests of fir-trees, The climate is salubrious, the valleys well watered and very fertile, but little cultivated. The chief products are cotton, oil, wine, wheat, fruit, and honey. The inhabitants are chiefly engaged in the breeding of cattle; they export wool, hides, and cheese, as well as oil and grain. The chief towns are Chalcis (q.v.) on the n., and Carystos on the s. coast, the latter having a population of 3,000. E. was peopled in the early historic times chiefly by Ionic Greeks, and afterwards by colonists from Athens, who formed a number of independent cities or states. These were at first monarchical in their constitution, but at a later period democratic. They soon rose to power and prosperity. After the Persian wars, however, E. was subjugated by the Athenians, under whose rule it continued till they, in their turn, were subdued by Philip of Macedon. By the Romans, it was finally united with the province of Achaia under Vespasian. In 1204, it came into the possession of the Venetians, and received the name of Negroponte. In the year 1470, the island was taken by the Turks, in whose hands it remained till 1821, when the inhabitants rose to vindicate their independence at the call of the beautiful Modena Maurogenia. It now forms a portion of the modern kingdom of Greece, and has a population of (1870) 82,541.

EUBU'LIDES, a philosopher of Miletus and contemporary of Aristotle, whose philosophy he attacked with great severity. Demosthenes is said to have been one of his pupils. He is not known to have written any independent work.

EUCALYP'TUS, a genus of trees of the natural order *myrtaceæ*, suborder *leptospermeæ*, containing a large number of species, mostly natives of Australia, and which, along with trees of nearly allied genera, form one of the most characteristic features of the vegetation of that part of the world. The genus occurs also, although much more sparingly, in the Malayan archipelago. The trees of this genus have entire and leathery leaves, in which a notable quantity of a volatile aromatic oil is usually present. The leaves, instead of having one of their surfaces towards the sky, and the other towards the earth, are often placed with their edges in these directions, so that each side is equally exposed to the light. Many of the species abound in resinous secretions, and are therefore called Gum Trees in Australia. Some of them attain a great size; some are found with trunks from 8 to 16 ft. in diameter; a plank 148 ft. in length was exhibited at the great exhibition of 1851. They are of very rapid growth; and their timber, when green, is soft, so that they are easily felled, split, or sawn up; but when dry, it becomes very hard. It is used for a great variety of purposes, amongst which may be mentioned ship-building. The bark of many of the species abounds in tannin, and has become to some extent an article of commerce. Some kinds of it are said to be twice as strong as oak-bark. The bark of some is remarkable for its hardness; whilst some throw off their outer bark in

longitudinal strips or ribbons, which, hanging down from their stems and branches, have a very singular appearance.—Among the resinous secretions of this genus is the substance called BOTANY BAY KINO, which is used in medicine as a substitute for kino (q.v.). It is the produce of *E. resinifera*, a species with ovato-lanceolate leaves, known in Australia as the RED GUM TREE and IRON BARK TREE, a very lofty tree, attaining a height of 150–200 ft. When the bark is wounded, a red juice flows very freely, and hardens in the air into masses of irregular form, inodorous, transparent, almost black when large, but of a beautiful ruby red in small and thin fragments. Botany bay kino is said to consist chiefly of a peculiar principle called *eucalyptin*, analogous to tannin. About sixty gallons of juice may sometimes be obtained from a single tree, or, in the course of a year, as much as five hundred pounds of kino.—*E. robusta*, STRINGY BARK TREE, also a lofty tree, yields a most beautiful red gum, which is found filling large cavities in its stem, between the concentric circles of wood.—*E. mannifera* yields, from its leaves, an exudation resembling manna, less nauseous, and of similar medicinal properties. It contains a saccharine substance, different from *mannite*, from *glucose*, and from all previously known kinds of sugar. Another similar exudation, from the leaves of *E. dumosa*, is sometimes seen spread over large districts like snow, and used by the natives as food.—The Tasmanian blue gum tree, which is one of the eucalypti, has recently acquired great reputation for its effects in drying marshy soils, and in preventing malarious diseases. It is extremely rapid in its growth, which may account for its drying powers; and this, in its turn, may partly account for its salubrious effects; although its camphor-like odor may also have to do with it. It has been tried with decidedly beneficial effects in the cape of Good Hope, Algeria, the Roman Campagna, and elsewhere. Unfortunately, it does not bear a severe winter.

EUCALYPTUS (*ante*). Eucalyptus has recently had a popular reputation as an efficient remedy in intermittent fever. More than forty years ago the crew of a French war vessel were treated, it is said, successfully with eucalyptus, at Botany bay. Peasants of Valencia, a Spanish province, were found using it in 1867. Dr. Ramel, of Valencia, wrote of it to a brother physician in the highest terms as a febrifuge. In 1871, Dr. Keeler, a physician to some railways, reported that he found it as efficient as cinchona, and others have regarded it highly as a remedy for the pernicious form of intermittent (see INTERMITTENT FEVER). Other physicians do not find the same virtues, and others, again, account for this by the fact that different species have been employed; the *E. latifolius* failing where the *E. longifolius* succeeds. A report of Dr. Burdel of France, whose observations were made in the marshy department of La Sologne, where malarial fever prevails extensively, states that out of 123 cases only 11 were cured without relapse, and these were treated in a hospital. It was moreover observed that in those cases where the paroxysms were broken, the malarial cachexia remained. On the whole, the virtues which have been claimed for eucalyptus do not seem to be regarded by the majority of the medical profession as having been verified.

EUCHARIST. See LORD'S SUPPER.

EUCHLO'RINE is a very explosive green-colored gas, possessing bleaching properties, and is prepared by heating gently a mixture of 2 parts hydrochloric acid, 2 of water, and 1 of chlorate of potash. It explodes when merely touched with a hot wire, and is most likely composed of a mixture of chlorine and chlorochloric acid ($2ClO_5,ClO_3$).

EUCHRE, a game of cards said to be of German origin, but now very popular as a social pastime in the United States. Thirty-two cards are used in E., the twos, threes, fours, fives, and sixes being rejected in a complete pack. Before the game is started the players cut for deal, which belongs to him who first draws a knave or the lowest card according to agreement. The non-dealer then cuts to his opponent, who deals five cards to each, by two at a time and three at a time or vice versa. The dealer turns up the top of the undealt cards for trumps. In suits not trumps the cards rank as at whist; in the trump suit the knave (termed the right bower) is the highest trump, and the other knave of the same color, either black or red (termed the left bower) is the next highest, this card being, of course, omitted from the suit to which it would otherwise belong. The other trumps rank as already stated, the queen being next above the ten. The best form of the game is when played by four persons, but two, three, or even more than four persons may play, if the rules be adapted accordingly. In two-handed euchre the non-dealer looks at his hand and decides whether he will play it. If he be satisfied and think he can make three tricks, he "orders up." The dealer then discards his lowest and least useful card, and is entitled to take the trump card into his hand; in this case, however, he must succeed in taking three tricks, or he is "euchred," and his opponent scores two points. If the non-dealer be not satisfied with his hand, he says "pass." The dealer then has the option of taking up the trump as before, or of passing also. If the trump be ordered up or taken up, the play of the hand commences; if both players pass, the dealer places the trump card face upwards underneath the pack, called "turning it down." The non-dealer has then the privilege of naming the suit which shall be trumps, which must be another than that previously turned up. If he "make" a trump, he must succeed in taking three tricks or he is euchred; but if he pass it again, the dealer has the option of making it. If both pass a second time, the hand is thrown up, and the other player deals. When the card turned up is red and

the trump is made red, it is called "making it next;" the same with black. If the trump be made of a different color from the turn up, it is called "crossing the suit." If the hand be played, the non-dealer leads; the dealer plays to the card led. He must follow suit if able, otherwise he may play any card he pleases. If the left bower is led, a trump must be played to it. The highest card of the suit led wins the trick; trumps win other suits. The winner of the trick leads to the next. If a player make all five tricks he scores a "march," equal to two points; if he make three or four tricks he scores one point. In three-handed euchre the option of playing or passing goes to each in rotation, beginning with the player to the dealer's left. Three cards, one from each hand, constitute a trick. The player who orders up, takes up, or makes the trump, plays against the other two, and if they succeed in euchring him, each of them scores two points. This is often termed "cut-throat euchre," because any one of the three players is liable to be opposed by the other two. Four-handed euchre is generally played with partners, who are cut for, and sit opposite each other as at whist; if a player have a strong hand he can decide to "play alone" single-handed against the two adversaries, and his partner cannot object. Should the lone player succeed in making a march he scores four; if he win three or four tricks he scores one; if he fail to win three tricks the opponents score two. The popularity of euchre in this country is due mainly to its simplicity and mirth-provoking qualities. It is played in many different ways, as the game is not bound by any strict set of rules. Sometimes a blank card called "little joker" or "the joker" is added, and is the highest card in the pack, the bowers following; sometimes it is agreed upon to allow the player who makes more than five points to carry the surplus (called a lap) to the next game; or to allow a "lone player" to call for his partner's best card.

EUCLASE, a silicate of alumina and glucina occurring in greenish crystals; it is hard, and will bear a high polish, but is fragile and not much used in jewelry. It is found in South America.

EUCLID, of Megara, a Greek philosopher, has often been confounded with the mathematician of the same name. He was one of the earliest disciples of Socrates. Although Megara lay at a considerable distance from Athens, and all Megarians were forbidden to enter the Athenian territories under pain of death, E. came into the city in the evening in female disguise, to enjoy the instruction of Socrates. After the death of his master, he established a school of his own, which received the name of the Megaric school. His death took place about 424 B.C. The basis of his system was in the Eleatic dogma of a one, only, universal substance or existence. Blending with this the Socratic idea of the predominance of the moral element, E. held this one real existence to be *the good,* though it receives various names under its special manifestations.

EU'CLID, sometimes called the father of mathematics, was b. at Alexandria, about 300 B.C. We know little more of his history than that he belonged to the Platonic school of philosophy, and taught mathematics in the famous school of Alexandria, during the reign of Ptolemy Soter. Though he did not create the science of mathematics, as is sometimes represented, he made prodigious advances, especially by his rigorous method and arrangement. In this respect he has perhaps never been excelled, and his *Elements of Geometry* continue to the present day to hold their place as a text-book of that science. Besides the Elements, there are extant treatises on music, optics, data, etc., ascribed to E., the authenticity of some of which is doubtful. The best editions of the whole reputed works of E. are those of David Gregory (Oxf. 1703) and Peyrard (3 vols., Par. 1814–18). The oldest Greek edition of the Elements appeared at Basel, 1533; the best is that of August (2 vols., Berlin, 1826). Of English editions of E.'s Elements, those of Simpson and Playfair are considered the best. There is a full account of everything connected with E. and his works in Smith's *Dictionary of Greek and Roman Biography.*

EUDIOM'ETER (Gr. *eudios,* good, and *metron,* measurer) is an instrument originally introduced as a measurer of the goodness of air in any locality, but which is now employed generally in the analysis of gases for the determination of the nature and proportions of the constituents of any gaseous mixture. The instrument is now made of glass in the form of a tube, which is hermetically sealed at one end, and open at the other. The tube may be straight, or bent in the shape of the letter U. In either case, the tube is graduated or marked off in equalized divisions from the closed end onwards, so as to admit of the volume of gas placed within being accurately measured; and two platinum wires are inserted through the glass near the shut end of the tube, and closely approach, but do not touch, each other. These wires are intended for the conveyance of electric sparks through any mixture of gases, so as to cause the combustion of certain of them. For the modes of manipulating with the eudiometer, see GAS, ANALYSIS OF.

EUDO'CIA, the name of several Byzantine princesses, of whom the most important is the wife of the emperor Theodosius II. She was the daughter of the sophist Leontius or Leon, and was educated by her father, who instructed her in the literature of Greece and Rome, in rhetoric, geometry, arithmetic, and astronomy. Her accomplishments and her singular beauty were reckoned by Leontius a sufficient fortune, for at his death

he left all his property to her two brothers. E. appealed to the emperor at Constantinople. Pulcheria, the sister of Theodosius, was interested in the maiden, and thought she would make a suitable wife for the emperor. But as E. (or, more properly, Athenais, for this was her name until her baptism) had been brought up a pagan, it was necessary first to convert her. This was easily accomplished. E. was married to the emperor in 421 A.D. For many years, however, Pulcheria ruled in the imperial household and councils, E., according to Nicephorus, "submitting to her as mother and Augusta;" but in 447, a quarrel broke out between them in regard to the Eutychian heresy, of which E. had become a supporter. At first, E. was triumphant, and Pulcheria was banished; but in a short time the emperor was reconciled to his sister, and treated E. so sharply that she retired to Jerusalem, where she died 460–61 A.D. Her latter days were spent in works of piety and charity. She enriched churches, rebuilt the walls of the holy city, and founded many monasteries and hospitals. Through the influence of the famous Symeon Stilites, she was induced to renounce Eutychianism, and become an orthodox Catholic Christian. E. was a poetess of considerable merit. She wrote a poem in heroic verse on the victory obtained by the troops of Theodosius over the Persians, 421 or 422 A.D.; a paraphrase of eight books of Scripture, a paraphrase of Daniel and Zechariah; and a poem in three books on the history and martyrdom of Cyprian and Justina. The authorship of *Homero-Centones* has also (but without sufficient reason) been attributed to her. This is a work composed of verses taken from Homer, and so arranged as to appear a history of the fall of man and of his redemption by Christ. It has been often published.

EUDOX'US, of Cnidus, called by Cicero the prince of astronomers, flourished about 366 B.C. He studied under Plato for some time, and afterwards went to Egypt, where he resided for thirteen years, and had much intercourse with the Egyptian priesthood, from whom he is supposed to have derived his superior knowledge. His last years are said to have been spent on the summit of a high hill, that he might have the starry heavens ever before his eyes. There is little reason for believing that E. deserves any great admiration for his attainments in astronomy. He probably introduced the sphere into Greece, and may have corrected the length of the year, upon Egyptian information, but he appears to have been an indifferent observer of heavenly phenomena, and Delambre considers that he was ignorant of geometry. E.'s works are entirely lost, and our only reliable sources of information regarding him are the poem of Aratus and the commentary of Hipparchus.

EUFAU'LA, a city in Barbour co., Ala., on the Chattahoochee, at the junction of the Montgomery and Eufaula, the Georgia Southwestern, and the Vicksburg and Brunswick railroads; 80 m. e.s.e. of Montgomery; pop. '70, 3,185. It is an important cotton shipping point, and has considerable manufacturing business.

EUGENE, FRANÇOIS (le prince François-Eugene de Savoie-Carignan), better known as prince Eugene, equally distinguished as a gen. and as a statesman, was b. at Paris, 18th Oct., 1663. He was the son of Eugene Maurice, count of Soissons, and of Olympia Mancini, a niece of cardinal Mazarin. He was intended for the church; but the banishment of his mother to the Low Countries, by the orders of Louis XIV., was so deeply resented by him, that he indignantly renounced his country, and entered the service of the emperor Leopold as a volunteer against the Turks. Subsequently, the French government made him the most flattering offers, but he never returned to the service of his native country. He displayed extraordinary military talent in the Turkish war, especially at the famous siege of Vienna in 1683, and soon rose to a high position in the army. In the coalition war against Louis XIV. in Italy, he took an active part; and in 1691, was raised to the command of the imperial army in Piedmont. On his return to Vienna, he was placed at the head of the army of Hungary, and defeated the Turks, with immense slaughter, in the famous battle of Zenta, Sept. 11, 1697. The booty obtained was almost incredible, amounting to several millions sterling. In 1701, broke out the Spanish war of succession. E. for two years commanded the army of Italy, but his forces were too small for him to accomplish anything of importance. In the year 1703, being appointed president of the council of war, he became thenceforth the prime mover of every undertaking. He first took the command of the imperial army in Germany, and along with Marlborough gained a brilliant victory at the battle of Blenheim, 13th Aug., 1704, when the two commanders defeated the French and Bavarian army. E. afterwards saved Turin, and expelled the French from Italy in the year 1706. He shared, too, with Marlborough the glory of the fields of Oudenarde (in 1708) and Malplaquet (in 1709); but being crippled in his resources by the retirement of Holland and England from the contest, he was unable to withstand the enemy on the Rhine, and his defeat by Villars at Danain, 24th July, 1712, was followed by other disasters, until the peace of Rastadt put an end to the war. In 1716, on the recommencement of the war against the Turks, E. defeated an army of 180,000 men at Peterwardein, took Temeswar, and in the year 1717, after a bloody battle, gained possession of Belgrade. After the peace of Passarowicz, which was concluded in the following year, he returned covered with glory to Vienna, where, during the succeeding years of peace, he labored with unwearied energy in the cabinet. When the question of the succession to the throne of Poland brought on a new war with France, E. appeared

again on the Rhine; but being now advanced in years, and destitute of sufficient resources, he was unable to accomplish anything of importance. After the peace, he returned to Vienna, where he died, 21st April, 1736. E. was small in stature, with thin face, and long nose; he was simple in dress and manner, and indulged profusely in snuff. An enthusiast in his profession, and a strict disciplinarian, he was also kind-hearted and sympathetic, and always carefully attended to the wants of his men. He introduced no new tactics in the art of war, and was deficient in the guidance and command of masses; but by his rapidity of perception and decision, and faculty for making the best of existing circumstances, which was his *forte*, he raised the *prestige* of the Austrian arms to an eminence unequaled before or since his time. He successively served under three emperors, of whom he was wont to say, that in Leopold I. he had a father, in Joseph I. a brother, and in Charles VI. a master. E.'s political writings, published by Sartori, are important for the light they throw upon the history and manners of the time. Compare Dumont, *Histoire Militaire du Prince Eugene;* Ferrari, *De Rebus Gestis Eugenii* (Rome, 1747); Campbell's *Military History of Prince Eugene and the Duke of Marlborough;* and the monographs of Kausler (1838), Arneth (1858), and Von Sybel (1861).

EUGE'NIA, a genus of plants of the natural order *myrtaceæ*, nearly allied to *myrtus* (see MYRTLE), and differing only in having a 4-parted instead of a 5-cleft calyx, four instead of five petals, and a 1 to 2-celled berry, with one seed in each cell. The species are trees and shrubs, natives chiefly of tropical and sub-tropical countries. The dried fruit of *E. pimento* and *E. acris* forms the spice well known as allspice, Jamaica pepper, or pimento (q.v.). The seeds of *E. tabasco* are also used as a condiment. Other species yield some of the finest fruits of tropical regions, remarkable for their delicious balsamic odors. Among these is the MALAY APPLE (*E. malaccensis*), a native of the Malayan archipelago and of the South Sea islands, a low tree, with ovate-oblong smooth leathery leaves, and fruit in size and shape resembling a small apple, of a beautiful red color, and with a white juicy pulp. This fruit has an agreeable odor, like that of the rose, whence it is sometimes called ROSE APPLE; a name which, on the same account is often extended to the fruits of allied species, as *E. aquea*, and which is very often given to the JAMBOS or JAMROSADE (*E. jambos* or *jambosa vulgaris*), an East Indian fruit, now cultivated in all tropical countries. This fruit is pear-shaped, about the size of a hen's egg, white or red. The tree is about 20 or 30 ft. high, much branched, with leaves somewhat like those of the peach, and greenish-yellow flowers in terminal bunches. *E. cauliflora*, a Brazilian species, cultivated in most of the gardens of the diamond and gold districts of the s. of Brazil, yields a very fine fruit of a black color, about the size of a greengage plum, called the JABUTICABA or JABOTICABUROS. Similar fruits are produced by other Brazilian species, particularly *E. dysenterica*, *E. inocarpa*, and *E. Braziliensis*. The BASTARD GUAVA (*E. pseudo-psidium*) and the CAYENNE CHERRY (*E. cotonifolia* and *E. Michelii*) produce fruits which are held in considerable esteem in the West Indies. One species only, the UGNI (*E. ugni*), a native of Chili, appears to be sufficiently hardy for the climate of Britain; it endures at least that of the s. of England; it has been recently introduced, and much extolled as a fruit shrub. Its flowers are very fragrant, and its fruit pleasant. It is much cultivated in Chili, and a very refreshing beverage, with an agreeable balsamic odor, is made of the expressed juice mixed with water. The fruit is of the size of a black currant, somewhat flattened, and of a brownish-red color.—The bark of many species of E. is very rich in tannin. Some produce good timber.

EUGENIE-MARIE DE GUZMAN, formerly empress of the French, was b. at Granada in Spain, 5th May, 1826, and is the second daughter of the count of Montijo and of Marie Manuela Kirkpatrick. She is descended, on the father's side, from an old and noble Spanish family, which, by marriages at various times, acquired the right to assume the names of Guzman, Fernandez, Cordova, La Cerda, and Levia, and contracted alliances with the noble families of Téba, Banos, and Mora. By her mother—also born in Spain, and the daughter of Mr. Kirkpatrick, who was for some time English consul at the Spanish seaport of Malaga—she is connected with an ancient Scottish family—the Kirkpatricks of Closeburn—which still exists, but no longer in possession of their original property. She was educated principally at Madrid, and spent a great portion of her youth in traveling with her mother, under the name of the countess de Téba. In 1851, she appeared at the *fêtes d'Elysée* in Paris, where her beauty and graceful demeanor attracted the notice and excited the admiration of the emperor of the French, who married her on the 30th Jan., 1853, at Notre Dame. On that occasion an amnesty was granted to 4,312 political prisoners. In 1859, Eugenie-Marie de Guzman filled with ability the office of regent. During the war in 1870, Eugenie-Marie de Guzman was again regent, but had to flee to England after the emperor became a captive. Her only son, the prince imperial, born 16th Mar., 1856, completed his military education in England, and was killed in 1879 while serving as a volunteer in the Zulu war.

EUGE'NIUS is the name of four popes, of whom the last is the most important. E. IV., a native of Venice, became pope in 1431. The great event in his career was the schism created in the church by the proceedings of the council of Basel, which had been convoked by E.'s predecessor, Martin V., and showed a strong tendency to ecclesiastical

reform. E. was kept in perpetual trouble by this council, and at last, having been compelled to flee from Rome, opened a new council at Ferrara in 1438, and issued a bull of excommunication against the bishops assembled at Basel, whom he pronounced to be "a satanic conclave, which was spreading the abomination of desolation into the bosom of the church." The result was, that the council of Basel formally deposed him from his pontifical office in 1439, and elected in his stead Amadeus VIII., duke of Savoy, under the title of Felix V. The conduct of France and Germany seemed to warrant this bold step, for Charles VII. had introduced into the former country the decrees of the council of Basel, with some modifications, through the pragmatic sanction (1438), and the same thing happened in Germany by means of the deed of acceptance (1439). At the council of Ferrara, John Paleologus II., emperor of Constantinople, and upwards of 20 Greek bishops, presented themselves, and a union between the two great divisions of Christendom—the Greek and Latin church—was for a moment effected in July, 1439. Discord, however, broke out almost immediately, and the two have ever since remained separate. E.'s rival, Felix, did not obtain much recognition, and after the death of the former at Rome, in 1447, he had to give way in favor of Nicholas V. E.'s pontificate was stormy and unhappy, and in his old age he is said to have regretted that he ever left his monastery.

EU'GUBINE TABLES (Lat. *Tabulæ Eugubinæ*), the name given to seven bronze tablets, the inscriptions on which present a comprehensive and very remarkable memorial of the Umbrian language. They were discovered in 1444 at Gubbio (the ancient Iguvium or Eugubium), where they are still preserved. The characters on four of the tablets are Umbrian, on two Latin, and on one partly Latin and partly Umbrian. The *language* employed, however, is in all cases the same, and differs both from Etruscan and Latin, but resembles somewhat the older forms of the latter, and also the Oscan dialects, so far as we know them. The subjects of the inscriptions are directions concerning sacrificial usages and forms of prayer, and they seem to have been inscribed three or four centuries before the Christian era. Philip Bonarota first published them in a complete form in Dempster's *Etruria Regalis* (2 vols., Florence, 1723–24). The first really judicious attempt at interpretation was that of Lanzi, in his *Saggio di Lingua Etrusca* (3 vols., Rome, 1789), who points out the important fact that they related to sacrificial usages, etc. His views have been carried out by Ottfried Müller in his work *Die Etrusker;* Lepsius, *De Tabulis Eugubinis*, etc. The most accurate copy of the inscriptions is that given by Lepsius in his *Inscriptiones Umbricæ et Oscæ* (Leip. 1841); the best and most complete work on the language and contents of the tablets is that of Aufrecht and Kirchhoff, entitled *Die Umbrischen Sprach. Denkmäler* (2 vols., Berlin, 1849–51).

EULENSPIEGEL, the hero of a *Volksbuch* or German popular comic tale, often alluded to by various old authors, entitled the *Story of Tyll Eulenspiegel*, which relates the freaks, pranks, drolleries, fortunes, and misfortunes of a wandering mechanic. "It were long to detail his fearful jokes, which sometimes brought him to the gallows, yet saved him from the halter. He was buried with his coffin standing on one end at Möllen, near Lübeck; and you may see his grave under the great lime-tree in the churchyard, and his rebus, to wit, an owl and a looking-glass, cut upon the stone." Ulenspiegel, as he is sometimes called in German, has almost made the tour of Europe. His life was first published in the Nether-Saxon dialect, in 1483. Our English translation of *The merrye jests of a man that was called Howleglass, and of many marveylous thinges and jestes that he did in his life in Eastland*, was "Imprinted at London in Tamestreete, at the Vintre, in Three Craned Warfe, by Wyllyam Copeland."

A High-German version, the work of Thomas Murner, the Franciscan monk, was printed at Strasburg in 1519. A Latin translation was made by Nemius, and numerous French translations have appeared of the book. An English edition was published in 1860, under the direction of Kenneth R. H. Mackenzie, and with illustrations by Alfred Crowquill. There is no complete copy of the original, but portions in the royal library at Vienna and the royal library at Berlin complement each other.

EU'LER, LEONARD, one of the greatest of mathematicians, was b. at Basel, April 15, 1707, and received his first instructions in the science, for which he afterwards did so much, from his father, who was pastor of the neighboring village of Riechen. At the university of Basel, he studied under John Bernouilli, and was the friend of Daniel and Nicholas Bernouilli. At the age of 19, he was second in the contest for a prize offered by the academy of Paris for the best treatise on the masting of ships. His friends, the Bernouillis, had been called to St. Petersburg by Catharine I., when she founded the academy, and they now induced E. to settle in that capital, in 1730, as professor of physics. Three years later he exchanged his professorship for a place in the academy. From that time he continued to labor in the field of mathematics with an ardor really astonishing. More than half the mathematical treatises in the 46 quarto volumes published by the St. Petersburg academy from 1727–83 are by E., and at his death he left more than 200 treatises in MS., which were afterwards published by the academy. The Paris academy of science awarded him the prize on ten several occasions, one of which was his treatise on Tides, 1740. In 1741, he accepted the invitation of Frederick the great to Berlin. He afterwards, 1766, returned to St. Petersburg,

where he was made director of the mathematical department of the academy, and died Sept. 7, 1783. The last years of his life were spent in total blindness.

E. was of an amiable and religious character, always cheerful and good-humored; in society, he was distinguished for his agreeable wit. It was doubtless his residence in St. Petersburg that led him to the application of mathematics to the building and management of ships, as embodied in his *Théorie de la Construction et de la Manœuvre des Vaisseaux* (Petersb. 1773). The great problems left by Newton to his successors were the objects of his unceasing research. On physical subjects, E. often adopted extremely untenable hypotheses. He occupied himself also with philosophy in the proper sense of the word. He undertook to prove the immateriality of the soul, and to defend revelation against freethinkers. In his *Lettres à une Princesse d'Allemagne sur quelques Sujets de Physique et de Philosophie* (3 vols., Berl. 1768; new ed., Par. 1812; and which have also been translated into English), he attacked Leibnitz's system of monads and of a pre-established harmony. But this was not the field in which he was best calculated to shine; his proper domain was the abstruser parts of pure mathematics. His most important works of this class are his *Theory of Planetary Motion; Introduction to the Analysis of Infinites; Institutions of the Differential and of the Integral Calculus;* and *Dioptrics;* which are all, as well as his *Opuscula Analytica,* in Latin. His *Introduction to Algebra* is well known.

EU'MENES, 360–315 B.C.; a native of the Thracian Chersonesus; private secretary to Philip of Macedon, and also to his son Alexander the great, under whom he was a commander of the cavalry. After Alexander's death, the provinces and armies were divided among his generals, and the countries assigned to Eumenes were Cappadocia and Paphlagonia, with the sea-coast of Pontus as far as Trapezus; but as they were not yet subdued, Leonnatos and Antigonus were charged by Perdiccas to put Eumenes in possession. Antigonus disregarded the order, and Leonnatus, having in vain endeavored to induce Eumenes to accompany him to the assistance of Antipater in Europe, made an unsuccessful attack on Eumenes's life. But Eumenes escaped and joined Perdiccas, who assisted him in getting possession of Cappadocia. He did not rule long, having the enmity of many powerful generals. He was betrayed by his own soldiers, and put to death.

EUME'NIDÉS (literally, the well-minded or benign goddesses) was the euphemistic name of certain fearful beings, whose true name of erinnyes (from *erino,* I hunt up, or *erinuo,* I am angry) it was considered unlawful to utter. Their Latin name was *furiæ* or *diræ.* We find them mentioned by the earliest poets, and they play a prominent part in the writings of the tragedians, where their sphere of action is much extended. In the earliest times, Homer and Hesiod represent them as avenging and punishing perjury and murder, as also the violation of filial duty and of the rite of hospitality; they were also regarded as goddesses of fate (like the parcæ), and had a share in the grim providence which led the doomed ones into the way of calamity. A part of their function was also to hinder man from acquiring too much knowledge of the future. In these poets, their number is sometimes undefined; sometimes they appear as one. The limitation to the number three, as well as their names Alecto, Megæra, and Tisiphone, is of a later period, a whole chorus of erinnyes appearing in the writings of Æschylus. According to Homer, they dwelt in Erebus, and with this the duration after death of the punishments which they inflict is connected. Hesiod calls them the daughters of Ge and Uranus. Æschylus describes them as having the features of gorgons and harpies, their bodies covered with black, serpents twined in their hair, and blood dripping from their eyes. The later poets and sculptors represented them in the more pleasing form of winged virgins, attired in the garb of huntresses, bearing torches in their hands, and with a wreath of serpents round their heads. Gradually, they came to be considered goddesses of the infernal regions, who punished crimes after death, but seldom appeared on earth. In Athens, their worship, which, like that of the other infernal deities, was conducted in silence, was held in great honor. The sacrifices offered to them were black sheep and libations of *nephalia*—i.e., honey mixed with water. The turtle-dove and the narcissus were sacred to them. They had a sanctuary in the vicinity of the Areopagus, and one at Colonus.

EUMOL'PUS (the "sweet singer") was, in the later mythology of Greece, the son of Poseidon and Chione. He was brought up in Ethiopia, whence he went to Thrace, and afterwards passed into Attica, at the head of a body of Thracians, to assist the Eleusinians in their war against Erechtheus, king of Athens. E. and his sons are said to have been slain in battle. He is spoken of as the founder of the Eleusinian mysteries. A distinction is made by some of the ancient writers between this E. and a son of Musæus bearing the same name. The latter is represented as a scholar of Orpheus, and the instructor of Hercules; but E.'s history, like all mythological stories, is involved in great obscurity and confusion. The name of E. is one of the series of those old priestly singers who, by the institution of religious ceremonies, spread culture and morality among the rude inhabitants of Hellas. An illustrious Athenian family, the *Eumolpidæ,* derived their descent from E., and held the office of priests of Demeter in Eleusis.

EUNAPIUS, b. 347 A.D.; a Greek sophist, and enemy of Christianity. He possessed some knowledge of medicine, and was a teacher of rhetoric at Athens. He wrote *Lives of the Sophists*, and a continuation of the history of Dexippus.

EUNOMIUS, the founder of the Arian sect of Eunomians, was b. in the village of Dacora, in Cappadocia, and was first a lawyer, then a soldier, and ultimately took holy orders. In 360, he was appointed bishop of Cyzicum. In the great controversy regarding the nature of the Trinity which raged during the 4th c., E. was conspicuous by his advocacy of the view that the Father alone was eternal and supreme; that the Son was generated of Him; and the Holy Spirit, again, of the Son. His doctrine of the Trinity is sometimes called the *anomoian* ("dissimilar"), to distinguish it, on the one hand, from the *homoiousian* ("similar"), held by the semi-Arians, and, on the other, from the *homoousian* ("identical"), held by the Athanasian or Trinitarian party. It was thus the extreme of Arianism. In defense of his peculiar views, E. is said to have shown superior ability, although his opponents also accuse him of being verbose and inflated in his style. His life was much checkered. He was banished from one place to another, until at length he obtained permission to retire to his native village, where he died in 394. His writings have entirely perished, with the exception of a fragment here and there preserved in the writings of his adversaries.

EUNOMIUS, b. Cappadocia early in the 4th c.; leader of a sect of Arians who took his name. He was bishop of Cyzicus in 360, but was afterwards deposed for heresy by the bishop of Antioch. His writings were held in high esteem by his followers, and were so much dreaded by the orthodox that more than one imperial edict was issued for their destruction. His heresy was formally condemned by the council of Constantinople.

EUNUCH. The original signification of this word (Gr. *eunuchos*, one who has charge of a bed) points to the office that this class of persons fulfilled, and still fulfill in the east—that, namely, of taking charge of the women's apartments or harems. The barbarous practice of employing castrated males as guardians of the other sex, is an accompaniment of polygamy, and is therefore chiefly met with in the east and in n. Africa. If it has appeared in countries where monogamy was the law, it was in consequence of the introduction of oriental luxury, as was the case under the Roman emperors. The practice is of great antiquity, and seems to have originated in Libya, and from that to have spread to Egypt and the east. Syria and Asia Minor were the most notorious in this respect. In Greece, it never obtained any great footing; for although Greek women were kept in seclusion, polygamy itself never prevailed. The later Romans kept eunuchs, but they were mostly imported. In the Byzantine empire, on the contrary, castration and keeping of eunuchs were very prevalent. This class played a prominent part in the court of the eastern empire, and the word E. came to be the title of an office similar to that of chamberlain. In modern times, the practice is mostly confined to Mohammedan countries, and the eunuchs are chiefly brought as slaves from the interior of Africa.

EUOMPHALUS, a large genus of fossil gasteropodous shells, characterized by its depressed and discoidal shell, with angled or coronated whorls, five-sided mouth, and very large umbilicus. The operculum was shelly, round, and multi-spiral. The genus seems related to *trochus*. It appears among the earliest tenants of the globe, and keeps its place till the triassic period. No less than eighty species have been described.

EUONYMUS. See SPINDLE TREE.

EUPATORIA (formerly *Koslov*), a thriving maritime t. of Russia, in the government of Taurida, is situated on a bay in the w. coast of the Crimea, 15 m. n.w. of Old Fort, and 38 m. n.w. of Simferopol. The town stands on the border of a monotonous pastoral steppe, and is surrounded by low hills. Seen from the sea, it presents, with its occasional minarets and its houses roofed with red tiles, a somewhat picturesque appearance. The principal building is the Tartar mosque, built by Devlet-Ghiri Khan in 1552, and reckoned the finest in the Crimea. E. exports corn, wool, and salt. Its harbor is shallow, and is sheltered only from the n. and n.e. winds. Pop. '67, 7,730, mostly Crim-Tartars and Jews, who are engaged chiefly as farmers and shepherds, and possess an immense number of oxen and sheep, and a large area of badly cultivated land.

On the 14th Sept., 1854, a portion of the Anglo-French invading army landed here, and occupied and fortified the town. It was also the scene of a battle between the Russians and Turks, 17th Feb., 1855, in which the latter were victorious.

EUPATORIUM, a genus of plants of the natural order *compositæ*, sub-order *corymbiferæ*, having small flowers (heads of flowers) in corymbs, florets all tubular and hermaphrodite, club-shaped stigmas, imbricated bracts, a naked receptacle, and a hairy pappus. The species are numerous, and mostly American. One only is British, the common HEMP AGRIMONY (*E. cannabinum*), a slightly aromatic perennial plant, growing mostly in marshy places, and on the banks of streams. The root was formerly employed as a purgative, and the plant was also used as a diuretic and as a vulnerary. —THOROUGH-WORT (*E. perfoliatum*), a species having the opposite leaves joined at the base, is very common in low grounds in North America, and is a popular medicine,

much esteemed and used in that country. It is often administered in intermittent fevers. It acts powerfully as a sudorific, and is often very beneficial in catarrh and influenza. It is also emetic and purgative, and, in small doses, tonic. The whole plant is very bitter.—Other North American species possess similar properties, and the root of one, known as GRAVEL-ROOT (*E. purpureum*), is employed as a diuretic for relief of the disease from which it derives its name.—The AYAPANA (*E. ayapana*), a half-shrubby species, native of the n. of Brazil, has a high reputation in that country as a cure for snake-bites, and has been introduced into the East Indies. It is a very powerful sudorific, and is also diuretic.—The famous Peruvian vulnerary, MATICO, has been referred, but uncertainly, to a shrubby species of this genus, *E. glutinosum*.—GUACO or HUACO, much valued in Peru as a cure for snake-bites, is supposed to belong to the allied genus *mikania*.

EU'PEN, a flourishing manufacturing t. of Rhenish Prussia, is situated in a beautiful valley on the Weeze, within 2 m. of the Belgian frontier, and 9 m. s.s.w. of Aix-la-Chapelle. It is well built and open, including within its limits several gardens and meadows. There are four churches in the town—three Roman Catholic and one Protestant, also a convent, a high-school, and an orphan-house. E. has the most flourishing woolen manufactures of any town in Prussia, and has also dye-works, machine-making, and other manufactures. It owes the prosperity of its manufactures chiefly to a number of French refugees, who settled here after the peace of Lunéville. Pop. '75, 14,895.

EU'PHEMISM (Gr. *eu*, well, and *phemi*, I speak) is a figure of rhetoric by which an unpleasant or offensive matter is designated in indirect and milder terms. Thus, instead of directly calling up an unpleasant image by the word *died*, we say, "he was gathered to his fathers." The ancients used a multitude of euphemisms, to avoid words that were thought to be ominous of evil, or offensive to the unseen powers. They spoke, for example, of the Eumenides, or "benign goddesses," instead of the Furies; just as the elves and fairies of modern superstition are spoken of as "good neighbors."

EU'PHON, or EU'PHONON, a musical instrument invented by Chladni in 1790. It is similar in tone to the harmonica, and, like it, the tone is produced from the sounding body by the finger direct, without mechanism, and is regulated in quality and effect by the taste and feelings of the performer, who can produce tones from the most delicate pianissimo to fortissimo. In 1822, Chladni exhibited an improved E. of which a detailed description is given by himself in the Leipsic *Musik-zeitung* of that year, p. 805.

EUPHORBIA, OIL OF, or OIL OF CAPER SPURGE, an extremely acrid fixed oil, obtained by expression, or by the aid of alcohol or ether, from the seeds of the caper spurge (*euphorbia lathyris*), a plant common in many parts of Europe, and naturalized in some places in Britain. See SPURGE. Oil of euphorbia has much resemblance to croton oil in its properties, although less powerful, and is sometimes used as a substitute for it, in doses of from three to ten drops. It is good for use only when recently extracted.

EUPHORBIA'CEÆ, a very extensive natural order of exogenous plants, containing upwards of 2,500 known species—trees, shrubs, and herbaceous plants. They abound chiefly in warm countries, and most of all in tropical America. The few species found in the colder parts of the world are all herbaceous. The common box reaches a more northern limit than any other shrubby species. The other British species are different kinds of spurge (*euphorbia*) and dog's mercury (*mercurialis*). The E. usually abound in an acrid and poisonous milky juice; although there are species of which the juice is bland or becomes bland through the application of heat, so that their leaves may be used as food. The leaves in this order exhibit great diversities. The inflorescence is also various. Amongst those most remarkable for the acridity of their juice are the MANCHINEEL (q.v.) and *excœcaria agallocha*, an East Indian tree—formerly supposed to yield one of the kinds of aloes-wood—the smoke from the burning of which is extremely dangerous to the eyes. The juice of many of the spurges is also very acrid. Many of the E. are valued for their medicinal properties, different parts of the plant being in some instances employed, and in some the resins and oils which they yield. Thus the juice of some of the spurges, the roots or bark of the roots of others, the bark of different species of *croton* (cascarilla bark, copalche bark), etc., are used in medicine; and to plants of this order we are indebted for euphorbium, oil of euphorbia, castor oil, croton oil, etc. A few of the E. yield balsamic products of exquisite fragrance (see CROTON); a few, although their juice is poisonous, yield a wholesome starch in considerable abundance (see MANIOC); a few are cultivated and used as pot-herbs, particularly species of *plukenetia* in the East Indies; a few yield wholesome and agreeable sub-acid fruits, as *cicca disticha* and *C. racemosa* in the East Indies; the seeds of some are eatable, as those of the candle-nut (q.v.), of *omphalea diandra*, a Jamaica tree, and of *conceveiba Guianensis*, the latter being esteemed particularly delicious; the oil of the seeds is also in some cases used for food, like other bland oils (see CANDLE-NUT); but more frequently it is used for burning, as castor oil, candle-nut oil, the oil of *elæococca verrucosa* in Japan and Mauritius, and the concrete oil of *stillingia sebifera*, which is used in China for making candles, and in medical preparations as a substitute for lard.

—The dye-stuff called Turnsole (q.v.) is obtained from a plant of this order; and a bright red is imparted to silk by the roots of *rottlera tinctoria*, a native of Circassia, and by a red powder with which its seed-vessels are covered. The timber of some of the E. is valuable. African teak (q.v.) belongs to this order. The red-colored wood of *stylodiscus trifoliatus* is used in Java for making masts. Some of the E. are often cultivated in gardens and hot-houses, more frequently for their curious appearance than for their beauty; but the large deep crimson bracts of *poinsettia pulcherrima*, a native of Madagascar, make it a very attractive plant.

EUPHORBIUM, an extremely acrid gum resin, obtained from several species of *euphorbia* or Spurge (q.v.), as *E. officinarum* and *E. antiquorum*, in the n. of Africa, Arabia, and the East Indies, and *E. canariensis* in the Canary islands. It is obtained by incisions in the branches, whence issues a corrosive milky juice, which dries in the sun, and becomes a yellowish-gray waxy gum resin. The persons who collect it are obliged to defend their mouths and nostrils by a cloth, as its particles produce incessant sneezing, violent inflammation of the nostrils, and a very painful burning sensation in the mouth. On account of its excessive acridity, it is now less used in medicine than formerly; although it is still occasionally mixed with burgundy pitch or other substances to make rubifacient plasters for chronic affections of the joints; its alcoholic tincture is used as a caustic in carious ulcers, and its powder, mixed with much starch or flour, as an *errhine* in chronic affections of the eyes, ears, or brain. It was formerly administered as an emetic and drastic purgative, but is dangerously violent in its action.

EUPHRA'NOR, a sculptor and painter of Greece in the 4th c. B.C. One of his finest works in sculpture was a figure of Paris, a copy of which is in the Vatican. His chief painting was extant at the time of Pausanias. It represented on one wall of a temple the twelve gods, and on the other wall Theseus as the founder of the equal polity of Athens.

EUPHRASIA. See EYEBRIGHT.

EUPHRATES (in the oriental languages, *Frat*, *Phrat*, or *Forat*) is the largest river in western Asia, and, with the Tigris, forms the most important river-system of that quarter of the world. It has its source in the heart of Armenia in two branches—the Kara Su and the Murad, of which the former rises 25 m. n.e. of the town of Erzerum, and flows s.w. to a point 10 m. n. of Keban' Ma'den, where it is met by the Murad, which rises on the southern slope of Alá Tagh, and flows w.s.w. to the point of confluence. From Keban' Ma'den, the E. flows in a general southern direction, with a tendency, however, to struggle westward towards the Mediterranean. In this part of its course, it breaks through the Taurus, and flows among the mountains for 45 m., emerging at Sumeisat, whence it continues navigable to the sea—a distance of 1195 m.—and passing Bir, at which point it is 628 ft. above the level of the Mediterranean, and 100 m. distant from its nearest shore. After passing Samosta, it changes its direction, and flowing s., separates for a considerable distance Mesopotamia from Syria and the deserts of Syrian Arabia. Curving to the s.e., it flows on without receiving almost any tributaries for about 700 m., until it is joined at Kurnah or Kornah by the waters of the Tigris. From Kurnah, the river, taking the name of the Shatt-el-Arab, continues to flow in a s.e. direction, until, after being united by a canal with the Karun from the mountains of Persia, it empties itself, by several arms, into the Persian gulf, 90 m. below Kurnah. The total length of the E. is 1600 m.; the area drained by all the waters which enter the Persian gulf by the Shatt-el-Arab, is 108,000 m.; and the volume of water discharged by it is 401,010 cubic ft. per second, or 72,910 cubic ft. more than that discharged by the Danube in the same time. The average width of the Shatt-el-Arab is upwards of 600 ft.; it is navigable in mid-stream for vessels of 500 tons.

The water of the E., although muddy, is not unwholesome. Its inundations, caused by the melting of the snows, take place chiefly from the beginning of Mar. till the end of May; and in ancient times, when canals and embankments regulated these inundations, exercised the same beneficial effect on the country as those of the Nile on Egypt. See BABYLONIA.

EUPHROSYNE (i.e., the joyous one), one of the Graces (q.v.).

EUPHUISM (Gr. *euphues*, of vigorous growth; eloquent), a term used in English literature to denote an affected and bombastic style of language, fashionable for a short period at the court of queen Elizabeth. The word was formed from the title of the book which brought the style into vogue, the *Euphues* of John Lyly (q.v.).

EUPIONE (Gr. *eu*, good, and *pion*, oil) is an extremely mobile oil, obtained from the lighter portions of the liquid products of the destructive distillation of wood (wood-tar), coal (coal-tar), and animal matter, and in the distillation of rape-seed oil. It may be obtained in a sufficient state of purity by acting upon the crude tars and oils by concentrated sulphuric acid, or a mixture of sulphuric acid and niter, which removes the majority of the other ingredients; and on the distillation of the portion which resisted the action of the acid, the first part which passes over is the eupione. When pure, it has the composition C_6H_6, and is therefore a hydro-carbon. It is the lightest liquid known, having the density of 655 (water = 1000), and is thin, colorless, and tasteless, while it possesses a pleasant aromatic odor. It boils at 116° F., and distils readily;

whilst, when set fire to, it is very inflammable, burning with a white flame of considerable luminosity and penetrating power. It makes a greasy stain on paper, is insoluble in water, very slightly soluble in alcohol, but readily miscible with ethers and oils in general.

EU'PODA, a family of coleopterous insects of the tetramerous section of the order, deriving their name (Gr. well-footed) from the great size of the hinder thighs of many of the species. They feed on the stems and leaves of plants, some of them on aquatic plants, the roots of which afford food to their larvæ. The body is oblong; the antennæ filiform. Some of the E. are among the most splendid of tropical insects. Britain produces a number of small species.

EU'POLIS, b. 445 B.C.; an Athenian poet of the old comedy, ranking, in the opinion of Horace, with Cratinus and Aristophanes. It is said that he was thrown into the sea by Alcibiades, who had suffered from his sarcasm; but, according to another account, he fell in either the battle at Cynossema, 411 B.C., or that of Ægospotami, 408 B.C. He was sufficiently great to have a quarrel with Aristophanes on mutual charges of plagiarism.

EUPOMPUS, a Greek painter of the 4th c. B.C., contemporaneous with Zeuxis and Parrhassius. When the sculptor Lysippus asked him whom he should take for his model, Eupompus replied, "Take nature herself for your model, and be not shackled by the trammels of any predecessor."

EURA'SIAN, from Eur (Europe) and Asia; a half-breed, offspring of an Asiatic mother and European or American father. This class is very numerous in the large cities of India, and at the ports open to foreign commerce in Burmah, Siam, China, and Japan. In India, they number 100,000. In person, they are usually handsome, well-formed, and, as a rule, learn the language of their fathers; but are not well esteemed by either natives or foreigners. By the laws of Japan and of Great Britain, the sons are citizens with their fathers, the daughters with their mothers.

EURE, a river of the n.w. of France, and a tributary of the Seine, rises in the department of Orne, flows first s.e. into the center of the department of Eure-et-Loir, then n. and n.w. through the departments of Eure-et-Loir and Eure, and joins the Seine on the left above Pont-de-l'Arche, after a course of about 100 miles. Only that portion of the E. which is in the department of Eure is navigable.

EURE, a department in the n.w. of France, immediately s. of the department of Seine Inférieure, contains an area of 2,290 sq. miles. Pop. in '76, 373,629. Its surface is unusually level, as the highest eminences in the department are not more than 300 ft. in height. The principal river is the Seine, which entering the department from the s.e., flows through it in a n.w. direction to Pont-de-l'Arche, below which the course of this river is in the department of Seine Inférieure. The Eure, from which this department derives its name, and the Rille, both affluents to the Seine, are the only other important rivers. The climate is mild, moist, and foggy. Great part of the level country is covered with a loamy alluvial soil upon a stratum of limestone; while the remainder is composed of chalk, flint, and tufa. Along the Seine, the soil is in some parts sandy, stony, and barren, but the greater part is very fertile. The chief natural products are corn, hemp, flax, vegetables, and fruit, particularly apples and pears, from which large quantities of cider and perry are made. The breeding of cattle, horses, and sheep, is favored by extensive meadows and pasture-lands. Iron is found in considerable quantities. There are extensive iron and copper works and pin manufactories. Cotton goods, cloth, linen, paper, glass, and stoneware are likewise manufactured. The department of Eure is divided into five arrondissements—Evreux, Louviers, Les Andelys, Bernay, and Pont-Audemer. The capital is Evreux (q.v.).

EURE-ET-LOIR, a department of France, formed chiefly from the province of Orléannais, extends between lat. 47° 57′ and 48° 55′ n., and long. 0° 47′ and 2° east. Area, 4,260 sq. miles. Pop. '76, 283,075. It is watered mainly by the Eure in the n., and the Loir in the s., the two rivers from which it takes its name. This department lies on the water-shed between the bay of Biscay and the English channel. It is in general level, the e. and s. being occupied by high and extensive flats; while in the w. the scenery is finely varied by hill and valley. The soil is fertile, and, especially towards the e. and s., is admirably adapted for wheat. Hops grow spontaneously in some quarters. In the forests, the oak and birch are the prevailing trees. The rivers, none of which are navigable in this department, furnish valuable water-power for the numerous mills of various kinds that are situated on their banks. Iron is the only mineral found and worked to any great extent; but the chief articles of trade are corn, flour, and wool. The department is divided into the four arrondissements of Chartres, Château-Dun, Dreux, and Nogent-le-Rotrou, with the town of Chartres for capital.

EURE'KA (Gr.), "I have found it." An exclamation attributed to Archimedes, the famous philosopher of Syracuse. Hiero the king sent a quantity of gold to a jeweler to be made into a crown. He suspected that the man had taken some of the gold and supplied its place with alloy. Therefore he asked Archimedes to test the work and determine the truth. The philosopher was just then stepping into his bath, and as he did so the water overflowed. The fact struck his mind that the water was displaced in ratio with

the bulk of the object immersed, and suggested to his mind that, as a pound of gold was much smaller than a pound of silver, the trial of the crown in water would be a sure test. Convinced of the fact, he jumped from the bath, shouting "Heureka! Heureka!" and, without waiting to dress, ran home to prove the truth of his discovery.

EURIPIDĒS, the latest of the three great Greek tragedians, was b. at Salamis, 480 B.C., on the very day (23d Sept.), it is said, of the glorious victory gained by the Greeks over the Persians near that island. The Arundel Marble, however, gives as the date of his birth 485 B.C., while Müller, following Eratosthenes, makes it four years later. His education was very good. At first, he was trained to gymnastic exercises (in consequence of the prediction of an oracle that he should be crowned with "sacred garlands"); he next turned his attention to painting; then studied philosophy under Anaxagoras, and rhetoric under Prodicus, and formed a lasting friendship with Socrates. The first play of E.'s which was performed was the *Peliades* (456 B.C.). In 441 B.C., he gained the first prize for tragedy, and continued to write for the Athenian stage until 408 B.C., when he accepted an invitation to the court of Archelaus, king of Macedonia. Scandal has invented other reasons for E.'s leaving Athens, but they are unworthy of notice. He is said to have been killed (406 B.C.) by dogs, which were set upon him by two brother-poets who envied him his reputation. In E.'s time, Greek tragedy had been brought to its highest perfection by Sophocles, who was 15 years older than Euripides. The latter, however, was the second favorite author of his time; nay, on more than one occasion, his tragedies were preferred to those of Sophocles; but his liberal and even neologistic tendencies in regard to religion, excited the hostility of that witty but scurrilous champion of Greek orthodoxy, Aristophanes, who frequently ridiculed E. in cutting parodies. There can be no doubt that E. was systematically abused by the Athenian tory party, of whom Aristophanes was the literary chief, and to whose unscrupulous opposition it was owing that he gained the prize only five times out of 75 competitions. But against the censure of Aristophanes may be set the praise of two much greater men—Aristotle and John Milton. E.'s plays are reckoned by some to have amounted to 75, by others to 92. Only 18 have come down to us. These are *Alcestis* (438 B.C.), *Medea* (431 B.C.), *Hippolytus* (428 B.C.), *Hecuba* (424 B.C.), *Heracleidæ* (421 B.C. ?), *Supplices* (421 B.C. ?), *Ion* (date not ascertainable), *Hercules Furens* (date not ascertainable), *Andromache* (420–17 B.C.), *Troades* (415 B.C.), *Electra* (415–13 B.C.), *Helena* (412 B.C.), *Iphigeneia in Tauris* (date uncertain), *Orestes* (408 B.C.), *Phœnissæ* (probably same year), *Bacchæ* (probably written in Macedonia), *Iphigeneia in Aulis* (posthumously represented in Athens); and finally, *Cyclops* (uncertain). *Rhesus*, attributed to E., is probably not genuine. Concerning E. and his tragedies, A. W. Schlegel remarks: "Of few authors can so much good and evil be predicated with equal truth. He was a man of infinite talent, skilled in the most varied intellectual arts; but although abounding in brilliant and amiable qualities, he wanted the sublime earnestness and artistic skill which we admire in Æschylus and Sophocles. He aspires only to please, no matter by what means. For this reason, he is so frequently unequal to himself; producing at times passages of exquisite beauty, and frequently sinking into positive vulgarity." The main object of E. was to excite emotion, and his works laid open a totally new world (in literature), that of the heart, which, beyond dispute, contributed much to their popularity. On the other hand, his inartistic and careless plots compelling him to a constant use of the *Deus ex machinâ* solution of difficulties, and occasionally even the subjects of his art themselves, leave ample room for criticism. Archelaus refused to allow his bones to be removed to Athens, and erected a splendid monument to him in Pella, with the inscription: "Never, O Euripides, will thy memory be forgotten!" Still more honorable was the inscription on the cenotaph erected to him by the Athenians on the way to the Piræus: "All Greece is the monument of Euripides; Macedonian earth covers but his bones." Sophocles, who survived him, publicly lamented his loss; and the orator Lycurgus afterwards erected a statue to him in the theater at Athens. The *editio princeps of E.* appeared, it is thought, at Florence, toward the end of the 15th century. The best modern editions are those of Beck (Leip. 1778–88), Matthiae (Leip. 1813–29), Kirchhoff (1855), and Nauck (1871). An English translation in verse, by Potter, appeared at Oxford in 1814.

EURIPUS, the channel between the island of Eubœa and the coast of Greece. Opposite Chalcis it is but a little over 60 yards wide and 7 or 8 ft. deep. There is a rock in the channel, on which stands a castle connected with both shores by bridges. This double bridge is said to have been built originally as early as the 4th c. B.C.

EUROCLYDON, the name given to a wind which caught the ship in which Paul undertook his voyage to Rome. Biblical scholars are not entirely agreed as to the term and its meaning; but it is evident that it was a n.e. wind, or e.n.e., with variable and fierce gusts from various points—similar to our *northeasters*. It was probably one of those violent gales now called *levanters*.

EURO'PA, in Greek mythology, a daughter of Agenor or of Phœnix. Her beauty attracted the attention of Zeus, who appeared in the form of a white bull, and carried her to Crete, where she became the mother of Minos, Rhadamanthus, and Sarpedon. Her brother Cadmus, strictly charged not to return without her, set out with their mother (Telephassa) to find her. The mother died in Thessaly. At Delphi, Cadmus

learned that he must follow a cow, which would guide him to the place where he must build a city. The cow lay down on the site of Thebes; but before he could offer the animal as a sacrifice to Athene he had to fight with a dragon which haunted a well. He conquered the dragon, and sowed its teeth over the ground. From the teeth sprang armed men who slew each other until only five were left to become the progenitors of the Thebans. Athene made Cadmus king of Thebes, and Zeus gave him Harmonia as his bride. The fate of Europa is not further recorded, but her name still lives in the designation of the continent of Europe.

EUROPE, the smallest, but also the most highly civilized and most populous of the three great divisions of the old continent. It is separated from America on the w. and n.w. by the Atlantic; from Africa on the s. by the Mediterranean; and from Asia by the archipelago, sea of Marmora, Black sea, Caucasian ridge, Caspian sea, Ural river and mountains, and the Kara river. It is in the form of a huge peninsula, projecting from the n.w. of Asia. Its extent from cape St. Vincent on the s.w. to the mouth of the Kara river on the n.e. is 3,400 m.; and from cape Nordkun, the most northerly point of the Scandinavian mainland, to cape Matapan, the southmost point of Greece, 2,400 miles. The continent of E., irrespective of islands, lies within lat. 36° 1′ to 71° 6′ n., and long. 9° 30′ w. to 68° 30′ east. Its area is estimated at rather more than 3,720,000 sq.m.; and its coast-line, more extensive in proportion to its size than that of any other great natural division of the globe, is estimated at 19,500 m.; giving a proportion of 1 linear m. of coast for every 190 sq.m. of surface. It has a pop. of 299,000,000, which gives an average of about 80 for every sq. mile.

The body of the European continent divides itself naturally into two great portions —the great plain in the n.e., and the highlands in the s.w., the mountainous peninsula of Scandinavia, lying, as it were, apart from either, being to some extent exceptional. The plain occupies about two thirds (2,500,000 sq.m.) of the entire extent of the continent. It reaches from the eastern boundary of E., n. to the shores of the Arctic ocean, s. to mount Caucasus and the Black sea, and westward over the whole extent of the continent; gradually, however, becoming narrower in its progress west. In shape, this plain resembles a triangle; its base rests on the eastern boundary, and it may be said to reach its apex on the shores of Holland. It separates the two mountain systems of E.—the Scandinavian system (see SCANDINAVIA) on the n., and on the s. the system of southern Europe. See ALPS, APENNINES, BALKAN, CARPATHIAN MOUNTAINS, CEVENNES, PYRENEES, etc.

Jutting out in numerous peninsulas, and indented by extensive bays and gulfs, E. has no town at a much greater distance from the sea than 400 m., save those in the center of the eastern plain; but even here, by means of numberless rivers and the canals, which, from the nature of the country, are easily constructed and maintained, a splendid system of communication by water now exists. See VOLGA, DÜNA, DNIEPER, NIEMEN, etc. Also RUSSIA.

As the details of the geography of E. are given under the names of its several political divisions, and of its lakes, rivers, etc., little falls to be said under the present head. On the opposite page, however, is a table of the countries of E., with their extent, etc.

Geology.—The geology of E is most conveniently considered under the different countries. See also ALPS, PYRENEES, etc.

Natural History.—The natural history of E. very much agrees with that of the corresponding latitudes of Asia. The natural history of the European countries on the Mediterranean sea is very similar to that of Syria and of Asia Minor. The natural history of the more northern regions of E. resembles that of the great plains of Central Asia and Siberia. The most northern regions have the strictly arctic flora and fauna common in a great measure to all the arctic and subarctic regions; whilst the natural history of the most southern countries assumes a subtropical character. The European countries near the Mediterranean produce fewer of the shrubby and odoriferous *labiatæ* than the Caucasus and adjoining regions, whilst the *caryophyllaceæ* are more abundant. The extreme abundance of *cistaceæ* is a peculiar feature of the flora of Spain and Portugal. The *primulaceæ* are particularly plentiful in all the alpine regions of the s. of E., but this characteristic is in some measure shared by the Himalaya. In no other part of the world do umbelliferous and cruciferous plants plants form so large a proportion of the flora as in Europe.

The temperature of the western and northern parts of E. being raised by the gulf-stream and the winds from the great mass of dry and desert land in Africa above what is elsewhere found in similar latitudes, the flora and fauna exhibit a corresponding character, affected, however, by the great amount of moisture derived from the Atlantic ocean; and also to a still greater degree by the comparative uniformity of temperature which the proximity of the ocean produces. The effect of the last-mentioned causes is so great, that the northern limit of some plants is sooner reached on the shores of the Atlantic than in the more central parts of E., where the winters are much colder, and the average temperature of the year is lower. Of this the vine and maize are notable examples. Plants which require a mild winter will not grow in the n.—and scarcely even in the center of E.—but they advance along the western coast under the influence of the maritime climate. Thus the myrtle—although not indigenous—grows even in the

s. of England, Amongst plants, the date palm, and amongst animals a species of ape, are found in the s. of E. (the ape only on the rock of Gibraltar); whilst some strictly African birds are frequent visitants, and many birds—as the cuckoo, swallow, etc.—are common to E. and Africa, inhabitants in summer even of very northern regions, and returning in winter to the warm south.

*STATES.	FORM OF GOVERNMENT.	Ext. in Eng. sq.m.	Population.	No. inh. per Eng. sq.m.
Andorra	Republic, with a sovereign council	155	12,000	77
Austro-Hungarian Monarchy	Limited monarchy, two chambers	238,000	35,904,435	150
Belgium	Limited monarchy, two chambers	11,300	5,087,105	450
Britain, Great, and Ireland	Limited monarchy, two houses of parliament	121,600	31,857,398	261
Denmark	Limited monarchy, two chambers	14,500	1,822,402	125
France	Republic (1875), one chamber	201,000	36,102,921	179
German Empire	Limited monarchy, two chambers	(208,613	(41,060,695)	196
Prussia (with Lauenburg)	Limited monarchy, two chambers	134,281	24,656,078	183
Alsace-Lorraine	Crownland (Reichsland)	5,590	1,549,587	277
Anhalt	Duchy, limited sovereignty, one chamber	896	208,497	227
Baden	Grand duchy, limited sovereignty, two chambers	5,850	1,461,562	249
Bavaria	Limited monarchy, two chambers	29,280	4,852,026	165
Bremen	Free city, senate and burgher assembly	97	122,402	1,261
Brunswick	Duchy, limited sovereignty, one chamber	1,425	311,764	218
Hamburg	Free city, senate and burgher assembly	158	338,974	2,145

Sweden and Norway	Limited monarchy, two chambers for each country	288,600	5,950,775	20
Switzerland	Republican confederation, federal diet	15,800	2,669,147	169
Turkey (in Europe)	Absolute sovereignty	132,350	10,510,000	79
	Total	3,733,008	391,256,303	

* These statistics are necessarily founded on data obtained prior to the changes made in 1878 in the Balkan peninsula, and the constitution of the principality of Bulgaria (q.v.).

Of the plants now most commonly associated in our thoughts with the southern countries of E., many have probably been introduced from Africa, or from the east. This has probably been the case even with the myrtle, and certainly has been the case with the vine, the olive, the orange, lemon, etc., the fig, the peach, the almond, the apricot, etc. Some of the most extensively cultivated fruits are certainly indigenous to E., as the apple, pear, plum, and cherry, although even of these the first improved varieties may have been introduced from the earlier seats of civilization in the east. Among the wild animals of E. at the present day, the aurochs or bison is still reckoned; and the ox existed at no very remote period in a truly wild state. The reindeer

inhabits the extreme n. of E.; the elk, the stag, the fallow-deer, and the roebuck, are found in more southern nations; the ibex or bouquetin exists on the high central mountains; two species of antelope—the chamois of the Alps, and the saiga of the Russian plains—connect the European fauna with the Asiatic and African. Of carnivorous animals, the most worthy of notice are the bear, the wolf, the fox, and the lynx.

The abundance of lakes and streams in the northern parts of E. is accompanied with a corresponding abundance of water-fowl (*anatidæ*) and of fish. Of the latter, the *salmonidæ* are the most valuable, and the *cyprinidæ* next to them. The European seas afford valuable fisheries, particularly of herring and of cod in the n., and of tunny, anchovy, etc., in the Mediterranean.

The common hive bee and the Ligurian bee may probably be regarded as natives of Europe. The silk-worm was introduced from the east. Another valuable insect, the cochineal insect, was introduced from America; but the *cantharis*, or blistering fly, is truly indigenous to the s. of Europe.

EURO'TAS, a river of Greece now called the Vasiliko, rising in the Arcadian mountains and falling into the gulf of Laconia. The cities of Sparta and Amyclæ were on this river, which was one of the streams to which the ancient Greeks paid divine honors.

EURY'ALE, a genus of plants of the natural order *nymphæaceæ*, or water-lilies, closely allied to Victoria (q.v.), although of very different appearance. *E. ferox* is a water-lily with small red or violet-colored flowers, leaves about a foot in diameter, the leaf-stalks and calyces covered with stiff prickles; a native of India and China. The fruit is round, soft, pulpy, and of the size of a small orange, composed of a number of carpels, and containing round black seeds as large as peas, which are full of a nutritious agreeable farina, and are eaten roasted. The root-stock also contains starch, which may be separated and used for food; and the root itself is eaten. The plant is said to have been in cultivation in China for upwards of 3,000 years.

EURYD'ICE, the wife of Orpheus. She died from the sting of a serpent, and her husband followed her into hades, where he so charmed Pluto with the music of his lyre that he was permitted to take Eurydice back to earth on condition that while on his way he would not look behind him. Just as they were near the entrance Orpheus could no longer refrain from casting a backward glance, which showed him Eurydice rapidly receding to the regions of the dead.

EUSE'BIUS, of Cæsarea, the father of ecclesiastical history, was b. in Palestine, about 264 A.D. He took the surname of Pamphili from his friend Pamphilus, bishop of Cæsarea, whom he faithfully attended for the two years (307–309) in which he suffered imprisonment during the persecution of Diocletian. He then went to Tyre, and afterwards to Egypt, where he himself was thrown into prison on account of his religion. In 315, he succeeded Agapius as bishop of Cæsarea, took a prominent part at the council of Nice in 327, and died about 340.—E. was the head of the semi-Arian or moderate party in the council of Nice. That party were averse to discussing the nature of the Trinity, and would have preferred the simplicity of Scripture language in speaking about the Godhead to the metaphysical distinctions of either side. They regarded Trinitarianism, on the one hand, as logically indefensible, but, on the other, they recognized the fact, that Scripture sometimes spoke of the Son in terms not compatible with the views of Arius, and therefore they wished each man to enjoy the utmost freedom in his interpretation of Scripture on this point. E. thought that the great thing was to lay to heart the truth, that "God so loved the world that he gave his only begotten Son, that whosoever believeth on him should not perish, but have everlasting life." The promise is to him that *believeth on him*, not, he argues, to him that *knows how he is generated from the Father*. He was very reluctant to accept the term *homoousios* (of the same substance), devised by Athanasius to describe the equality of the Son with the Father, and retained the kindliest feelings towards Arius after the views of the latter were condemned. His moderation and other excellent qualities procured him the favor of Constantine, who declared that he was fit to be the bishop of almost the whole world. E. has the reputation of being the most learned Father of the church after Origen. His chief works are—1. The *Chronicon*, a history of the world down to the celebration of Constantine's *Vicennalia* at Nicomedeia and Rome, 327 and 328 A.D. It is valuable as containing extracts from such writers as Berosus, Sanchoniathon, Polyhistor, Cephalion, and Manetho. It was first published in a complete state by Mai and Zohrab, at Milan, in 1818, from an Armenian MS. version discovered at Constantinople. 2. The *Præparatio Evangelica*, in 15 books, a collection of such statements in old heathen authors as were fitted to make the mind regard the evidences of Christianity in a favorable light. It was translated into Latin, and appeared at Treviso in 1480. The Greek text was first published at Paris in 1544. 3. *Demonstratio Evangelica*, in 20 books, a work intended to convince the Jews of the truth of Christianity from the evidence of their own Scriptures. A Latin version of this was printed as early as 1498; the Greek original did not appear till 1544, when it was published along with the *Præparatio* at Paris, by R. Stephens. 4. The *Ecclesiastical History*, in 10 books. This relates the principal occurrences which took place in the Christian church till the year 324,

and contains the results of his studies in numerous libraries, and even in the imperial archives, the emperor Constantine having ordered, at E.'s request, an examination of all documents relative to the history of martyrs. One drawback of the work is that E., on principle, withholds all account of the wickedness and dissensions of Christians, inasmuch as he did not consider such stories for the edification of the church. A Latin translation of the work by Rufinus was published at Rome in 1474; the Greek text at Paris in 1549, and at Geneva in 1612. Among the more recent editions are those of Heinichen (Leib. 1827) and Burton (Oxford, 1838). The *Ecclesiastical History* has been translated into English, German, French, etc. Besides the foregoing works, may be mentioned the *De Martyribus Palestinæ*, a book against Hierocles; another against Marcellus; and a *Life of Constantine*. The first edition of all E.'s works appeared at Basel in 1542.

EUSE'BIUS, of Emisa, was b. at Edessa, studied at Alexandria, and was the pupil of Eusebius Pamphili, and the friend of Eusebius of Nicomedeia. Averse to all theological controversies, he declined the bishopric of Alexandria, vacant by the deposition of Athanasius. He was afterwards, however, appointed bishop of Emisa, but during his ordination, a Christian mob, accusing him of "mathematics" and magic, created a tumult, and obliged him to flee for his life. Subsequently, he returned to Emisa, where he was "tolerated" in spite of his dangerous knowledge. He died at Antioch in 360. The emperor Constantius was much attached to E., and used to take him with him on his military expeditions. E. was accused of Sabellianism (q.v.), and Jerome calls him "the ringleader of the Arian party." Jerome, however, was rash in his epithets, and it is more probable that he belonged to the party of his namesake of Cæsarea, the semi-Arians, or peace-party, who wished the doctrine of the Godhead expressed in the language of Scripture, and not of theology. The homilies extant under his name have been published by Augusti (Elberf. 1829). The genuine ones display great eloquence. Other writings by him, as, for example, the *Quæstiones XX. Evangelicæ*, and part of the *Commentarius in Lucam*, were published by Mai, in the *Scriptorum Veterum Nova Collectio* (vol. i., Rome, 1825). See Thilo, *Ueber die Schriften des E. von Emisa* (Halle, 1832).

EUSE'BIUS, of Nicomedia, Patriarch of Constantinople, b. towards the end of the 3d c., was first tutor to the emperor Julian, to whom he was related by the mother's side; then bishop of Beryta (Beyrout), in Syria, and afterwards of Nicomedia. In order to secure his position, he appeared as the defender of Arius at the council of Nice, and afterwards placed himself at the head of the Arian party. Under the emperor Constantine, whom he baptized in 337, he became patriarch of Constantinople. He died in the year 342, after having, in the previous year, held an assembly of the church for the establishment of Arianism at Antioch. It is not easy to get at his real character. We have no ecclesiastical works by Arian writers, our only sources of information as regards the character and opinions of that party being their enemies—the orthodox party; yet, making the ordinary allowance for partisanship, there would seem to be sufficient reason for concluding that E. was cunning and double-tongued when occasion required, and imperious and violent when he had power in his hands. Athanasius considered him not the disciple, but rather the teacher of Arius. From him the Arians are sometimes styled Eusebians. See Neander, *Kirchengeschichte*, vol. ii. p. 773, etc.

EUSTACHIAN TUBE. See EAR.

EUSTACHIAN VALVE. See FŒTUS.

EUSTACH'IUS, BARTOLOMMEO, an Italian anatomist, who was b. in the early part of the 16th c., and died in 1574. Few particulars are known regarding his life, but we learn from the introduction to one of his works, that in 1562 he was professor of medicine in the Collegio della Sapienza at Rome. His name is indelibly associated with anatomical science, through his discoveries of the tube in the auditory apparatus, and the valvular structure in the heart, which have been called after him. He was the first to give an accurate description of the thoracic duct, and was probably the first to notice and describe the stapes (one of the chain of small bones crossing the tympanic cavity of the ear), a discovery which, however, Fallopius assigns to Ingrassias. He likewise contributed materially to the diffusion of more accurate knowledge regarding the development and evolution of the teeth, and the structure of the kidney. These discoveries are recorded in his *Opuscula Anatomica*, published at Venice in 1563. He was the first anatomical writer who illustrated his works with good engravings on copper. The *Tabulæ Anatomicæ*, which he was probably unable to publish in consequence of the poverty of which he complains in the introduction to which we have already referred, did not appear until 1714, when they were edited, with explanatory remarks, by Lancisi. Their value is sufficiently evidenced by the fact, that Albinus published a new edition, with an excellent Latin commentary, in 1743, at Leyden; that Bonn published a Dutch edition in 1798 at Amsterdam; and that a German edition appeared in 1800. Lauth, in his *History of Anatomical Discovery*, remarks that if the *Tabulæ* had appeared in E.'s lifetime, anatomy would have attained the perfection of the 18th c. nearly 200 years earlier. E., Vesalius, and Fallopius may be regarded as the three great founders of modern anatomy.

EUSTA'THIUS, the celebrated Greek commentator on Homer and the geographer Dionysius, was born at Constantinople. He was at first a monk, then a deacon and teacher of rhetoric in his native city, and, in the year 1155, was appointed archbishop of Thessalonica, where he died in 1198. E. was profoundly versed in the ancient classic authors, and a man of prodigious acquirements, as is proved by his commentaries. The number of authors whom he quotes is almost incredible, and the value of his quotations is heightened by the consideration, that most of the works from which he extracts are no longer extant. His most important work is his *Commentary on the Iliad and Odyssey of Homer.* The first edition appeared at Rome 1542–50; the last at Leip. 1825–29. The work is open to objection on the score of method, and is diffuse and digressive, but it is nevertheless a vast mine of knowledge for students of Homer. Of a similar character is E.'s *Commentary on Dionysius,* first printed by Stephens (Paris, 1547), and lastly in Bernhardy's edition of Dionysius (Leip. 1828). Of his commentary on the hymns of Pindar, only the *Proœmium* has come down to us. It was first published by Tafel in 1832, along with E.'s theological treatises and letters.

EUSTA'THIUS, SAINT, a native of Pamphylia; bishop of Berœa, and in 325 A.D. patriarch of Antioch. He was a zealous opponent of the Arians, who contrived to have him deposed on charges of heresy and unfaithfulness to the vows of celibacy. He was banished to Thrace, where he died about 360 A.D.

EUSTA'TIUS, ST., one of the Dutch West India islands, lies near the n.e. bend of the great arch of the Antilles, about 12 m. to the n.w. of St. Christopher. Lat. 17° 31′ n., and long. 63° 5′ west. Area, 8 sq. miles. St. E. is a pyramidal rock, of volcanic formation, showing two extinct craters, and being still subject to earthquakes. Hurricanes also of intense severity occur, more particularly in Aug. and Sept. Along its entire circuit of 29 m., St. E. has only one landing-place, which, besides being difficult of access, is strongly fortified. The whole mountain is fertile, producing in abundance not merely commercial crops, such as sugar, cotton, and tobacco, but also provisions of various kinds, such as maize, hogs, goats, and poultry. Pop. about 2,000.

EUSTIS, WILLIAM, LL.D., 1753–1825; b. Mass.; a graduate of Harvard; studied medicine under Dr. Joseph Warren; served as a surgeon in the revolutionary army, and in the hospitals. He was a member of the state legislature, a member of the council; twice a member of congress; secretary of war 1809–12; minister to Holland 1814; governor of Massachusetts in 1824, and died while in office.

EUTAW SPRINGS, BATTLE OF, Sept. 8, 1781; between the American revolutionists under gen. Greene, and the British under col. Stuart. The British retreated, losing about 630 men; the American loss was 535. The scene of the battle was about 60 m. n.w. of Charleston, S. C.

EUTER'PE, a genus of palms, having male and female flowers intermingled on the same spadix, the spadices springing from beneath the leaves; the spathe entire, membranaceous, and deciduous. They are very elegant palms; with lofty, slender, smooth, faintly ringed stems; and pinnate leaves, forming a graceful feathery plume; the bases of the leaf-stalks sheathing far down the stem, and so forming a thick column of several feet in length at its summit. To this genus the cabbage palm of the West Indies, and the Assai palm of the banks of the Amazon, are often referred. See ARECA and ASSAI.

EUTER'PE (i.e., she who delights), one of the nine muses, was the daughter of Zeus and Mnemosyne. She was the muse of lyric poetry, and is represented in ancient works of art with a flute in her hand. See MUSES.

EUTRO'PIUS, a Latin historian, concerning whom we only know that he filled the office of secretary to the emperor Constantine, fought against the Persians under Julian, and was still alive in the reign of Valens. The period of his death is unknown. His *Breviarum Historiæ Romanæ,* giving a short narrative of Roman history from the foundation of the city to the time of the emperor Valens, is written in an extremely simple and pure style, and appears to have been originally intended for the use of schools. It became very popular as the taste for original investigation declined, in that dark period between the death of the old world and the birth of the new; and is either copied or followed by the early monkish annalists. An edition, with enlargements, however, was published by Paul, son of Warnefrid ud Theodolinda, generally known as Paulus Diaconus. Others continued it down to the year 813. The history existed in three distinct forms at the revival of letters: there was first the genuine work of E. in ten books; second, the expanded editions of Paul; and third, a very complete, but also largely interpolated copy contained in the *Historia Miscella.* The *editio princeps,* printed at Rome in 1471, was from the impure text of Paul. The best editions in modern times are those of Tzschucke (Leip. 1796, improved 1804), and of Grosse (Halle, 1813; Leip. 1825).

EU'TYCHES, a Byzantine ecclesiastic of the 5th c., and a zealous but unskillful representative of the dogmatic opinions of Cyril of Alexandria. In opposing the doctrines of Nestorius, he fell into the opposite extreme, and taught that after the union of the two natures in Jesus Christ, the human nature was absorbed in the divine; an opinion which spread extensively through the Alexandrian church. E. was in consequence summoned before a synod at Constantinople in the year 448, and deposed by Flavianus,

patriarch of that city; but his cause was warmly espoused by the eunuch Chrysaphius, chief minister of the emperor Theodosius II., and Dioscurus, bishop of Alexandria, who were both opposed to Flavianus. Chrysaphius induced the emperor to call a general council at Ephesus in the following year, under the presidency of Dioscurus. Measures were taken beforehand to secure a triumph over the anti-Eutychians. Soldiers were admitted to the deliberations of the council, to overawe the party of Flavianus; while a crowd of fierce Egyptian monks, devotedly attached to whatever was popular in Alexandria, or had been countenanced by their old pupil Cyril, drowned by their fanatical outcries the voices of those who ventured to speak against Eutyches. The result was that the judgment of the previous council was reversed; Flavianus and his adherents were deposed, and the doctrine of E. affirmed to be orthodox, and in accordance with the Nicene creed. His triumph, however, lasted only two years; in 451, Eutychianism was pronounced heresy at the council of Chalcedon, attended by 650 bishops; and in opposition to his views, it was declared that in Christ the two natures were united without confusion or conversion of substance. Nothing further is known concerning E., except that Leo wrote to the emperor Marcian to banish him from the capital. The sect of Eutychians, however, under the name of Monophysites, continued to exist quietly for a century after his death, in the Armenian, Ethiopian, and Coptic churches, when it awoke to new life under the auspices of Jacob Baradæus, who died bishop of Edessa, 588 A.D. His followers were called Jacobites, and have perpetuated the Monophysite doctrine in the Armenian and Coptic churches to the present day. See Neander, *Kirchengeschichte*, vol. iii., p. 1079, etc.

EUX'INE (Gr. *euxinos*, hospitable) is the name applied by the ancients to the Black sea (q.v.). Before receiving this name it was called *Axenos Pontos*, the inhospitable sea, because of the black and turbulent weather so frequently ascribed to it by the ancient poets, and the reported cannibalism of the Scythian tribes who lined its northern shores. It seems to have been called the *Euxine*, or hospitable sea, after the establishment of Greek colonies on its borders, and when its waters were thrown open to Greek commerce.

EUYUK, or UYÜK, a Turkish village in Asia Minor, 75 m. w.s.w. of Amasia. It has but about 20 houses, but is important as containing some of the most remarkable ruins in the east. They are the remains of a large building, and consist of colossal blocks of granite containing a great variety of sculptures very little defaced. The upper portion of the wall seems to have been formed of clay, as there are no remains of overturned materials. In form the building resembles an Assyrian palace, and has been conjectured by some to have been erected by the builders of the palaces of Nineveh, adopting in this instance, as they are known to have done in others, Egyptian figures and emblems. But not merely from the sphinxes, but also from the character of the human figures, Van Lennep considers that it was more probably a temple erected by Egyptians, who adopted an Assyrian form of building; and he conjectures that it dates back to the earliest Egytian conquests in Asia Minor.

EVAG'ORAS, King of Salamis, 410 B.C. Isocrates says he was a just and wise ruler, who promoted the welfare of his people. He cultivated the friendship of the Athenians, and after Conon's defeat at Ægospotami gave that officer a refuge. He made friends of the Persians, and assisted them and the Athenians in gaining the victory of Cnidus, 394 B.C. In 387, he was at war with the Persians, but soon made peace. He was assassinated 374 B.C.

EVA'GRIUS, b. Syria, 536 A.D. He was an advocate at Antioch, and the legal advisor of Gregory, the patriarch. The emperor Tiberius made him a quæstor, and his influence and reputation were such that on the occasion of his second marriage he was given a public festival, which, however, was interrupted by an earthquake, in which 60,000 persons are said to have perished. He was the author of a valuable *Ecclesiastical History*.

EVAN'DER, a semi-mythical Grecian hero of antiquity, was, according to Roman traditions, the son of Hermes, by Carmenta or Tiburtis. About 60 years before the Trojan war, he is said to have led a Pelasgian colony from Pallantium, in Arcadia, to Italy, and to have landed on the banks of the Tiber, and near the foot of the Palatine hill. Here he built a town, naming it Pallantium, after the one in Arcadia. At a later period it was incorporated with Rome, and is affirmed to have originated the names Palatinus and Palatium. Tradition represented E. as having done much to introduce the habits of social life among his neighbors; he prescribed for them milder laws, and taught them, among other arts, those of music and writing. To him is also ascribed the introduction of the worship of the Lycæan Pan, with that of Demeter, Poseidon, and other deities. Virgil represents him as being still alive when Æneas arrived in Latium after the sack of Troy. E. was worshiped both at Pallantium, in Arcadia, and at Rome.

EVANGELICAL is an adjective derived from the Gr. *euangelion*, "good news," or "the gospel," and is applied in general to anything which is marked by the spirit of the gospel of Jesus Christ. Thus, we speak of an E. sermon, of E. piety, E. views, etc., though it is but right to mention that the term "E." in such a connection is used

by a portion of the religious community to denote, not so much a spirit or sentiment resembling that of the Saviour, but certain peculiar theological opinions, which are held to constitute the only true and complete expression of Christian belief. In England and Scotland, dissenters have generally laid claim to be considered more "E." than the national churches—i.e., they conceive that they have borne, and still bear, more decided testimony than their brethren of the establishment to the truth of such doctrines as the total depravity of human nature, the imputation of Adam's sin to his posterity, the expiatory character of Christ's sufferings, justification by faith in the atoning efficacy of these sufferings, etc. In the Anglican church, however, the rise of the Puseyite or Tractarian party has brought into prominence an antagonistic party, resembling dissenters very much in their theological tenets. This party calls itself, *par excellence*, "evangelical."—In Germany, all Protestants call themselves E., in opposition to Catholics, on the ground that the reformers taught the pure gospel of the grace of God in Christ, cleansing it of all human corruptions. The modern orthodox or pietistic party in the German Protestant churches have of late made exclusive claim to the attribute E., on the ground that they alone hold to the gospel in its actual historical shape. This claim is naturally disputed by the liberal theologians.

EVANGELICAL ALLIANCE, an association of "evangelical Christians belonging to various churches and countries," formed in 1845, "to associate and concentrate the strength of an enlightened Protestantism against the encroachments of popery and Puseyism, and to promote the interests of a Scriptural Christianity." Its origin is to be ascribed to a deep sense of the evil of the divisions existing among Protestants, who nevertheless agree in holding the essential principles of the reformation. A number of circumstances concurred to direct the attention of Christians both in England and Scotland very strongly to this subject; and a requisition, signed by ministers and others belonging to various denominations in Scotland, was addressed to "the evangelical churches of England, Wales, and Ireland," convening a meeting to be held at Liverpool in Oct., 1845. To this requisition a cordial response was given; the meeting was numerously attended by persons of great influence, both in the established and dissenting churches; great harmony prevailed; and the E. A. was then organized. It now has branches in the most important cities and towns of Britain, and of many other parts of world; it has contributed to the promotion of Christian union, fellowship, and brotherly co-operation, and at least as evidently on the continent of Europe as in Britain; affording at the same time much encouragement to those who in various countries of the continent were struggling in the feebleness of isolation against all the forms of opinion most adverse to the principles of the reformation, but to whose support the strength of British Protestantism has been in some measure brought. The E. A. seeks, by various means, to promote the cause of "evangelical Protestantism," and to oppose "infidelity, popery, and other forms of superstition, error, and profaneness, especially the profanation of the Lord's day." It has also ventured to remonstrate, and with some effect, against the persecution still practiced in some Protestant countries of the n. of Europe both against Protestant dissenters and Roman Catholics, and thus has sought to extend the influence of the principles of toleration. The meetings which have been held under its auspices in continental cities have also led to much temperate and friendly discussion on various important questions. Great meetings of the E. A. were held at Paris in 1855, at Berlin in 1857, and Geneva in 1861, and at New York in 1873. At the Paris exhibition of 1867, the E. A., with the sanction of the French government, erected the *Salle Evangelique*, where meetings for divine worship and united prayer were held daily.

The E. A. adopted as its basis a brief statement of the points of doctrine on which its members must hold "what are usually understood to be evangelical views." This gave rise to objections against it on the part of some who would gladly have joined it, but for an apprehension of compromising principles to which they did not think due place was given.

Its basis excludes those who, although otherwise holding evangelical doctrines, deny "the divine institution of the Christian ministry, and the authority and perpetuity of the ordinances of baptism and the Lord's supper." The transactions of the alliance are reported in a monthly periodical, issued under its auspices, entitled, *Evangelical Christendom*.

EVANGELICAL ALLIANCE (*ante*). This voluntary association of Christians belonging to various denominations and countries, had its origin in a general and strong desire for a more practical union among Protestants in order to promote the cultivation of Christian fellowship and the extension of Christian faith. After full conference and correspondence the alliance was formed in Freemason's hall, London, Aug. 19–23, 1846, at a meeting, of about 800 persons, Episcopalians, Presbyterians, Independents, Methodists, Baptists, Lutherans, Reformed, Moravians, and others. Among these were many distinguished ministers and philanthropists from Great Britain, Germany, France, Switzerland, and the United States. The following doctrinal articles were adopted, not as a binding creed, but simply as an expression of the points of faith considered essential among those who are embraced in the alliance. 1. The divine inspiration, authority, and sufficiency of the Holy Scriptures. 2. The right and duty of private judgment in

the interpretation of the Holy Scriptures. 3. The unity of the Godhead and the Trinity of the persons therein. 4. The utter depravity of human nature in consequence of the fall. 5. The incarnation of the Son of God, his work of atonement for the sins of mankind, and his mediatorial intercession and reign. 6. The justification of the sinner by faith alone. 7. The work of the Holy Spirit in conversion and sanctification. 8. The immortality of the soul, the resurrection of the body, the judgment of the world by our Lord Jesus Christ, with the eternal blessedness of the righteous and the eternal punishment of the wicked. 9. The divine institution of the Christian ministry and the obligation and perpetuity of the ordinances of baptism and the Lord's supper. The organization thus happily commenced has since been extended throughout Protestant Christendom. Branch alliances have been formed in Great Britain, Germany, France, Switzerland, Sweden, the United States, Australia, and among the missionaries in Turkey, India, Brazil, and Japan. These national branches are related to each other as members of a confederation having equal rights. The whole alliance appears in active operation only when it meets in general conferences having the character of Protestant ecumenical councils, but claiming only moral and spiritual power. These have already been held at London, 1851; Paris, 1855; Berlin, 1857; Geneva, 1861; Amsterdam, 1867; New York, 1873; Basle, 1878. The most enthusiastic and effective of these was the one at New York, when, for the first time, Christians from all parts of the earth met together in the new world to take counsel concerning the condition of Christendom, Christian union, Christian life, Christianity and unbelief, Christianity and error, Christianity and civil government, Christian philanthropy, and reform of social evils. The visible results of the E. A. may be seen, in part, in its promotion of religious liberty wherever that has been restricted or assailed. Since its organization several cases of persecution have occurred in southern Europe under the operation of penal laws against Protestants. In these cases the influence of the alliance has been successfully exerted to bring the persecution to an end. It has aided in bringing about the remarkable changes in favor of religious liberty which have taken place in Turkey within the last quarter of a century. It interceded for the Methodists and Baptists in Sweden, and that country has since abrogated its penal laws against dissenters. It sent a delegation in 1871 to the czar of Russia to plead for the Lutherans in the Baltic provinces, and since that time they have not been oppressed. It remonstrated against the persecution of Roman Catholic and other Christians in Japan, and the persecution has not been renewed. These instances are sufficient to show that the power of Christian public sentiment, as expressed by the alliance, already commands a respectful hearing everywhere, and must, ultimately, be universally obeyed.

EVANGELICAL ASSOCIATION, a religious body which was organized in 1803 among Germans in the United States of North America, and has considerably extended itself both in that country and in Canada, being no longer chiefly confined, as it was at first, to German immigrants and their descendants using the German language. Its doctrines are a modified Calvinism; its church government a modified episcopacy.

EVANGELICAL ASSOCIATION (*ante*), called sometimes, incorrectly, the German Methodist church, is a sect of American Christians, originally of German descent, formed under the influence of the Rev. Jacob Albright, who, looking with regret on certain doctrines and habits prevalent among the German churches of eastern Pennsylvania, endeavored to reform them. A meeting of his converts in 1800 chose him as their pastor or bishop, and gave him jurisdiction as such over the members of the association. Subsequently annual conferences were established, and in 1816 a general conference, consisting of all the elders, met in Union county, Penn. Since 1843, general conferences, consisting of delegates from the annual conferences, have been held every four years. During its earlier years the E. A. was violently opposed, but for the last half century it has been quiet and prosperous. As it denounced slavery it made no progress in the southern states, but it has spread over the n., into Canada and even Germany. In theological doctrine it is described as endeavoring to blend Calvinistic and Arminian views; in polity, worship, and plans of work it resembles the Methodist Episcopal church; the ministers are divided into elders and deacons; the bishops (elected by the general conference) and the presiding elders (elected by the annual conference) continue in office four years, and may be re-elected. At first, preaching and other public services were conducted almost exclusively in the German language; now, however, the English also is employed. The denomination has a flourishing college at Plainfield, Ill. In 1878, it reported 19 annual conferences, 1400 preachers (itinerant and local), 1422 houses of worship, 401 parsonages, 108,000 church-members, 1846 Sunday-schools with 132,625 teachers and scholars, $85,400 contributed to missions and other departments of benevolent work.

EVANGELICAL CHURCH CONFERENCE is the name given to periodical meetings of the Protestant churches of the German states, the holding of which was suggested by king William of Würtemberg in 1815. The first was held at Berlin in 1846 and included representatives from nearly all the German states. At the second, held at Eisenach in 1852, a central organ was established at Stuttgart. From 1855 to 1868, the conferences were held at Eisenach.

EVANGELICAL COUNSELS are given by the Roman Catholic church when it recommends certain things to any one who is willing to practice them, not as in themselves obligatory, but as conducive to the attainment of superior holiness. Among them the principal are celibacy, poverty, and submission to monastic rules. Some writers include under this title various Scripture directions, such as "Resist not evil;" "If any man will sue thee at the law and take away thy coat, let him have thy cloak also;" "Whosoever shall compel thee to go a mile, go with him twain."

EVANGELICAL UNION, the name assumed by a religious body constituted in Scotland in 1843 by the Rev. James Morison of Kilmarnock (now Dr. Morison of Glasgow), and other three ministers (with their respective adherents), who had been separated from the United Secession church for doctrinal views, of which the fundamental and determining article was the strict universality of the Saviour's atonement. Coeval with the body is its theological academy, presided over by Dr. Morison, and attended by over twenty student annually. They were soon joined by a number of ministers and churches of the Congregational union of Scotland, and have since extended themselves considerably in Scotland and the n. of England. Their church government is independent, but many congregations have ruling elders. Their doctrinal views are exhibited in an authorized publication, entitled *Doctrinal Declaration*, issued in Sept., 1858. See MORISONIANISM.

EVANGELIST, literally, a bringer of good tidings. It designates, in the New Testament, a person appointed by an apostle to itinerate among the heathen, and so prepare the way for resident instructors. The evangelist, therefore, had no particular flock assigned to him, and is to be distinguished both from bishops and ordinary pastors. Later in the history of the early church, the evangelist figures, according to Eusebius, as "a deliverer of the written gospels to those who were ignorant of the faith." This may possibly imply that he acted as a colporteur, by distributing copies of the gospels, or that he read them to the heathen, and so made them familiar with their contents.—The word evangelist is also used to denote the four writers of the life and gospel of Jesus Christ, these being evangelists ("bringers of good tidings") *par excellence*.

EVANGELISTS, SYMBOLS OF THE FOUR. For Matthew: a man holding a pen and scroll, looking over his left shoulder at an angel: Matthew's was the first gospel, and the angel represents the dictator of it. For Mark: a man writing, and at his side a winged lion couchant, emblematical of the resurrection which is most fully described by this evangelist. For Luke; a man with a pen looking over a scroll, and near by an ox or cow chewing the cud; the latter figure refers to the eclectic character of the third gospel. For John; a young man of delicate appearance, with an eagle in the background to denote sublimity. The more ancient symbols were: for Matthew, a man's face; for Mark, a lion; for Luke, an ox; for John, a flying eagle: all alluding to the four cherubim before the throne of God, described in the *Revelation*.

EVANS, Lieutenant-general Sir DE LACY, G.C.B., b. at Moig, in Ireland, 1787; entered the army as ensign in 1807; in 1812, joined the 3d light dragoons, with whom he saw much peninsular service. In 1814, he was present as brevet lieut.col. of an infantry regiment at the capture of Washington, the attack on Baltimore, and the operations before New Orleans. He was next at Waterloo. In 1830-31, he sat for Rye, and in 1833 was elected on the liberal interest for Westminster, which he represented until 1841. The cause of the young queen of Spain was believed by the English ministry to be identified with that of freedom and constitutional government, and an order in council was issued in 1835, authorizing the raising of 10,000 men for service in Spain, and expressing the king's desire that his subjects should take part with the queen of Spain, his ally, by entering the new corps. The command of the British auxiliary legion was offered to E., and he was allowed by his constituents to accept it without vacating his seat for Westminster. E.'s principal military exploits at the head of the British legion were the storm and capture of the Carlist lines of Ayetta, near St. Sebastian, in 1836; the storm and capture of Irun; and the capture of Oyarzun and Fontarabia. For these services, he received the grand crosses of St. Ferdinand and Charles III. At the general election for 1841, E. was defeated for Westminster, but was re-elected in 1846, and continued to hold his seat, by undisputed tenure, till 1865. He was promoted to the rank of maj.gen. of the British army in 1846, and obtained the colonelcy of the 21st foot in 1853. On the declaration of war against Russia, he was appointed to command the second division of the army sent out to the Crimea, with the rank of lieut.gen. His division was hotly engaged in the battle of the Alma, and E. received a severe contusion of the shoulder. On the 26th Oct., during the siege of Sebastopol, his division was attacked by a force of 6,000 Russians. E. met the enemy with great gallantry, and drove them back into the town. In Feb., 1855, E. attended in his place, and received the public thanks of the house of commons, through the speaker, for his services in the Crimea. He was rewarded by the crown with the grand cross of the bath, and by the emperor of the French with the grand cordon of the legion of honor. He also received the degree of D.C.L. from the university of Oxford. He took a frequent part in debates on matters of army administration. In politics, he always belonged to the party of "advanced liberals." He died Jan. 9, 1870.

EVANS, FREDERICK WILLIAM, b. England, 1808; came to the United States in 1820; returned to England, and became interested in Owen's theories and joined the Shakers. Returning to America, he soon became a leader of the Shakers in this country, residing at New Lebanon, N. Y. He has published a number of works on the history and doctrines of that peculiar people. As a leader he has excellent faculty; as a writer his earnestness and a certain sharpness of style mark him as the chief polemic of his sect.

EVANS, Miss MARIAN, known under the *nom de plume* of "George Eliot," was b. in Warwickshire about the year 1820. Before she became known as the author of the remarkable series of fictions with which her name is popularly associated, she had already acquired reputation in the literary circles of the metropolis as a writer of distinguished ability. She contributed largely to the *Westminster Review*, of which she was at one time editor; and translated the famous *Leben Jesu* of the late Dr. Strauss, her English version of which was published in 1846; and also Feuerbach's *Essence of Christianity*. During 1857, there appeared in *Blackwood's Magazine*, with the signature of George Eliot, a series of stories under the title of *Scenes of Clerical Life*, the very unusual merit of which instantly attracted attention. They seemed to proclaim with great distinctness the advent of a new novelist of fresh and original power. It was from the first sufficiently well understood that the signature was a mere *nom de plume;* and no little curiosity was excited as to the personality of the author unknown. This feeling was much deepened by the publication in 1858, by the Messrs. Blackwood, of the novel of *Adam Bede*, which attained an immense success, and at once secured for the writer almost undisputed rank with the most eminent novelists of the day. This was followed, in 1859, by *The Mill on the Floss*, which amply sustained the reputation of the writer; and in 1861 by *Silas Marner, the Weaver of Raveloe*, a tale in one volume, which, as to art, is perhaps the most perfect of any of this series of works. In 1861, the *Scenes of Clerical Life* were republished from *Blackwood's Magazine*, to meet with a renewal of the favor with which they were originally received; and in 1863, *Romola*, an elaborate historical novel of Italian life, was published by Messrs. Smith, Elder & Co., in whose *Cornhill Magazine* it had previously from month to month appeared. This work has never had quite the popularity of its predecessors, but is considered by a selecter circle of readers—and perhaps on the whole with justice—the greatest intellectual effort of the author. Meantime—though the avowal has never in any formal fashion been made—it had by degrees become positively certain that Miss E. was the "George Eliot" of these works; and by not a few competent critics a place had been frankly assigned her at the very summit of this branch of our literature. *Felix Holt, the Radical*, published in 1866 by Messrs. Blackwood, was distinctly *the* book of the season, and was almost everywhere received with acclamation. *Middlemarch, a Study of English Provincial Life*, began to be published in divisions by Messrs. Blackwood in 1871. It was completed in 8 divisions, the last of which was issued in 1872, and simultaneous with it the entire work appeared in 4 vols. The divisions had an enormous circulation, and enhanced Miss E.'s great reputation. *Daniel Deronda* was published in the same way in 1876. Miss E. has also published poetry of a high degree of merit. *The Spanish Gypsy* was published by Messrs. Blackwood in 1868; in 1869 appeared *Agatha, a poem;* in 1870, *The Legend of Jubal*, a poem of great power; and in 1871, *Armgart, a dramatic poem.* In 1879 appeared a volume of essays, *The Impressions of Theophrastus Such*, which in a month or two reached a fourth edition.

EVANS, MARIAN (*ante*), was the daughter of a poor clergyman, but in early life was adopted by a wealthy clergyman, who gave her a first-class education. When she left school, while she was still very young, Mr. Herbert Spencer became her tutor and friend, and, under his training, her mind was developed rapidly and broadly. She applied herself to languages, mastering German, French, and Italian; became an accomplished musician; and familiarized herself not only with the fine arts, but also with metaphysics and logic. While in this stage she translated Strauss's *Life of Jesus;* and soon afterwards became one of the staff of the *Westminster Review*. Here, by her intimacy with Mr. John Stuart Mill and others, she became confirmed in their peculiar religious and philosophical views. She was known as the wife of George Henry Lewes (q. v.), who d. 1878. Early in May, 1880, she married John Walter Cross, a rich English merchant, 10 or 15 years her junior.

EVANS, OLIVER, 1755–1819; b. Del. He was apprenticed to a wheelwright, but soon displayed uncommon inventive genius. When 22 years old he invented a machine for making card-teeth which superseded hand work. He made the first high-pressure steam-engine and the first steam dredging machine used in this country. This machine was put on wheels and propelled itself to the Schuylkill river, 1½ m.; was fitted with a steam paddle-wheel and navigated the Schuylkill down to its junction with the Delaware. This is supposed to have been the first actual propulsion of a carriage on land by steam in America. He urged the construction of railroads with rails of wood or iron, but was hindered by limited means from carrying out the idea to any practical result.

EVANSTON, a village in Cook co., Ill., on lake Michigan, 12 m. n. of Chicago; reached by the Milwaukee division of the Chicago and Northwestern railroad; pop. of township, '70, 3,062; in '80, 6,703. Evanston is the seat of Northwestern (Methodist)

university, the Evanston college for women, and the Garrett biblical institute. It has a beautiful situation, many fine buildings, and social attractions of a high order.

EVANSVILLE, a flourishing city of Indiana, in the United States, stands on the right bank of the Ohio, about 150 m. s.w. of Indianapolis. It is very advantageously situated for trade. From E. downwards, the navigation is seldom interrupted either by drought or by ice; and here terminates the Wabash and Erie canal, the longest work of the kind in the American republic. Thus, the place connects the lower Ohio at once with the inland lakes and with the gulf of Mexico. Coal and iron ore abound in the vicinity. Pop. '70, 21,830.

EVANSVILLE (*ante*), a port of entry and city in Vanderburg co., Ind., on the Ohio river, midway between Louisville and Cairo; on the St. Louis and Southeastern, the Evansville and Terre Haute, and the Lake Erie, Evansville, and Southwestern railroads; pop. about 35,000. The city contains a custom-house, marine-hospital, opera-house, court-house, several public halls, and is the center of a very large trade in agricultural products. It is also important for manufactures.

EVAPORATION, the conversion of a fluid or solid into vapor. Steam, vapors of alcohol, camphor, iodine, etc., are familiar instances. All fluids are surrounded by vapor at common temperatures; but for every substance there is a limiting temperature, below which no E. takes place. The pressure, or tension, of a vapor depends mainly upon the nature of the substance evaporated, and the temperature to which it is raised. The full amount of vapor, however, is not produced instantaneously, and therefore, in general, *time* is an element in the question as well as temperature. See DIFFUSION.

The boiling-point (q.v.) is the temperature at which vapor is freely given off—i.e., at which the tension of the vapor of a substance is equal to the atmospheric pressure. Dalton gave an empirical law, which, however, is only at all approximate for temperatures near the boiling-point: "The tension of the vapor of a substance rises in *geometric*, as the temperature rises in *arithmetic*, progression." It is sufficient for our present purpose to notice, that the tension increases very rapidly with the temperature. Some curious consequences result from this. Thus, water boils at 212° F., under a pressure of 30 in., or at that temperature the tension of its vapor is *one* atmosphere. At 162° F., or 50° below its boiling-point, its vapor has a tension of 10 in. of mercury, and it will therefore boil, if placed in the receiver of an air-pump, as soon as two thirds of the air have been extracted.

If a little water be boiled in an open flask till the steam has displaced a great part of the contained air, and the flask be then tightly corked, the water will gradually cool. If the flask be now dipped in *cold* water, boiling recommences, the cold water having condensed some of the vapor, and so diminished the pressure on the contained liquid. Dip the flask in *hot* water, and the boiling ceases. These appearances may be obtained several times in succession.

A fluid cannot be heated above its boiling-point, at the ordinary pressure of the atmosphere; but if it be heated in a closed vessel, the tension of the vapor produced is to be taken in addition to the former pressure, and the boiling-point rises with it. Thus, when the pressure is equivalent to 2 atmospheres, the boiling-point of water is raised 40° F. At such temperatures, its solvent powers are greatly increased. Many minerals which are found in fine crystals are supposed to have been deposited from water which had dissolved them in large quantities, under the combined influences of pressure and temperature. Papin's digester (q.v.) depends upon this principle.

The amount of E. from a fluid depends upon many circumstances. As, except in the case of actual boiling, it takes place only at the surface, the amount of surface exposed is an important consideration where rapid and copious E. is required, as in steam-boilers, salt pans, etc. When, on the contrary, it is desirable to prevent E. as much as possible, a layer of oil, preventing direct contact with the air, is of great use. The rate of E. depends also on the pressure, and varies, according to Daniell, nearly inversely as the latter. His experiments, which appear trustworthy, were made in an exhausted receiver, and the vapor was removed as it was formed.

In the conversion of a fluid into vapor, a quantity of heat disappears; i.e., is required to produce and maintain the gaseous state. Thus, the temperature of steam at 30 in. is the same (to the thermometer) as that of the boiling water from which it comes off; but the heat necessary to convert a pound of water at 212° into steam at 212°, would raise nearly 1000 pounds of water from 60° to 61°. See HEAT. When, therefore a fluid evaporates, the vapor carries off heat from the fluid, and thus E. produces cold. This, of course, is matter of daily observation. Porous earthenware jars are employed to cool water in summer in this climate; and in India ice is procured by exposing water in shallow pans, laid on straw, to the combined effects of E. and radiation at night.

On the same principle depends sir John Leslie's method of freezing water. The water is placed in a flat porous dish, over a large surface of strong sulphuric acid, and the whole covered with the receiver of an air-pump. When a good vacuum has been produced, there is, of course, as we have already seen, a rapid E., and the acid eagerly absorbing the vapor as it is formed, the process goes on without further working of the pump, till the residual water has become a solid cake of ice. A most extraordinary

example of this production of cold is afforded by the freezing of water on a white hot plate—by no means a difficult experiment. A platinum capsule is heated nearly to whiteness by a lamp placed underneath; a little water, mixed with sulphurous acid, which is an extremely volatile liquid (indeed it is gaseous at ordinary temperatures and pressures), is poured upon the plate. The acid instantly evaporates, and the cold produced freezes the water, which can be dropped from the hot plate on the hand as a lump of ice.

Another remarkable instance of this occurs in the formation of solid carbonic acid. The liquid acid is forced by the pressure of its own vapor in a fine stream into the air from a nozzle in the strong iron vessel in which it is contained. It evaporates so rapidly in air that a portion of the stream is frozen, and the delicate snow-like mass can be collected by proper apparatus.

Having thus briefly examined some of the circumstances connected with E., we may proceed to mention some of its important bearings on meteorology. In this respect it is one of the most effective of all the gigantic processes that are continually going on around us. Watery vapor is continually rising invisible in the air; meeting with a colder stratum of the atmosphere, or the cold ridge of a mountain, it becomes condensed into mists or clouds; the fine particles of these unite into larger groups, and fall as rain, hail or snow—to be again evaporated by heat from the moist ground, or from rivers, lakes, and seas. Even when otherwise invisible, its presence may be detected by its deposition as dew (q.v.), and, according to Clausius, in the blue of the sky, and the gorgeous tints of sunrise and sunset. There is little doubt of its being also intimately connected with the scintillation of the fixed stars. See SCINTILLATION. Atmospheric electricity is largely due to E. directly as well as indirectly, on account of the amounts of vapor contained in different currents of air. It is matter of everyday observation how much the drying of the ground, or E. generally, is promoted by a brisk wind. This finds its explanation in the constant removal of the vapor as it is formed, the diffusion of the vapor taking place into comparatively dry air instead of the moist atmosphere into which it would take place in a calm. See RAIN and ATMOSPHERIC ELECTRICITY.

EVARTS, JEREMIAH, 1781-1831; b. Vt.; graduate of Yale; admitted to the bar in 1806, and in 1810 became editor of the *Panoplist*, a religious journal in Boston. In 1812, he became treasurer of the American board of commissioners for foreign missions, and in 1821 corresponding secretary. When the *Panoplist* gave place to the *Missionary Herald*, he became editor of the latter, and by many essays and other contributions showed himself a most efficient advocate and organizer of Christian missions. He also wrote 24 essays on the rights of the Indians.

EVARTS, WILLIAM MAXWELL, LL.D., b. Boston, Feb. 6, 1818; son of Jeremiah. He graduated at Yale in 1837, and studied in the Harvard law school under justice Story and prof. Greenleaf; was admitted to the New York bar in 1841; deputy U. S. district attorney, 1849–53, during which period he became conspicuous in prosecuting persons engaged in filibustering expeditions to Cuba. In 1853, he was counsel for the state of New York in the Lemmon slave case. In the impeachment trial of president Johnson, he was the leading counsel for the defendant, and in 1872 he was counsel for the United States before the tribunal of arbitration at Geneva. He was then and still is president of the New York bar association. Among many noted cases in which he has appeared are the Parrish will case; the will case of Mrs. Gardner, mother of the widow of president Tyler; as senior counsel for Henry Ward Beecher in the Tilton suit; and as advocate (on the republican side) before the electoral commission. He has made many public addresses, such as the eulogy on chief-justice Chase, the centennial oration at Philadelphia, and at the unveiling of the statues of Webster and Seward in New York. He was an early and active member of the republican party. In July, 1868, he was appointed attorney-general of the United States, and in Mar., 1877, became secretary of state, which office he now holds. All his public work shows high scholarship and affluent thought.

EVE (Heb. *Chavvah*, i.e., the living), the name, according to the Hebrew narrative, of the wife of the first man, and so the mother of the human race. See ADAM AND EVE.

EVEC'TION, a lunar inequality resulting from the combined effect of the irregularity of the motion of the perigee, and alternate increase and decrease of the eccentricity of the moon's orbit. See LUNAR THEORY.

EV'ELYN, JOHN, a well-known writer of the 17th c., was b. Oct. 31, 1620, at Wotton, the seat of the Evelyn family, in Surrey. He was educated at the free school of Lewes, and subsequently at Balliol college, Oxford. In 1640, he entered the middle temple, and in the following year, prompted by the ominous appearance of public affairs, and after having witnessed the trial of Strafford, he set out for the continent, returning, however, in the autumn of the same year. In 1642, upon offering his services to Charles I., he was accepted as a volunteer in prince Rupert's troop, but in 1643 he again went to the continent, where he mainly lived during the following eight years. After 1652, he settled in England, where he lived studiously and in private till the restoration, after which he was much employed by the government. On the organization of the royal

society, he became one of the first members, and was an industrious contributor to its transactions. He succeeded, in 1699, to the family estate at Wotton, and there, after a long, studious, and highly useful life, he died 27th Feb., 1706.

His pen seems to have been constantly employed, and that upon a great variety of subjects. Art, architecture, gardening, commerce, etc., were all treated of by E., and in such a manner as to produce the most beneficial results on his own time. His principal works are *Sculptura, or the History and Art of Chalcography and Engraving on Copper*, 1662; *Silva, or a Discourse of Forest Trees, etc.*, 1664; and his *Memoirs* (first published in 1818). It is to the last of these works E. owes the celebrity he now enjoys. The *Memoirs* are written in the form of a diary, by one who had accustomed himself to habits of close observation, and continued during a period of about 70 years—and these the most dramatic in the recent history of England. They are of inestimable value. Sir Walter Scott said that "he had never seen a mine so rich." New editions were published in 1850, 1854, and 1870.

EVEM'ERUS, or EUHEMERUS, a Greek scholar of the latter part of the 4th c. A.D. He is noted chiefly for his *Sacred History*, founded professedly on archaic inscriptions which he had collected during his travels in various parts of Greece, and more especially on those observed on the temple of Jupiter Triphylianus, in the island of Panchæa. In this work, he introduced a new method of interpreting the popular myths, asserting that the gods who formed the chief objects of popular worship were mortals who, as heroes and conquerors, had earned a claim to the veneration of their subjects. Till the end of the last century, there were many who accepted this system of Evemerus, and the early Christians especially appealed to it as a confirmation of their belief that the ancient mythology was merely an aggregate of fables of human invention. Evemerus was a firm upholder of the Cyrenaic philosophy, and by many ancient writers he was regarded as an atheist, because of his dissent from the prevalent polytheism. Of his work only a few fragments remain in a Latin translation by Ennius.

EVENING PRIMROSE. See ŒNOTHERA.

EVENING SCHOOLS may be divided into two classes: 1. Those which, either in the form of lectures or lessons, carry further the education received at school; 2. Those which exist to supplement the defects of early training, or, it may be, to give the simplest rudiments of elementary instruction to adults who are under the disadvantage of being pupils for the first time in their lives. The former are found chiefly in connection with mechanics' institutes* (which are now very numerous in Great Britain, and might form one of the most important educational agencies we have), existing day schools, and congregational organizations; while the latter more frequently fall under the head of parochial missionary work, or are connected with factories. These latter constitute the class of E. S. which engage the largest share of interest in the present condition of England, and which present the greatest difficulties in working.

The total number of E. S. of this humbler class (under government inspection) in operation in England and Wales was, in 1877, about 1733; of these, 1078 were conducted by the church of England, 340 by dissenting Protestant denominations, 62 by Roman Catholics, and 253 by school-boards. The total number of scholars in attendance was 50,203, of whom 40,320 were male. In Scotland, *primary* E. S. are not so usual as in England; and this is no doubt to be greatly attributed to the more general diffusion of education among children of the poorer classes.

Considering the large proportion of the present adult population unable to read or write, the number of E. S. is miserably inadequate. But the necessity for their institution has not yet been sufficiently felt by the country, to lead to their taking a much more important place in the educational machinery of the nation than they have hitherto done. Her majesty's inspectors, the royal commissioners (1861), and the clergy of all denominations, strongly recommend their greater extension. "If the education of the country were in a good state," say the commissioners, "E. S. would be nearly universal, and would serve to compensate the scantiness of the instruction given in day schools, by giving more advanced instruction to an older class of scholars."

State Aid, and Voluntary and Paid Teachers.—Many educationists have come to the conclusion, that the hope of retaining children in school until they have obtained as much instruction as is requisite for their guidance in life is a vain one, and consequently look to E. S. as an indispensable part of a national system of education, and consider them entitled to look to the state for encouragement and support to an equal extent with day schools. Bishop Hinds was the first *publicly* to suggest that E. S. fairly come within the sphere of state action, in a letter to Mr. Senior, printed in 1839. The recent inquiries have brought out that the majority of those who frequent existing E. S. have never received any elementary instruction, or have forgotten what they once knew, and that a large proportion are either adults or adolescent young men and women. They attend for the purpose of learning to read, write, and cipher. Though in many instances, especially where no fee is charged, the irregularity and unpunctuality of the attendance are great, yet in the majority of cases there is an earnest desire on the part of the pupils

* The working-man's college in London, and the school of arts in Edinburgh, both belong to this class.

to benefit by the instruction they receive. It is a question of some national importance how far schools of this supplementary class should be left to the action of private philanthropy. It is also a question, to some extent implied in the other, whether the peculiarly delicate work required in E. S. is not more efficiently discharged by voluntary than by paid laborers.

1. As to the first question, it may be safely said, that all would desire to see those wholesome channels of benevolence which connect the poor and the rich free from government interference; but if, in our devotion to a theory, we neglect the work, it becomes the duty of the state to see to it, to the extent of encouragement at least, if not of direction. Since bishop Hinds' letter, to which we have referred above, the education committee of the privy council have recognized this duty, and have given aid to a small extent to all E. S. complying with certain conditions, and in connection with day schools. By the revised code recently issued by the privy council, E. S. of this class are allowed to claim from the parliamentary grant a considerable sum calculated on the average attendance. The schools must be taught by certificated masters, and lay persons are alone recognized. To all those schools frequented for the purpose of confirming or extending previous knowledge, the grants made under the code will be of great assistance, and enable them to secure the services of trained teachers; to those which are chiefly frequented by adults wholly ignorant of the simplest elements, and chiefly conducted by voluntary teachers, it will afford little or no advantage, because the conductors will not be able to claim so large a sum as would suffice to pay the salaries of certificated masters. Nor, perhaps, is it desirable to interfere with this particular class of E. S.; it is of more importance, so far as state aid is concerned, that the education of the primary school should be confirmed by the establishment of E. S. for *boys and girls*. There is active benevolence enough abroad to overtake the ignorance of the *adult* population, if properly stimulated by the various religious bodies.

The proposed new arrangements as to payment may also lead to the greater separation of such schools into schools for boys and girls above 13 and under 18, and schools for adults. It is found that boys and men, girls and women, do not work well together.

2. As to the second question: in those E. S. which are only a continuation of the day school, the same method will generally be found to suit as in the primary schools; and therefore it seems advisable that they should be conducted by paid certificated teachers, acting under managers (as in the case of ordinary day schools), and claiming grants from the privy council. Those schools, again, which are frequented by adults, who come to receive the elements of reading, writing, and arithmetic for the first time, require more delicate handling, and a greater consideration of individual character and wants than are requisite in a school attended by boys and girls. In such cases, voluntary effort under the influence of religious or merely philanthropic motives appears to be the best agency. The ignorance of method displayed by such teachers, and the irregular manner in which many of them hang to their work, are no doubt serious difficulties; but they may be overcome by the institution of diocesan or other unions, in imitation of the East Lancashire union of E. S. under the presidency of sir J. P. K. Shuttleworth, with each of which might be connected an organizing master, who should itinerate among the schools, giving the benefit of his superior knowledge of method.

Subjects and Method.—As to subjects to be taught, we have little to say to that class of E. S. which continue the work of the day school. It is to be presumed that practical instruction (and what else should be aimed at in such schools?) will embrace the elements of those sciences which bear most directly on life. We refer to social economy and the laws of health. E. S. of the humbler and more urgent sort will necessarily confine themselves to reading, writing, and arithmetic, inventing such methods of teaching those subjects as will most directly touch the intelligence and engage the interest. The short period of attendance requires that *much* be done rather than *many things*. Through a well-constructed course of reading-books (unfortunately, there is no reading series for adults worthy of mention), all the general culture and specific information attainable will best be given. If such reading-books do not furnish adequate information on social economy in its domestic and its wider social relations, and on the laws of health, they sadly misunderstand their position in educational literature. Instruction in writing and arithmetic should be given in such a way as will naturally connect itself with the lives and daily necessities of the learners. But this is not the place to treat of the subject of method.

History.—Although we have directed attention to the fact, that bishop Hinds was the first in this country to advocate state recognition for E. S., he was by no means the first to feel the necessity that existed for them. The first school established exclusively for adults was at Bala, Merionethshire, in 1811, by the Rev. T. Charles. In 1812, a similar school was set on foot in Bristol by William Smith and Stephen Prout, a school which led to the establishment of the "Bristol institution for instructing adults to read the Holy Scriptures." In 1813, writing was included in the school programme; and in 1816, a society of the same kind was founded in London. In the course of a few years, 30 towns possessed similar schools. The first *evening* school proper for instructing boys and girls who had to work all day for a livelihood, was founded in 1806 at Bristol, by the "benevolent evening schools' society." The present statistics of E. S. have been already given.

In other countries of Europe, E. S. where they exist, have mainly in view the continuance of the education already received in primary schools. In France, however, the wants of untaught adults have been provided for by the establishment by law of E. S. suited to them. In all the states of Germany, provision is made more or less in the country districts, and always in the large towns, for continuing the instruction given in the primary schools. Schools for those who wish to learn reading and writing for the first time seem scarcely to exist, probably because they are not needed. The schools which do exist have a greater affinity to our mechanics' institutes than to any other kind of institution in this country. The instruction is given on Sundays and holidays, and in many places also on one or two evenings in the week. But Sunday instruction seems alone to have been originally contemplated. The subjects taught are the ordinary branches, with geography, free-hand and geometrical drawing, geometry, and in some cases the elements of natural science and the laws of health. These institutions are supported by the funds of the commune or district; in some cases supplemented by the state.

EV'ERDINGEN, ALLART VON, 1621–75; a Dutch painter of coast and inland scenery, particularly of Norway, where he suffered shipwreck. His favorite theme was a fall in a glen, with mournful fringes of pines interspersed with birch, and log huts at the base of rocks and craggy slopes. The water in his scenes tumbles over the foreground so as to entitle the painter to the name of "inventor of cascades."

EVEREST, Sir GEORGE, 1790–1866; b. Wales. He was employed in various engineering works in India, was assistant to the chief in the trigonometrical survey of that country, and on the chief's death became his successor. Afterwards he was surveyor-general of India. His achievements in surveys were of the highest order.

EVEREST, MOUNT, in the Himalaya range in Nepaul, Asia; the highest mountain peak on the earth, so far as known. A careful measurement in 1856 made its height 29,002 ft. above tide, or within 38 ft. of 5½ English miles.

EVERETT, ALEXANDER HILL, an American diplomatist and author, was b. at Boston, Mass., 19th Mar., 1792, and entered Harvard college in 1802. In 1806, although the youngest of the *alumni*, he graduated with the highest honors. After practicing for some time as a lawyer, he was appointed U. S. ambassador at the Hague in 1818; and went in the same capacity to Spain in 1825. Four years afterwards, he returned to the United States, where he became proprietor and editor of *The North American Review* (1830–35), and also occupied a seat in the legislature of Massachusetts. In the winter of 1840, he resided, as a confidential agent of the U. S. government, in the island of Cuba. He sailed for China as minister-plenipotentiary for that empire in 1845, and died at Canton, June 28, 1847. E. was a man of great versatility of talent and of extensive erudition. Politics and belles-lettres, political economy and poetry, statistics and æsthetics, alternately engaged his thoughts and pen. His writings are—*Europe, or a General Survey of the Political Situation of the Principal Powers*, etc. (London and Boston, 1822); *New Ideas on Population*, etc. (London and Boston, 1822); *America, or a General Survey of the Political Situation of the several Powers of the Western Continent*, etc. (Phila. 1827), in which he labors to show that Russia and the United States must in the long-run share the continent between them; *Critical and Miscellaneous Essays* (two series, Boston, 1845 and 1847). These are on a vast variety of subjects, and are probably the most interesting productions of his pen. E. also published a volume of poems in 1845.

EVERETT, EDWARD, a younger brother of the preceding, was b. in 1794, at Dorchester, near Boston, Mass., entered Harvard college in 1807, and took his degree in 1811. He was for some time a Unitarian clergyman in the town of Cambridge, and in this capacity had the reputation of being one of the most eloquent and pathetic preachers in the United States. In 1815, he was elected professor of the Greek language and literature in Harvard college; and to qualify himself more thoroughly for his work, he visited Europe, where he resided for four years, and had a distinguished circle of acquaintance, including Scott, Byron, Jeffrey, Romilly, Davy, etc. M. Cousin, the French philosopher and translator of Plato, pronounced him "one of the best Grecians he ever knew." In 1820, E. became editor of *The North American Review;* and in 1824, a member of the United States congress, sitting in the house of representatives for ten years. In 1835, he was appointed governor of Massachusetts; and in 1841, minister plenipotentiary to the court of St. James's. While in England, he received from the universities of Oxford, Cambridge, and Dublin the degree of D.C.L. On his return to America in 1845, he was elected president of Harvard college; on the decease of Daniel Webster, he became secretary of state; and in 1853, the legislature of Massachusetts chose him as a member of the senate of the United States. He died Jan., 1865.

E.'s principal works are: *A Defense of Christianity* (1814); *Orations and Speeches on Various Occasions from* 1825 *to* 1836 (1836); and *Orations and Speeches on Various Occasions from* 1825 *to* 1850. This includes all the previous orations. These *Orations*, as they are called, are upon all subjects, and, like the writings of his brother, indicate a varied, vigorous, and flexible genius.

EVERETT, EDWARD, LL.D. (*ante*), b. Dorchester, Mass., April 11, 1794; d. Boston, Jan. 15, 1865; an American statesman, orator, and scholar, son of Rev. Oliver Everett. He was at one time a pupil in a Boston school, of which Daniel Webster, in the absence of his brother Ezekiel, was the teacher. In 1811, when only 17 years of age, he graduated at Harvard with the highest honors of his class. While an undergraduate he had the principal charge of a students' paper called the *Harvard Lyceum*. In 1812, he was appointed tutor at Harvard, and while thus employed, found time to prepare himself for the ministry. He was ordained pastor of the Brattle street church (Unitarian) in Boston, Feb. 19, 1814. As a preacher his career was brilliant, though brief. He resigned his pulpit at the end of 13 months, when not quite 21 years of age, having accepted the Eliot professorship of Greek literature at Harvard. To fit himself more completely for his new position, he went to Europe and studied for two years in the university of Göttingen, receiving the degree of PH.D. He then traveled extensively in England and upon the continent, making special visits to Athens and Constantinople. In England he made the acquaintance of the most eminent men of that day, Scott, Jeffrey, Romilly, and Davy. His range of study during his residence abroad was wide, embracing not only the branches included in his professorship, but a close examination of civil and political law, and of the European systems of government. Upon his return in 1819, he entered upon the duties of his professorship, delivering at the outset a course of lectures on ancient Greece, its architecture and ruins, which he afterwards repeated in Boston. During the period of his professorship, which continued till 1825, he became the editor of the *North American Review*, to which he contributed a great number of articles. In 1824, in the presence of gen. Lafayette, he delivered the Phi Beta Kappa oration at Harvard, winning new fame by his thoughtful and eloquent presentation of the theme, "Circumstances Favorable to the Progress of Literature in America." On the 22d of Dec. of the same year, he delivered an oration at Plymouth that kindled for him a wide popular enthusiasm. In the same year (1824) he was elected to congress from the Cambridge district. He was subsequently re-elected for four successive terms, making his whole period of service in that body 10 years. During this whole term he was a member of the committee on foreign relations, and in the 20th congress its chairman. He also served on the library committee, and generally on that for public buildings. He was also a member of some important select committees. His familiarity with the science of government and with the public questions of the time, united with his high literary qualifications, and his acknowledged power as a speaker, fitted him for great usefulness in committees and upon the floor. Some utterances are on record which may be taken as early indications of his subsequent position on the question of slavery. On the 9th of Mar., 1826, he brought upon himself the rebuke of Churchill C. Cambreling, member from New York, but a native of South Carolina, for these words: "The great relation of servitude, in some form or other, with greater or less departure from the theoretic equality of men, is inseparable from our nature. Domestic slavery is not, in my judgment, to be set down as an immoral and irreligious relation. It is a condition of life as well as any other to be justified by morality, religion, and international law." "Sir, I am no soldier. My habits and education are very unmilitary; but there is no cause in which I would sooner buckle a knapsack on my back, and put a musket on my shoulder, than that of putting down a servile insurrection at the south." In 1835, he was elected governor of Massachusetts, holding the office by annual re-election until 1840, when he was defeated by a single vote. In his first message to the legislature, Jan., 1836, he took occasion to refer in deprecatory terms to the anti-slavery excitement of that day, and, alluding to the anti-slavery papers, which were almost universally denounced as "incendiary," he said: "Whatever by direct and necessary operation is calculated to excite an insurrection among the slaves has been held by highly respectable legal authority an offense against the peace of the commonwealth, which may be prosecuted as a misdemeanor at common law." As the governor was known to have at that moment in his official possession, to be communicated to the legislature, the official demands of several of the southern states for the enactment by northern legislatures of laws to suppress the anti-slavery societies and journals, this portion of his message created much excitement in the state, and intense alarm in the anti-slavery party. Remonstrances in large numbers, against the adoption of the proposed legislation, were sent to the legislature, and the remonstrants were accorded a public hearing before a special committee. After a severe struggle, the contemplated restriction of the freedom of the press was averted, and no effort was ever made to enforce the governor's suggestion in regard to proceedings under the common law for the same object. While in congress, Mr. E. was a constant contributor to the *North American Review*, and among his papers published therein, was one in which he very ably and successfully controverted the South Carolina doctrine of nullification. In 1841, he was appointed by president Harrison minister plenipotentiary of the United States to Great Britain. The news of this appointment reached him in Italy, whither he had gone for the purpose of engaging in historical work. He hastened to obey the call of his country, and entered at once upon the discharge of his official duties. The relations of this country with England at that time involved our minister in very grave responsibilities, which Mr. E. discharged in a manner creditable alike to the country and to himself. Returning home in 1845, he reluctantly accepted the presidency of Harvard university, giving the next

three years to strenuous labor in behalf of his alma mater. After his resignation, he established himself in Boston with the purpose of entering upon literary tasks long postponed. He prepared a collected edition of his own orations and speeches, which appeared in 1850. He also edited a new edition of the works of Webster, at his special request, and prepared a memoir of the author. From such congenial labors he was next summoned to fill the place of secretary of state in the cabinet of president Fillmore, made vacant by Mr. Webster's death. He held this position only four months, retiring at the close of president Fillmore's administration; but during this time several important questions of state received his careful attention. Before leaving the department of state he was elected to the U. S. senate. Feb. 8, 1854, he made a powerful speech in the senate in opposition to the abrogation of the Missouri compromise of 1820, which prohibited slavery in all the territories ceded by France to the United States n. of the line of 36° 30'. The object of this abrogation was to open to slavery the territories of Kansas and Nebraska. Mr. Everett having been a conspicuous supporter of Webster and the compromises of 1850, was in a position to make his influence felt upon this new issue, but the measure was carried in spite of his eloquent remonstrances. His health failing, he resigned his seat in the senate in May and retired to private life. After recovering his strength, he devoted himself for several years to the work of procuring funds wherewith to purchase Mount Vernon, the home and burial-place of Washington, to be held in perpetuity as a place of resort and pilgrimage. He prepared an eloquent discourse upon the life and character of Washington, which he delivered nearly one hundred and fifty times in different places in the country, devoting the proceeds to this object. He also engaged to contribute an article weekly for one year to the *New York Ledger* for $10,000, to be paid by the proprietor to the Mount Vernon fund. The articles were afterwards republished in a volume entitled *Mount Vernon Papers*. Giving his time gratuitously and paying his own traveling expenses, he raised over $100,000 in all for the Mount Vernon fund. He subsequently, by similar methods, obtained considerable sums for several public charities. In 1860, he was nominated for vice-president of the United States, with John Bell of Tennessee for president, by a small remnant of the whig party, which had fallen to pieces under the growing anti-slavery sentiment of that period. The ticket received 590,631 votes from a total of 4,662,170. When the rebellion broke out in 1861, he took his stand promptly among those who determined to maintain the union at every hazard. His patriotic addresses at this crisis were of great service, influencing as they did a large body of conservative men, who, like himself, had done all in their power to discourage and resist anti-slavery agitation. His oration at the consecration of the national cemetery at Gettysburg, Penn., Nov. 15, 1863, was a production creditable alike to his patriotism and his high literary ability. In the great crisis of 1864, when Lincoln was re-elected, Mr. Everett's name headed the list of presidential electors of Massachusetts, and his vote for Lincoln was the last act in his political career. Jan. 9, 1865, he spoke in Faneuil hall in behalf of the needy and suffering citizens of Savannah, and on the following Sunday, the 15th, he died. He received the highest literary honors from the great English universities as well as from his alma mater. He was a corresponding member of the institute of France, and enjoyed the friendship of the greatest men of his time in Europe and America. A statue of him by Ball stands in the Boston public library, and another, by Story, in the public garden.

EVERGLADES, a peculiar swampy region in s. Florida, in Dade and Monroe cos., about 160 m. long by 60 m. wide, s. of lake Okeechobee. The E. consist of a vast number of small and low islands, separated by channels in which the water is usually shallow. The islands are covered with dense thickets of pines, palmettoes, vines, and tropical shrubs, and the soil is very fertile. The water in the channels is concealed by tall grass. The country is almost entirely wild, and abounds in small game. A few Seminole Indians still inhabit the region.

EVERGREENS are those trees and shrubs of which the leaves do not fall off in autumn, but retain their freshness and verdure throughout the winter, and perform their functions during more than one season. Evergreen leaves are generally of thicker and firmer texture than the leaves of deciduous trees and shrubs. They have also fewer pores or *stomata* (q.v.), and these confined to their under surface. Evergreen leaves are sometimes very small, as in firs and heaths; sometimes pretty large, as in rhododendrons, laureis, magnolias, etc. E., both trees and shrubs, have always been much sought after by the landscape gardener, and for purposes of ornament and shelter. Some orders of plants consist exclusively, or nearly so, of E., whilst in others they exist only as exceptional species. Most of the *coniferæ* are E., and the somber green of pines, firs, cypresses, etc., is a prevalent characteristic of northern scenery both in summer and winter; whilst the undiminished thickness of the foliage affords winter shelter to animals which could not so well exist in forests composed merely of deciduous trees. Holly and ivy are amongst the finest British E.; the box, privet, and different kinds of bay and laurel, rhododendron, phyllirea, myrtle, etc., are also familiar to every one. As instances of genera in which some species are evergreen and others deciduous, may be mentioned barberry and cytisus. Many fine new ornamental E. have recently been introduced. As suitable for imparting a lively appearance, boughs

of E. are largely employed in Great Britain to decorate the walls of public places of assemblage, triumphal arches, etc., on festive occasions.

EVERGREENS (*axte*). The more plentiful and important of these beautiful trees and plants native in the United States are given in the following list:

White Spruce	*Abies alba.*
Hemlock	*Abies Canadensis.*
California Spruce	*Abies amabilis.*
Douglass Spruce	*Abies Douglassii.*
Mexican Spruce	*Abies Mexicana.*
Black Spruce	*Abies nigra.*
Red Spruce	*Abies rubra.*
Sabine's California Spruce	*Abies Sabini.*
California White Cedar	*Libocedrus decurrens.*
White Cedar	*Cupressus thyoides.*
Great Coned Cypress	*Cupressus macrocarpa.*
Mexican Cypress	*Cupressus Mexicana.*
Red Cedar	*Juniperus Virginiana.*
Great Flowered Magnolia	*Magnolia grandiflora.*
Balsam Fir	*Abies balsamea.*
California Noble Fir	*Abies nobilis.*
White Pine	*Pinus strobus.*
Yellow Pine	*Pinus mitis.*
California Yellow Pine	*Pinus brachypterus.*
California Nut Pine	*Pinus edulis.*
Jersey Pine	*Pinus inops.*
Scrub Pine	*Pinus Banksiana.*
Pitch Pine	*Pinus rigida.*
Long-leafed Pine	*Pinus australis.*
Pond Pine	*Pinus serotina.*
Spruce Pine	*Pinus glabra.*
Mountain Pine	*Pinus pungens.*
Loblolly Pine	*Pinus tæda.*
Lambert's Californian	*Pinus Lambertiana.*
Red Pine	*Pinus resinosa.*
Bald Cypress	*Taxodium distichum.*
American Yew	*Taxus baccata Canadensis*
Florida Yew	*Taxus Floridana.*
American Arbor Vitæ	*Thuya occidentalis.*
Giant Arbor Vitæ	*Thuya gigantea.*
California Torreya	*Torreya Californica.*
Great California tree	*Sequoia gigantea.*
Redwood	*Sequoia sempervirens.*

EVERLASTING FLOWER, the popular name of certain plants, the flowers of which suffer little change of appearance in drying, and may be kept for years without much diminution of beauty. They are plants of the order *compositæ*, having their flowers (heads of flowers) surrounded with an involucre; the scales of which resemble the petals of a corolla, but are rigid, membranous, and contain little moisture. Some species of cudweed (q.v.) (*gnaphalium*) are often called E. F., and the other plants which bear the name belong to nearly allied genera, but particularly to the genus *helichrysum*, which contains a great number of species, mostly natives of Africa. *H. arenarium* is frequent on dry sandy soils in many parts of Europe and the central latitudes of Asia. It is covered with a gray felted down, and has yellow flowers, which, when rubbed, emit a faint aromatic odor. It is often worn on the continent of Europe as an ornament in the hat, particularly by wagoners. *H. angustifolium* and *H. Stœchas*—shrubby species, natives of the s. of Europe—have larger yellow flowers. Some of the species have a powerful and pleasant aromatic odor. No species of *helichrysum* is a native of Britain. Several kinds of E. F. are frequently to be seen in our gardens, others in green-houses. The French call them *immortelles*, and in France they are often woven into circular wreaths, and placed beside recent graves, as emblems of immortality.

EVERSLEY, Viscount, ex-Speaker of the house of commons. CHARLES SHAW LEFEVRE, b. in 1794, is descended maternally from the Lefevres who came to England from Rouen on the revocation of the edict of Nantes. He was educated at Winchester and Trinity college, Cambridge, called to the bar at Lincoln's Inn in 1819, entered parliament in 1830, as a member for Downton, and represented Hants from 1831 to 1857. In 1839, he was chosen speaker of the house of commons; and re-elected in the parliaments of 1841, 1847, and 1852. He retired from the office in 1857, with a peerage and a pension of £4,000 a year. During the eighteen years of his speakership, he suggested and carried out many improvements in the forms and procedure of the lower house, tending to the dispatch of business. Tall, and dignified in person, affable and accessible to the younger members, and profoundly versed in the laws of debate and practice

of the house, he was admirably qualified, by nature and training, to be "first commoner of England."

EVESHAM, originally EOVESHAM, a municipal and parliamentary borough in the s.e. of Worcestershire, on the right bank of the navigable Avon, 15 m. s.e. of Worcester. It lies in a beautiful and fertile vale, and has some manufactures of agricultural implements. Pop. '71, 4,888. E. sends one member to parliament. An abbey was founded here about 700.

EVICTION, in the law of Scotland, is the dispossessing one of property, whether in land or movables, in virtue of a preferable title in the person of him by whom the eviction is made. The same expression is used in England as to property in land; but where the tenant is merely deprived of possession, it is called ouster.

EVIDENCE, LEGAL. Evidence is either parol or written, the former consisting of the statements of witnesses appearing personally in court, and which statements must be attested by an oath or solemn declaration; the latter consisting of records, deeds, and other writings.

A distinction—popular rather than legal—is commonly drawn between *direct* and *circumstantial* evidence. Evidence is said to be direct when the proof depends on the testimony of persons who swear to the fact in dispute as matter of personal knowledge: when the witnesses only swear to other facts from which the fact at issue may be inferred, the evidence is called circumstantial. The latter kind of evidence is usually regarded as inferior in value to direct. Yet it is sometimes held that circumstantial evidence may be the more trustworthy; for either the witnesses may be unaccountably mistaken, or may have designed to deceive, whereas, as Paley said, "circumstances cannot lie."

The tendency, both in England and Scotland, of late years, has been to abolish all restrictions on the admissibility of witnesses, and to bring the rule practically to what Blackstone stated it to be in theory, viz., "all witnesses that have the use of their reason are to be received and examined." The ground on which witnesses were formerly excluded was untrustworthiness, arising either from the character of the witnesses or their interest in the suit. Under the former head fell those who were legally infamous (q.v.); whilst the latter included, first, the party to the suit himself, and then all who were connected with him by the ties of family, or even of business, in any appreciable degree. Gradually, however, it came to be seen that, though witnesses subject to these objections were less valuable than others to the party adducing them, it by no means followed that their testimony was of no value at all, and that the safer course in all cases was to examine them, and then to allow their testimony to be invalidated by proof of their interest in the cause direct or indirect, or of their having been convicted of such crimes as to render it unlikely that they should speak the truth. The objections have thus become objections not to the admissibility or competency, but to the credibility of witnesses. The first of the very important statutes by which these changes were effected was 9 Geo. IV. c. 32, which permitted Quakers and Moravians to substitute a solemn affirmation for an oath; admitted the party whose name had been forged as a witness in prosecutions for forgery; and provided that no misdemeanor (except perjury) shall render a party an incompetent witness after he has undergone the punishment. Then came the Scotch act 3 and 4 Vict. c. 59, afterwards referred to, and the English act 6 and 7 Vict. c. 85, which provided that no person offered as a witness shall hereafter be excluded, by reason of incapacity from crime or interest, from giving evidence either in person or by deposition on any issue or inquiry civil or criminal, but shall be admitted notwithstanding he may have an interest in the matter in question, or in the event of the trial or proceeding, and notwithstanding that he may have been previously convicted of any crime or offense. The same principle was extended by 14 and 15 Vict. c. 99 to the parties to a cause, who are not only competent, but compellable to give evidence on behalf of either or any of the parties—subject only to exception where the question tends to criminate the person examined, or where one (now altered) sued for breach of promise of marriage, or any action or proceeding instituted in consequence of adultery. By 16 and 17 Vict. c. 83, the former statute, 14 and 15 Vict. c. 99, was amended to the effect that the husband or wife of the party shall be in the same position with the party himself, subject only to these exceptions—first, that the husband or wife cannot give evidence for or against each other in criminal proceedings (but now they may in suits for adultery), and that they cannot be compelled to disclose matters which they have learned by communications from each other during the marriage. The statutes by which the corresponding changes were effected in Scotland were 3 and 4 Vict. c. 59, 15 and 16 Vict. c. 27, and 16 and 17 Vict. c. 20.

The oath (q.v.) to "speak the truth, the whole truth, and nothing but the truth," is administered to witnesses in England on the New Testament; in Scotland, holding up the right hand. Quakers and all conscientious persons, of whatever religious denomination, who object to the use of an oath, as formerly observed, make a solemn affirmation (q.v.); and persons who are foreigners are sworn, or otherwise bound over to speak the truth, by such forms as are conceived to be appropriate to their respective creeds. The test of the amount of religious belief which will suffice to render a witness admissible, has been generally considered to be a belief in future rewards and punishments;

but there is no decision which fixes the point, and in England, belief in a God, and that divine punishment will be the certain consequence of perjury here or hereafter, is enough. To obviate captious objections, the sacredness of oaths was secured by 1 and 2 Vict. c. 105, which provides that all persons shall be bound by the oath administered in the form and with such ceremonies as such persons shall declare to be binding.

It is a general rule of the law of evidence, that a witness is not bound to criminate himself, and he may consequently decline to answer any question that tends to expose him to punishment as a criminal, or to penal liability, or to forfeiture of any kind. If the effect of the question be merely to establish that he owes a debt, or is otherwise subject to a civil suit, the exception will not hold, and he will be bound to answer it (46 Geo. III. c. 37). The rule in England is, that a counsel, attorney, or solicitor is not bound, or even entitled, to divulge the secrets of the cause with which he has been intrusted; and the recent Scottish act 15 and 16 Vict. c. 27, s. 1, preserves the same exception with reference to agents who shall at the time when so adduced be acting in that capacity. Neither can official persons be called upon to disclose matters of state, the publication of which might be prejudicial to the community. All other professional persons, however—lawyers not engaged in the cause, physicians, surgeons, and divines, must divulge all secrets relevant to the issue with which they have become acquainted, even in the strictest professional confidence. See CONFESSIONAL. Neither will a servant nor private friend be allowed to withhold a relevant act, though of the most delicate nature.

One witness in England is sufficient in law, unless in the case of treason, if juries believe him, and in long chains of evidence it is often impossible that more than one witness should be adduced to make out some of the links of it. In general, however, there will be some fact or circumstance which will act as a supplementary adminicle, if the testimony be reliable; and it is this fact which has rendered the practical effect of the opposite rule, which demands two witnesses, in Scotland, not very different. The want of a second witness is usually supplied by a witness to circumstances which are corroborative of the evidence of the first; and where the one witness is not so corroborated in England, he will rarely be believed. It is a rule that none but the best evidence shall be adduced, which means that secondary shall not be substituted for primary evidence where the latter is accessible; a rule founded on the presumption that such a substitution is probably prompted by a sinister motive. This rule applies to written as well as oral testimony, and excludes copies of documents, just as it excludes the "hearsay" of witnesses. See OATH, JURY, WITNESS, DEED, TESTING, etc. The best works on evidence in English are Taylor (English), Greenleaf (American), and Dickson (Scotch).

EVIDENCE (*ante*), in law, embraces all statements which a court permits or requires to be made by witnesses in relation to matters of fact pertaining to the case on trial, and all documents produced for the inspection of the court. The former is distinguished as parol, the latter as written evidence. Again, evidence is either direct or circumstantial. When a witness testifies to a fact in issue from his own personal knowledge, his evidence is direct; when he swears to other facts, from which the existence of the fact at issue is inferred, it is circumstantial. Generally direct evidence has more force than circumstantial, though the latter is sometimes of such weight as to carry conviction to a court or jury. Both are to be taken with some allowance for possible mistake or falsehood on the part of the witness. Evidence must be relevant to the issue, though it may embrace incidents in themselves irrelevant, but which are among the necessary surroundings of the fact to be proved. The contents of a document must be proved by the document itself if it be accessible; if not, then by a certified copy, or by oral evidence; the law requiring the "best evidence" procurable in each case. When a contract has been reduced to writing, parol evidence cannot be admitted to prove its contents; still less can any variations of its terms be thus proved. Courts presume, until the contrary is proved, that a document was executed on the day of its date. Alterations and interlineations in a deed are presumed to have been made before execution, but in respect to wills the rule is reversed. When the law requires an instrument, e.g., a will, to be attested, it cannot be used in evidence unless one attesting witness be called to prove its execution if such a witness be alive and capable of giving evidence. If there be no such witness, then the signature of at least one attesting witness, and of the person executing the deed, must be proved to be in their respective handwritings. A will thirty years old is held to prove itself; that is, there is a presumption in favor of its validity. The burden of proof lies on the person who asserts the affirmative. A presumption on the part of a court can be set aside only by evidence, and the burden of proof rests upon the party making denial. In criminal cases—in trials for murder, for instance—malice is presumed and requires to be rebutted by evidence. A person who has not been heard of for seven years, unless the circumstances are such as to account otherwise for his absence, is presumed in law to be dead. His wife may marry again without liability to punishment for bigamy. The effect of presumption is to establish against a party a conclusion which stands until he disproves it. In many states uninterrupted, undisputed possession for 20 years is held to establish a title to real estate. In some states a shorter period is sufficient. By the common law, if a wife commits a felony, other than murder or treason, in the presence of her husband, she is

not criminally liable, it being assumed that she was under coercion. This rule is greatly restricted in practice in the United States. It is a rule of law, to which, however, there are some qualifications, that a witness cannot testify to what he has heard another say, but to only what he himself knows. One of the exceptions to this rule is that the dying declarations of a murdered person as to the causes of his death and the person who committed the murder may be given in evidence by one who heard them. If a witness testify in a trial, his evidence may be proved in a subsequent trial. When doubts arise respecting the boundaries of land, or the pedigree of persons, and the question is material to determine the issue before the court, traditional evidence—in other words, declarations made long ago by persons supposed to have had knowledge of the subject—is sometimes admitted. The ordinary witness is confined to statements of fact; he cannot give an opinion, or state the inferences he draws from the facts within his knowledge. An "expert"—one skilled in some art or profession—is allowed and even required to give opinions as to the significance of facts whose meaning is not fully understood by a court or jury; e.g., a chemist may testify as to the effects of certain poisons upon the human system, or a surgeon may say whether in his opinion there has been malpractice in treating a wound. For reasons of public policy, the confidential communications between an attorney and client and between a husband and wife are excluded. "Secrets of state" and the deliberation of judges and juries are exempt from judicial investigation. A witness within the jurisdiction of the court is required to attend in person; if he be beyond the jurisdiction his testimony is taken by commission. Formerly parties to an action and others interested therein were not allowed to be witnesses, but they are now generally admitted, it being assumed that courts and juries will give due weight to the temptation which such witnesses may be under to swerve from the truth in their own interest. Persons of a defective understanding, or who are supposed to be insensible to the obligations of an oath, are held to be incompetent as witnesses. Persons convicted of an infamous crime are generally excluded. The tendency of law at present, however, is to widen the range of evidence as far as possible, and to regard many of the former grounds of exclusion as concerning not the admissibility but only the credibility of a witness. The party calling a witness is not allowed to ask him "leading questions"—i.e., questions which suggest their answers. The other party on cross-examination is not bound by this rule. A witness is not required to answer questions, when in doing so he must criminate himself. A witness may be impeached by proving that his reputation for truth and veracity is bad.

EVIDENCES OF CHRISTIANITY. Christianity is the religion growing out of a divine revelation the giving of which, in successive stages, extended from a remote period in the past to about one hundred years after the birth of Jesus Christ. From the beginning of the revelation to the present time it has been engaged in severe conflicts with the mightiest forces, and with whatever immediate outward result, it has maintained its hold on the human mind and has advanced in power. Thus the conflicts themselves become important factors in the strength of the evidences by which the authority of the revelation is upheld. 1. Moses, as a bearer of a part of the revelation, was brought into conflict with the Egyptians and inflicted on them, instrumentally, without human help, judgments and sufferings, the result of which was the deliverance of the Israelites from bondage, and the memorial of which is the Passover, instituted at the time and observed to this day by the Jews scattered over the world. 2. Moses came also into conflict with the barrenness of the wilderness, in providing for the sustenance of the Israelites, and with their turbulence and rebellion during their sojourn and wanderings there. The memorials of these conflicts are the wilderness itself, the law given there, and the Pentateuch written there. 3. Having traversed the wilderness, Moses, Joshua, and Israel were involved in a conflict with the nations of Canaan, on both sides of the river Jordan, the result of which was the conquest of the land; and the memorial of it is the land itself, illustrated by the book of Joshua, which (as has been said) bears a relation to Palestine as conquered by the Israelites, similar to that which doomsday book bears to England as conquered by the Normans. 4. Passing by minor conflicts between the Jews and the nations around them, we take notice of the great expedition of Sennacherib, king of Assyria, against them, and of its overwhelming defeat; to both which events the harmonious witnesses are the written records of the Jews and the sculptured records of Sennacherib. 5. Nebuchadnezzar, king of Babylon, desolated the land of Canaan, destroyed Jerusalem, burned the temple, and carried the Jews captive. The result of this judgment was their deliverance from idolatry, and the memorial of it is the book of Daniel with its splendid prophecies. 6. Cyrus, the conqueror of Babylon, might also have overwhelmed the Jews, but having been shown the prophecy of Isaiah, written 150 years before, in which he was mentioned by name and his success foretold, his spirit was stirred up to restore them to their own land. The memorials of the restoration were the temple rebuilded at Jerusalem and the synagogues erected throughout the land. 7. Alexander, in his rapid career of conquest, appeared before Jerusalem in anger against the Jews because they placed obstacles in his way. But when he was shown the prophecies of Daniel concerning the king of Grecia who was to conquer Persia, his anger giving way to joy, he treated the Jews kindly and placed many of them in the new cities that he built. Memorials of his change of feel-

ing towards them were furnished by Jewish synagogues built in the Greek cities and the Jewish Scriptures translated into the Greek tongue. 8. Antiochus the great, one of Alexander's successors, seized Jerusalem and desecrated the temple by offering heathen sacrifices therein. His course awakened the zeal of the Jews and imparted new life and purity to their religion. A memorial of this reformation was furnished by the restoration of royal government to the Jews. 9. The Romans next obtained entrance into Jerusalem and established their power over the land. For a time they gave regal and vice-regal authority to Herod and his successors. Afterwards they made Judea a province and continued to hold it until, on the revolt of the Jews, they destroyed the city and the temple, and sold the inhabitants as slaves. In the midst of this Roman domination the crowning event of human history occurred—THE ADVENT OF JESUS CHRIST THE SON OF GOD; and the still-enduring memorials of it are Jerusalem trodden down by the Gentiles and the going forth out of it of Christianity, strictly so called, unaided by physical power, to gain possession of the world. 10. Its first conflict, in this form, was sustained by Jesus himself against the chief forces of the Jews among whom he came. His visible power consisted in a holy and unselfish life, in words of instruction surpassing all that men have ever spoken, and in beneficent works transcending all that men have ever wrought. The first result of this conflict was, apparently, his defeat by the Jews, for, aided by the Romans, they accomplished the death of Jesus and his burial in a sealed and guarded tomb. But the conflict was renewed by his followers, who offered themselves as witnesses of his resurrection and produced conviction in the minds of thousands of Jews, while also they aroused hostility in the hearts of many others. As the preaching of "Jesus and the resurrection" spread into other cities and lands, the conflict with Jews was continued, producing, as before, conviction in many minds and also hostility in many hearts. And to this day, Christianity and the Jews are arrayed against each other in many lands. 11. Its next conflict was with heathenism in union with the state. Proclaimed, almost immediately, as a gospel for the nations, it was opposed by the adherents of all idolatrous religions rallying against it as a common enemy, and by the governing classes, whose jurisdiction in religious matters (as they thought) it usurped. Yet it prevailed from city to city and from land to land. Heathen temples were almost deserted, and the fires of sacrifice on their altars went out. Trophies of the victory were furnished by the acts and writings of the apostles, by the planting and growth of churches, the joyful death of martyrs, the courage of confessors, and the argumentative defenses of learned men. If at the moment of triumph, in the council of Nicæa, the presence of the emperor Constantine—assuming, in some sense, to be the head of the assembly—was a fatal mistake, introduced from the heathenism which he had as yet scarcely left, let it not be forgotten that many of the bishops who rose to receive him were marked with bodily mutilations or scars, the tokens of their fidelity to Christ. 12. The next conflict of Christianity was with philosophy. While it contended only with Jewish and idolatrous rites, philosophers treated it with contempt and easily remained ignorant concerning it. But in its advance it awakened the hostility of Celsus, Porphyry, and others, who attacked it as false and mischievous; and, on the other hand, Justin Martyr, its first great defender among uninspired men, wore a philosopher's robe. From this point forward Christianity continued to be opposed by many in the ranks of philosophers and to be corrupted by the admixture with it of the philosophic opinions prevalent around it. 13. Christianity contended, also, with barbarism rude and strong. In the ages that followed the inroad of the northern tribes on Rome this religion was the only power that held them in check, tempering their fierceness and finally subduing them to the obedience of faith. Yet here also, as in its contests with Judaism, paganism, and philosophy, it was itself corrupted by admixture with the opinions and habits of those who received it. 14. Its next great conflict was with Mohammedanism. The Saracens were overrunning Christendom with the sword and the Koran from the east and south, but in the west the barbarians who had become Christians broke their power and poured the forces of Europe upon the Holy Land. And from those times to the present the "eastern question," in some form, has arrayed Christian Europe against Mohammedan rule. 15. The next great conflict was in Christendom itself. The corruptions which had been introduced from the worldly power of Rome, from heathen idolatries, philosophic opinions, and barbarian superstitions, accumulated and grew until Christianity became, in many respects, a baptized heathenism. But from itself, through the teaching of the recovered Scriptures, its own reformation was commenced and was followed by a conflict more extended and severe than any which had been waged against it before. And after more than three centuries and a half this conflict has not ceased. 16. Its next conflict, partly occasioned by the errors of Romanism and greatly aggravated by them, has been with infidelity in various forms. The Italian infidels of the 16th c. were witnesses against themselves by their hypocrisy and vice; the English infidels of the 17th and 18th centuries were driven back by many earnest writers; the French infidels of the 18th c. hastening on the revolution and greatly increasing its honors, condemned their own religious errors by their political crimes; the German infidels of the 19th c., striving to dissolve Christianity into fable by the power of criticism, have left its foundations as solid as before. 17. The great conflict of Christianity in the present century is with the gigantic forces of modern heathenism. Having commenced the work

in the closing years of the last century, it has ever since steadily advanced with wiser counsel, more deliberate purpose, more thorough work, more liberal expenditure, and more enlarged success, to the overthrow of all false religions. A system of religion which has been contending so long against all these mighty forces; whose progress can be traced through 3,800 years, from the point where one man held its revelation as a promise of blessing for all the world, to the present time, in which millions enjoying the blessing themselves are pressing on the fulfillment among all nations—that system of religion must have more than human strength, it must be from God. The evidences by which its divine origin is established are co-extensive with human observation, thought, and history. A portion of them may be classified as follows:

I. EXTERNAL PROOFS. 1. Miracles wrought by Moses, Christ, and the apostles. 2. Prophecies already fulfilled and yet to be fulfilled; concerning Nineveh, Babylon, Tyre, Egypt, Petra, Bashan, Moab, Philistia, Damascus; the Babylonian, Persian, Grecian, and Roman empires: concerning the Jews, their deliverance from Egypt, entrance into Canaan, captivity in Babylon, restoration to their own land, destruction of their temple and capital city, with the long period during which it would continue trodden down by the nations, their wanderings and sufferings in many lands: concerning the Christian apostasy, the seven churches of Asia, and the unfolding of human history to the last days. 3. Historical testimonies to the genuineness and authenticity of the Scriptures.

II. INTERNAL PROOFS. 1. *Doctrines.* Concerning the being, perfections, and government of God; the origin of the worlds; the creation, nature, fall, sinfulness, redemption, and immortality of man. 2. *Moral and religious precepts.* The ten commandments; sermon on the mount; ethics of the epistles. 3. The person, character, and work of Jesus Christ; and the unity of all the Scriptures in him as the divine human Savior. In the Old Testament a deliverer is promised who would be one of the human race, yet would perform a work beyond human power; would descend from Adam, Abraham, Isaac, Jacob, Judah, David; would be born in Bethlehem, of a virgin mother, yet is eternal, the mighty God and Prince of Peace; would be subjected to humiliation, sorrow, suffering, death; and, because of these things, would be raised from the dead and exalted to the right hand of God as the Savior of men. The New Testament exhibits Jesus Christ as descended, in human nature, from Adam, Abraham, Isaac, Jacob, Judah, David, and born in Bethlehem of the virgin Mary; yet as in his divine nature the Son of God, Emmanuel, God with us: as subjected to humiliation, suffering, and the cursed death of the cross; yet rising again the third day and filling the New Testament, the church and heaven with his glory as God manifest in the flesh. This exhibition of Christ in all the Scriptures is a demonstration that he is the divine Savior and that they are inspired of God.

III. Experimental proof (combining both the external and internal) furnished by the rise and continued progress of Christianity and its effects on the character, condition, and hopes of mankind. Christianity contains a revelation from the living God, was founded by a living Savior, was embraced, through the power of the Holy Spirit, by living men, so that Christians existed before organized Christian churches, before the Christian Scriptures, before Christian customs, laws, or nations. Successive generations of Christians have been continued on the earth and have furnished living evidences of Christianity. The aggregate of Christian life, character, work, and influence throughout the world from the beginning to the present time is, to-day, the culmination of the proofs that Christianity is divine. See CHRISTIANITY, *ante.*

EVIL may be generally defined as that which is opposed to the divine order of the universe. It requires only a superficial observation to perceive, that there are many apparent exceptions to the pervading harmony and happiness of creation: there are convulsions in the physical world; there are suffering, decay, and death throughout the whole range of organic existence; and the appellation of E. is commonly applied to such phenomena. In the face of the human consciousness, such phenomena appear to be infractions of the general order and good, and it pronounces them *evil.* How far the internal feeling of wrong has been quickened and educated by such outward facts, it would be difficult to say, but, beyond doubt, they have exercised upon it a powerful influence. Every form of religion testifies to the recognition of evil in the external world, and superstition in all its shapes mainly rests upon it.

But it is in the sphere of moral life alone that the conception of E. can be said to hold good. After the light of science has explored the secrets of nature, and shown how all its apparent anomalies are merely manifestations of a comprehensive harmony, the idea of E. is dispelled from the material and merely organic creation. "Whatever is, is best," is seen to be everywhere the law of this creation. There remains, however, the ineradicable feeling of E. in human life and manners and history. There is in the moral consciousness of man a sense of violated order, of transgression of divine law, or what is called *sin*, which is *evil* in its essential form. This fact of E. is everywhere appealed to by the Christian religion; it is the aim of this religion to deliver men from its power and misery. Every ethical and judicial code is based upon its recognition, and is designed to protect human society from its injurious consequences. It cannot be better or more clearly defined than in the language already given, viz., the transgression of the divine law revealed in conscience and in Scripture.

The question of the *origin of evil* has been greatly discussed, and received various answers. The simplest and most direct of these answers is that which maintains a double origin of things, or a system of *dualism*. This conception lies at the bases of many forms of religion; it may be said to be the fundamental conception of all mere nature-religions. Interpreting the obvious appearances of nature, they embody in divine personalities its contending manifestations of light and darkness, benignity and terror. The opposition of Ormuzd and Ahriman in the old Zoroastrian faith is one of the most conspicuous examples of this religious dualism. Manicheism, which spread so widely in the 4th and 5th centuries, and the Syrian gnosticism from which it sprung, are also historical illustrations of the same principle.

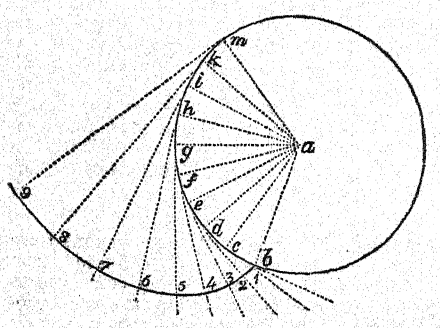
The dualistic theory of the origin of E., however, could not obviously maintain itself with the advance of speculation and the spread of Christian truth. It was no less clearly a postulate of the cultivated reason than a dictate of divine revelation, that the world proceeded from One absolutely Divine Creator, holy and good, of whom, and through whom, and to whom are all things. It was necessary, therefore, to reconcile the appearance of E. with this fundamental admission

The doctrine of the fall, especially in the later form of development which connects it with the existence of a devil or evil spirit, tempting man in the shape of a serpent, was supposed to explain the appearance of E. in human history. Being tempted of the devil, man sinned, and so fell from his obedience to the divine law. This is the doctrine of orthodox Christian theology, and the answer which it gives to the inquiry, how sin came into the world? And many minds never think of carrying the inquiry further. It is clear, however, that this explanation of the historical origin of E. leaves the question of its real and absolute origin unsettled. The devil being assumed as the cause of man's sin, the further question arises, whence the devil? Is he an absolute personality? in which case we are landed in the old theory of dualism; or is he, according to the traditionary Christian conception, a fallen angel? in which case the question just returns, whence the spring of E. in him? There is no real explanation gained by this removal of the question; it is still the same difficulty—whence the origin of E. in the creation of an all-perfect being, almighty as well as all-wise and good?

Speculation may please itself with ingenious answers to this question, but in truth it admits of no satisfactory solution. Some, for example, have argued that E., like darkness or cold, is an indispensable element of alternation or contrast in human life. All individual reality is only the product of opposite forces working together. Character could only arise from the interaction of opposing ethical influences of good and evil. In nature, we have attraction and repulsion, rest and motion, positive and negative electricity; why should it be different in the sphere of morals? Here, too, there must be polarity. Good can only exist in contradistinction to E.; the one no less than the other is necessary to constitute the drama of human life and history. Others, again, have argued, that E. is the result of what is called metaphysical imperfection. God alone can be perfectly good. The creature, in its very nature, is limited, defective; and E. is nothing else than the evidence of this limitation in man. It is not something real or positive, but only a privation. It is in morals what cold and darkness are in physics, a pure negation. Thus have argued such profound thinkers as Augustine and Leibnitz. But it requires but little penetration to see that such arguments, however ingenious, and so far well founded, do not meet the essential difficulty of the problem. If E. be, according to such views, a necessary element of human life, in the one case, in order to develop its activity, in the other case, as clinging to its creaturely limitations, then plainly it is not, in the orthodox sense of the word, *evil*. It is not, and cannot be a contradiction of the true idea of human life, and at the same time a necessary element of it. Whatever necessarily belongs to life, must help its true development, and not injure and destroy it; must be *good*, in short, and not *evil*. Such theories, therefore, only solve the problem by eliminating the fact. The origin of E. must remain forever inscrutable; nor is it wonderful that it should. It is only in its ultimate sense conceivable as a quality of moral freedom, and moral freedom in man or any created being is a profound mystery. It is something which "we apprehend, but which we can neither comprehend nor communicate."

EVIL, KING'S. See SCROFULA.

EVIL EYE. Both in ancient and modern times, the belief that some persons have the power of injuring others by looking upon them, has been widely diffused. The Greeks frequently speak of the *ophthalmos baskanos* (or E. E.), which they conceived to be especially dangerous to children; and the Romans used the verb *fascinare* to express the same fact. Pliny speaks—not on his own authority, however—of "those among the Triballians and Illyrians, who with their very eyesight can witch (*effascinent*), yea, and kill those whom they look wistly upon any long time;" and Plutarch states, on the authority of Philaretus, that "the Thybiens who inhabited Pontus were deadly, not only to babes, but to men grown, and that whomsoever their eye, speech, or breath would reach, were sure to fall sick, and pine away." Menalcas, in Virgil (*Ecl.* iii. 102), also complains that some E. E. has fascinated his young lambs—



Nescio quis teneros oculus mihi fascinat agnos.

The principal amulet used by the ancients was the *phallus* or *fascinum*, as the Romans

called it, which was hung round the neck of children. Of course, this superstition, like all others, flourished in Europe during the middle ages. See Reginald Scot's *Discovery of Witchcraft;* the *Opusculum de Fascino* of John Lazarus Gutierrez, a Spanish physician, published in 1653; and the *Tractatus de Fascinatione* of John Christian Frommann, a physician of Saxe-Coburg, published in 1675. In the British isles, also, the belief in the power of the E. E. is of old date, and is by no means dead, at least in Ireland and the Highlands of Scotland. In these countries (as elsewhere), it was once a very common superstition that cattle were subject to injury in this way. Witches had the power to a malignant degree; and various charms, such as twining mountain-ash among the hair of the cow's tail, were used to avert or destroy their noxious influence. In the east it was and is no less prevalent. The Persians have various methods of discovering the special kind of fascination by which a person is afflicted; and Dallaway, in his *Account of Constantinople* (Lond. 1797) affirms that "nothing can exceed the superstition of the Turks respecting the E. E. of an enemy or infidel. Passages from the Koran are painted on the outside of the houses, globes of glass are suspended from the ceiling, and a part of the superfluous caparison of their horses is designed to attract attention, and divert a sinister influence." Hobhouse, in his *Travels*, bears equally conclusive testimony to the prevalence of this superstition in the Turkish empire, not among Mohammedans only, but also among Christians; while Lane, in his *Modern Egyptians* (1833), gives an account of the precautions taken by the Egyptians to avoid the influence of evil eye. The American Indians partake of the same belief; and it is not improbable that if the matter were still more profoundly investigated, it would be found that every nation that exists or has existed, with anything like a developed system of superstition, believes or has believed in the reality of fascination in some form or other.

The universality of this superstition goes far to prove that it has what may be called a *natural* origin; and, indeed, when we consider that the *eye* is the most expressive organ of the soul or mind of man, that through it are shot forth, as it were, into the visible world of the senses, the hidden passions, emotions, and desires of our nature, we will not wonder that in the "times of ignorance," when men could give no rational or scientific account of almost any physiological phenomena, if connected with psychology, the eye should have been superstitiously imagined to be a center of malignant influence. The eye is, in point of fact, as potent as superstition dreams: the error lay not in the recognition of its power, but in explaining the mode of its operation. The person who felt himself under the spell of a powerful gaze, was too agitated to calmly consider the cause of his terrors, and attributed to another results for which he himself was mainly responsible. It was really he that gave to the eye of his fellow-creature its baleful influence; and he quailed less before the force of character which it indicated, than before the fearful fancies with which his own timidity had invested it. For this disease, wherever it has existed, or does yet exist, there is no cure but that solid culture of the understanding from which comes a true strength of will and brain. See Fascination by Serpents.

Evolute and Involute. See Curvature and Osculating Circle. The evolute of any curve is the locus of the center of its osculating circle, and, relative to its evolute, the curve is called the involute. This is the simplest definition that can be given of an evolute and involute, which are relative terms. There is another, however, which may represent the relation of the curves more clearly to those who are not mathematicians. If on any curve a string be closely wrapped, and if the string be fastened at one of its ends, and free at the other; and then if we unwind the string from the curve, keeping it constantly stretched, the curve which would be traced out by a pencil fixed to the free end of the string, is called the involute of that from which the string is unwound, and relative to it, the latter is called the evolute. It is clear that the involute might otherwise be described by fastening a string at one extremity of the evolute, and wrapping it thereupon, keeping it always stretched. From either definition, it is clear that a normal to the involute at any point is a tangent to the evolute, and that the difference in length between any two radii of curvature to the involute is equal to the length of the arc of the evolute intercepted between them. The nature of evolutes was first considered by Huyghens, who showed that the evolute to a common cycloid is another equal cycloid, a property of that curve which he employed in making a pendulum vibrate in a cycloid. To describe the involute of a circle, proceed as follows: Let *a* be the center of the circle, and *b* the extremity of the string to be unwound from its circumference. Divide the circle, or part of the circle, according to the length of curve required, into any number of equal parts, as *c*, *d*, *e*, etc.; through these, from *a* draw radial lines; from

the points where these touch the circle, draw, at right angles to the lines *ac*, *ad*, etc., other lines, as in the diagram. With the distance *cb* as radius, from the point *c*, describe an arc *b*1, cutting the line *c*1 in 1. From the point *d*, with *d*1, describe an arc 1 2, cutting the line *d*2 in 2. From *e*, with *e*2, describe an arc 2 3, cutting the line *e*3 in 3. With radius *f*3, from *f*, describe an arc 3 4, cutting *f*4 in the point 4. Proceed in this way, describing arcs which pass through the points 5, 6, 7, 8, and 9. The involute will thus be formed.

EVOLUTION. See SPECIES, (*ante*).

EVOLUTION AND INVOLUTION, algebraical terms, the former signifying *the extraction of roots*, and the latter *the raising to powers*. When any number is multiplied by itself, the product is called its square, or second power. If we multiply the square by the number again, we get the cube, or third power; and so on. This process is called involution. Evolution is the inverse process, by which a number being presented, we may ascertain a particular *root* of it, say the fourth; or that number which, being multiplied into unity a particular number of times, say four times, the product will be the number presented. Both subjects will be found treated in all algebraical text-books. Evolution is more particularly considered under the head EXTRACTION OF ROOTS.

EVOLUTIONS, in military matters, are the movements of troops in order to change position. The object may be to maintain or sustain a post, to occupy a new post, to improve an attack, or to improve a defense. All such movements as marching, counter-marching, route-marching, changing front, forming line, facing, wheeling, making column or line, making échelon or square, defiling, deploying, etc., come under the general heading of evolutions. More minute descriptions of these and other motions will be given under TACTICS, MILITARY AND NAVAL. Other things being equal, the best E. are those which occupy least time and least space. The word evolution equally applies to the movement of ships in a fleet.

EVORA (ancient *Ebora*), a city of Portugal, capital of the province of Alemtejo, and, after Coimbra, and perhaps Thomar, the most interesting city in the country, is beautifully situated on a fertile and elevated plain, 48 m. w.s.w. of Badajoz, and about 80 m. e. of Lisbon. It was once a place of considerable strength; but its ramparts, and the towers which flanked them, its citadel, its forts, and its watch-towers, are now in a hopelessly ruinous condition. The town itself is not well built, its streets are narrow and winding, and its houses old and badly planned. It has a cathedral, a large Gothic edifice, founded in 1186, the choir of which, rebuilt in 1721, is in the Italian style, and is richly adorned with marbles of various colors. E. has been the see of an archbishop since 1541; has an archiepiscopal library, containing upwards of 50,000 volumes; and several pictures of great merit, attributed to Gran Vasco. It has manufactures of ironware and leather, and a well-attended annual fair. Pop. about 12,000.

E. is a very ancient city. Quintus Sertorius took it in 80 B.C. It was also conquered by the Moors in 712, but recovered from them in 1166. The Roman antiquities of E. are unrivaled in the peninsula. Among these, the temple of Diana, used as a slaughter-house for some time previous to the year 1834, exhibits in its fine Corinthian columns admirable proportion and delicacy of sculpture. There is also an aqueduct, 1200 paces in length, erected by Quintus Sertorius; but the most beautiful Roman relic, and one of the most perfect pieces of ancient architecture in existence, is the tower which rises in the city at the extremity of the aqueduct. It is 12 ft. 6 in. in diameter, and is surrounded by eight columns of the Ionic order. Ionic pilasters decorate the second story, and the top is crowned with a hemispherical dome. It is wholly constructed of brick, and covered with cement of such a durable nature that, although this delicate structure has existed since 70 B.C., few parts of it seem to have been impaired by time.

EVREMOND, CHARLES MARGOTELLE DE ST. DENIS, SEIGNEUR DE ST., an author and wit of the 17th c., was b. at St. Denis-le-Guast, in Normandy, April 1, 1613. He entered the army about the age of 15, became an ensign in less than a year, and in 1637 had the command of a company of foot. About this time, he gained the favor and friendship of Turenne, Grammont, the prince of Condé, and others of high rank, all of whom were delighted with the wit and cheerfulness of his conversation. Having talked himself into the esteem of these men, it was not long, however, until, by the same means, he brought himself under their displeasure. In 1661 his unbridled indulgence in raillery compelled him to take refuge in England. Many attempts were made at the French court to induce Louis XIV. to recall St. E., whose accomplishments, gayety, and wit, rendered him the delight of all who had not smarted from his sarcasm; but Louis remained immovable until 1689, when he granted the exile permission to return. It was now, however, too late. St. E. had by this time surrounded himself with an admiring circle of the wits and beauties of the English court, and resolved to remain where he was. He died in his 91st year, in Sept., 1703.

St. E.'s works, comprising comedies, classical essays, etc., were first correctly published by Des Maizeaux, with a life of the author (Lond. 1705). The works are also translated into English by the same editor.

EVREUX (anciently *Mediolanum*, and more recently *Eburovices*), an episcopal city of France, in the department of Eure, of which it is the capital, is pleasantly situated in

a valley on the Iton, a feeder of the Eure, 60 m. w.n.w. of Paris. It is well built, its streets regular, and the environs prettily laid out in promenades, gardens, and vineyards. The principal building of E. is the cathedral, which dates from the 11th century. The other buildings of note are the abbey church of St. Thaurin, originally built over the tomb of St. Thaurin, the first bishop of E., and having a shrine executed in the 13th c., which once contained his relics; the bishop's palace, built in 1484; and the *Tour de l'Horloge* of the same century. E. has extensive manufactures of bed-ticking, woolen stuffs, cotton-yarn, leather, vinegar, and a trade in its manufactures, and in grain, seeds, timber, and liqueurs. Pop. '76, 11,453.

E. is remarkable for the numerous sieges which it has sustained. It was taken by Clovis from the Romans; was sacked and plundered in 892 by the Northmen, under Rollo; was burned by Henry I. of England in 1119; and in 1194 and 1199 it was twice captured by Philippe Auguste king of France, into whose hands, after a short time, it permanently came. It was frequently taken and recovered in the wars between France and England during the reigns of Henry V. and Henry VI. of the latter country.

VIEIL EVREUX (*Old Evreux*), a village near E., and the supposed site of the ancient Mediolanum, has some ancient remains of a theater, an aqueduct, and fortifications.

EWALD, GEORG HEINRICH AUGUST VON, one of the greatest orientalists of the 19th c., was b. 16th Nov., 1803, at Göttingen, and exhibited a predilection for oriental literature even in his school-days. He studied at the university of his native place, and while still a student, wrote a work on the composition of Genesis (*Die Composition der Genesis*, Braunschw. 1823). In 1823, he became a teacher at the Wolfenbüttel gymnasium; in 1827, extraordinary, and in 1831, ordinary professor of philosophy at Göttingen; and in 1835, was appointed nominal professor of the oriental languages. Travels in search of oriental MSS. led him, in 1826, 1829, and 1836, to Berlin, Paris, and Italy. After the death of Eichhorn, the critical exegesis of the Old Testament was included in his duties as professor of the oriental tongues. The first, and perhaps the most important fruit of his new labors, was his Critical Grammar of the Hebrew Language (*Kritische Grammatik der Hebr. Sprache*, Leip. 1827), an abridgment of which was published at Leipsic in 1835, under the title of Grammar of the Hebrew Language (*Grammatik der Hebr. Sprache;* 5th edit., 1844); and a still simpler epitome in 1842, entitled Hebrew Grammar for Beginners (*Hebr. Sprachlehre für Anfänger*). Before this, however, E. had acquired a high reputation by his work on Canticles (*Hohe Lied Salomo's*, Gött., 1826); his Commentary on the Apocalypse (*Commentarius in Apocalypsin*, Leip. 1828); his Poetical Books of the Old Testament, in 4 vols. (*Die Poetischen Bücher des Alten Bundes*, Gött. 1835–37); and his Prophets of the Old Testament, in 2 vols. (*Die Propheten des Alten Bundes*, 2 Bde., Stutt., 1840). Between the years 1843–50, E. published an important work, in 4 vols., on the History of the People of Israel until the Time of Christ (*Geschichte des Volkes Israel bis auf Christus;* Eng. trans. 1869–74), and a subsidiary volume on the Antiquities of the People of Israel (*Die Alterthümer des Volkes Israel*). The *Geschichte des Volkes Israel*, together with its two continuations, The History of Christ and his Time (*Geschichte Christus und seiner Zeit*, 1857), and the History of the Apostolic Age, etc. (*Geschichte des Apostolischen Zeitalters bis zur Zerstörung Jerusalems*, 1858), is regarded as E.'s greatest work. But Jewish history and literature did not limit the sphere of E.'s wonderful activity. His lectures at Göttingen embraced the literature of the Arabic, Persian, Aramaic, and Sanscrit tongues, and gave birth to such works as that on the Meters of the Arabian Songs (*De Metris Carminum Arabicorum*, Leip. 1825); on Some of the Older Sanscrit Meters (*Ueber einige ältere Sanscrit-Metra*, Gött. 1827), an epitome of the Arabic author Wakidi's work on Mesopotamia (*De Mesopotamiæ expugnatæ Historia*, Gött. 1827), and a Grammar of Arabic, entitled *Grammatica Critica Linguæ Arabicæ cum brevi Metrorum Doctrina*, 2 Bde. (Leip. 1831–33). In 1832, E. published at Göttingen several very important Dissertations on Oriental and Biblical Literature (*Abhandlungen zur orient. und biblischen Literatur*), and planned the well-known periodical, Journal for the Knowledge of the East (*Zeitschrift für die Kunde des Morgenlands*). E., however, was not only a scholar and philologist, but a man of strong political convictions. Having, along with six of his colleagues (the others were the brothers Grimm, Dahlmann, Gervinus, Weber, and Albrecht), protested against the abolition of constitutional law and liberty in Hanover by the new sovereign, Ernest Augustus (previously duke of Cumberland), he was dismissed from his situation, 12th Dec., 1837, and went to England to investigate its public libraries, whence he was called to Tübingen, in 1838, as professor of theology. Here he remained for ten years, during which he was involved in many strifes. In 1841, he was ennobled by the king of Würtemberg. In 1848, E. returned to Göttingen, where he established a Year-book of Biblical Science (*Jahrbuch der biblischen Wissenschaft*), in which, as well as in his work on the Synoptic Gospels (*Die drei ersten Evangelien*, Gött. 1850), and works on the Epistles of Paul (*Die Sendschreiben des Apostels Paulus übersetzt und erklärt*, Gött. 1857), he strove to give a firmer basis to New Testament criticism and exegesis. E. also paid great attention to Ethiopic literature, a result of which is his valuable Dissertation on the Book of Enoch (*Ueber des Æthiopischen Buches Henoch Entstehung*, etc., Gött. 1856). Later works were *Das Sendschreiben an die Hebräer und Jacobos' Rundschreiben* (1871); and *Sieben Sendschreiben des Neuen Bundes* (1871). The distinguishing peculiarity of E., as a

theologian and critic, was his love for the concrete forms in which divine truths are revealed in history, and his dislike of the abstractions into which they are refined away by overspeculative theologians. He regarded it as the especial glory of the Jewish people, that they never lost sight of the concrete—as the Persians and Hindus, for example, did, with whom the realities of religion vanished into the most intangible dreams—but kept it ever before them until, in the fullness of times, there was born in their midst Jesus of Nazareth, the Perfect and Only One, in whom humanity reached its spiritual consummation. E. refused to class himself or to be classed with any theological party in Germany. He was equally opposed to the extreme left represented in Tübingen, and to the extreme right represented in the modern Lutheran movement headed by Hengstenberg. When Hanover was, in 1866, incorporated with Prussia, E. declined to take the new oath of allegiance, and was accordingly required to retire from the functions of the professoriate. He returned to political life; and as the three times elected representative of the town of Hanover in the reichstag, persistently opposed the new political conditions. He died in May, 1875.

EWALD, JOHANNES, one of the best lyric poets of Denmark, was b. at Copenhagen on the 18th Nov., 1743, and d. in the same city in 1781. In his 16th year, when his friends were about to send him to the university of Copenhagen, the restless impatience of restraint which had always characterized him, led him to make his escape to Germany, where he entered as a private soldier in the army of Frederick the great of Prussia, from which he soon deserted to the Austrians. His bravery having attracted the notice of his superiors, he was offered a commission, but this he refused to accept, as it would have obliged him to become a Catholic; and having induced his friends to purchase his discharge, he returned to Copenhagen in 1760, after having taken part in the great campaigns of 1759–60. He now began the study of theology, but a disappointment in love drove him to abandon it, and gave his attention solely to poetry. The first production of E. which attracted general notice was the funeral ode which he wrote on the death of Frederick V. of Denmark in 1767, and which exhibited so much original genius, that it at once raised the young poet to the rank of one of the best writers of his country. This successful attempt was rapidly followed by the appearance of numerous tragedies, operas, and songs, which are remarkable for great lyric beauty. In 1770, appeared the prose tragedy of *Rolf Krage*, which gives evidence of a careful study of Shakespeare and the English dramatists of the Elizabethan age. Although *Balder's Doed* (1773), which breathes the heroic spirit of the ancient bards of the north, and exhibits the specially national tendency of E.'s genius, is regarded by some critics as his *chef d'œuvre*, *Fiskerne*, "The Fisherman" (1780), probably deserves to rank equally high, when considered as a mere lyrical production. His habits of dissipation, and the decided opinions which he expressed in reference to politics, brought him into difficulties of every kind, while his infirmities of temper, and irregularities of conduct, estranged the affection of his nearest relatives, and in the latter years of his unhappy life he was often indebted to the charity of strangers for the means of subsistence. Some of his nautical songs have been raised to the dignity of national odes, and many of his occasional pieces rank among the sweetest poems of his country. He was engaged at the time of his death in compiling an autobiography, and in bringing out the complete edition of his writings, which finally appeared in 1792. His works have also been edited by F. L. Liebenberg (Copen. 1850–55); and a life of E., compiled from hitherto unpublished materials, has recently appeared from the pen of F. C. Olsen, of Copenhagen.

EWBANK, THOMAS, 1792–1870; b. England. He emigrated to New York in his youth, and was appointed commissioner of patents in 1849. He published, besides other works, a *Descriptive and Historical Account of Hydraulic and other Machines, Ancient and Modern;* and *Thoughts on Matter and Force.*

EWELL, RICHARD STODDARD, 1816–72; b. District of Columbia; graduated at West Point, served on the western frontier, on the coast survey, and in the war with Mexico —being engaged at Vera Cruz, Cerro Gordo, Contreras, Churubusco, Molino del Rey, and Chapultepec; was captain of dragoons in 1849, and was engaged on the Gila and Pinal Apache expeditions. He joined the southern forces in the war of the rebellion, serving in the Manassas campaign, at Blackburn's Ford and Bull Run, at White Oak Swamp and Cedar Mountain; was defeated at Kettle Run, was in the second battle of Bull Run, and was wounded in the Maryland campaign; became lieut.gen. in 1863, succeeding Stonewall Jackson. He was taken prisoner April 6, 1865, a few days before the close of the war.

EWING, FINIS, 1773–1841; b. Va.; one of the fathers of the Cumberland Presbyterian church. He was licensed to preach, and in 1803 was ordained by the Cumberland presbytery. His ordination not being recognized by the Kentucky synod, the presbytery being dissolved, and the action of the synod being sustained by the general assembly, he with two others, in 1810, formed the nucleus of the denomination known as the Cumberland Presbyterian church. In 1820, he removed to Missouri, where he died.

EWING, THOMAS, LL.D., 1789–1871; b. Va.; educated by his own exertions, and admitted to the bar in Lancaster, O., in 1816, soon becoming a prominent and successful lawyer in that state. In 1831, he was sent to the U. S. senate, where he soon became

known as opposing the confirmation of Martin Van Buren as minister of England, and president Jackson's measures generally. In 1841, he was appointed by president Harrison secretary of the treasury. Disagreeing with president Tyler (who succeeded Harrison only a month after the latter's inauguration), Ewing, with all the other cabinet officers except Webster, resigned. Under president Taylor he was the first secretary of the new department of the interior, and when Fillmore succeeded Taylor he was appointed senator from Ohio for the unexpired term of Mr. Corwin, then appointed secretary of the treasury. He retired from public life in 1851.

EWING, THOMAS, Jr., b. Ohio, 1829; son of Thomas. He was chief-justice of Kansas, and served in the union army during the war of the rebellion, rising to brevet-maj.-gen. of volunteers. He is a member of congress, where he is a leading democratic advocate of what are known as "greenback views."

EXAMINATION OF A **BANKRUPT.** See BANKRUPTCY.

EXAMINATION OF A **PRISONER,** in Scotland. See DECLARATION.

EXAMINATIONS FOR THE **PUBLIC SERVICE.** Up to the year 1855, all the junior appointments in the several branches of the civil service were made upon a system which was practically one of simple and unchecked nomination. Examinations nominally existed in a few of the departments, but they had degenerated into an unmeaning form. As a result, inefficient or objectionable persons were not unfrequently admitted to the service; and about 1853, much doubt existing as to the efficiency of the public offices, the treasury appointed a commission to report upon the best method of making first appointments to them. The commission advised the adoption for this purpose of competitive examinations, and in 1855 a move was made in the direction pointed out in their report. In May of that year, an order in council appointed civil service commissioners, whose duty it was to be to examine into and certify the qualifications of persons nominated to junior situations in the civil service. Before granting their certificate the commissioners were to ascertain that, in respect of age, health, character, knowledge, and ability, the person proposed to be appointed satisfied the conditions prescribed for the department to which he had been nominated—such conditions being previously fixed for each department, with the assistance of the commissioners, according to the discretion of its chiefs. The power given to the commissioners by the order in council was therefore only that of rejecting persons nominated for appointments when found to be unqualified, according to standards laid down for the commissioners. But a limited system of competition was for some departments at once introduced—several persons being nominated to compete for a vacant place, and the commissioners by examination selecting the best qualified. The rule applicable to junior appointments in the civil service remained as stated above till 1870. Up to that time, by far the greater number of appointments were made after a qualifying or test examination of persons nominated. In the smaller class of cases in which limited competition was admitted, the qualifying or test examination which preceded the competition usually proved fatal to a large proportion of the nominees; and the number of competitors for each place was too small to give the system of competition a real trial. Competition, however, had from 1855 been employed for the selection of members of the civil service of India. It has also been introduced in the case of first appointments to both the Indian and the imperial medical services, to the scientific branches of the army, and to the public works department of India. It was inevitable that it should either be carried further or abandoned altogether, and public opinion was in favor of carrying it further. A committee of the house of commons made a report in favor of competition in 1859; and subsequently a resolution to the same effect was carried in the house of commons. Session after session, the general adoption of competition was urged upon the government by men of influence and position in parliament. Accordingly, in June, 1870, Mr. Lowe being then chancellor of the exchequer, an order in council was issued which made success in an open competition the chief portal to the home civil service.

The new order made certificates of qualification necessary for all such persons as might "be proposed to be appointed, either permanently or temporarily, to any situation or employment in any department of the civil service," excepting only such as might be formally excepted in a manner hereafter described. Rules as to the age, health, character, and knowledge and capacity of persons appointed were still to be settled for each department; but under this order they were to be settled by the civil service commissioners and the chief authorities of each department acting together on equal terms, subject to the approval of the treasury. All appointments to situations included in a schedule appended to the order were to be made by means of competitive examinations, and this schedule embraced nearly all the principal public departments. A second schedule contained a list of appointments to which the order was not to extend; and provision was made for adding situations to, and for withdrawing them from, either of the schedules. It was also provided that examination must be dispensed with where the qualifications requisite for a situation were professional or otherwise peculiar, and not ordinarily to be acquired in the civil service, or where the chief of the department to which it belonged, and the treasury, agreed in thinking it for the public interest that examination should be omitted; the commissioners in such

cases to grant their certificate upon other evidence of fitness, and upon evidence of qualification in respect of age, health, and character. The second schedule excepted from the operation of the order—that is, placed entirely above the control of the commissioners—all situations to which the holder is appointed directly by the crown; all situations included in any order made by the treasury under section 4 of the superannuation act of 1859 (which provides for the superannuation of persons introduced under exceptional circumstances into the civil service); and all situations which are filled in the customary course of promotion by persons previously serving in the same department. Additions have since been made to it of situations to which, on account of the temporary nature of the employment, or of the qualifications required, examination was not deemed to be applicable. Some additions have also been made to the former schedule. Under the teaching of experience, too, many situations of the humbler sort have been withdrawn from it—e.g., those of boatmen and watermen in the customs, of office-keepers, messengers, porters, in all public offices, of warders and matrons in prisons, of excise preventive men in the inland revenue; and for these a test examination only is now employed.

The examinations established by the commissioners, in pursuance of the order in council of 1870, were adapted to the then existing organization of the public offices; and first appointments to clerkships and similar situations in public offices were divided into two classes—the one intended to be filled by persons of high acquirements, who were to perform the more important parts of official duty, the other to be filled by persons of less extended attainments, whose duties were intended to be more or less mechanical. Candidates for the former class of appointments were to be between 18 and 24 years of age, and had to pass a preliminary test examination in handwriting, orthography, arithmetic, and English composition. The subjects of the competitive examinations of this class were English composition, including *précis* writing, English history, English language and literature; language, literature, and history of Greece, Rome, France, Germany, and Italy; natural science, moral science, jurisprudence, and political economy. The competitors might take up all or any of those subjects, but got marks only in subjects of which they showed a competent knowledge; and those who stood highest, up to the number of places to be filled, were the successful candidates. Mathematics and the classics counted heavily in the examination. For the inferior grade of appointments, candidates were to be between 16 and 20 years of age, and had to pass a preliminary examination in handwriting, orthography, and arithmetic. The subjects of the competitive examination were handwriting, orthography, arithmetic, copying manuscript, indexing or docketing, digesting returns into summaries, English composition, geography, English history, and book-keeping. In both classes, the successful candidates were, in order of merit, allowed to choose to which of the situations assigned for competition they should be appointed, provided that they were found qualified under the special regulations applicable to the offices which they respectively selected. For a humbler but very numerous class of appointments in the public service, consisting of second-class (out-door) assistantships of excise and the out-door service of the customs, a third variety of examination was instituted, the subjects being handwriting, spelling, arithmetic and English composition. Candidates in this case were to be between 19 and 22 years of age, and examinations took place simultaneously in all the chief towns in the United Kingdom. The examinations for admission to the two grades of clerkships take place in London, Edinburgh, and Dublin only. Besides the examinations above described, special modes of testing comparative fitness were adopted in the case of a few appointments demanding peculiar, e.g., technical qualifications.

An order in council of 19th Feb., 1876, introduced important changes as regards the lower division of civil service clerks. The subjects of examination for this class remaining what they had been, the minimum age of candidates was raised from 16 to 17 years (provision being made, however, for the appointment—by competition in a more limited number of subjects—of boy-clerks between 15 and 17 years of age). Successful candidates were deprived of the right to choose out of the places vacant the office to which they should be appointed, and were made liable to serve in any office to which, not merely at first, but from time to time, the civil service commissioners should appoint them. Under this order, moreover, the number of persons selected at each examination is to exceed the number of places at the time vacant by 10 per cent. And while appointments are to be given, as a rule, in the order of a list made out according to merit, as shown in the examinations, that order may be departed from, if the needs of particular offices seem so to require; and provision is made, that if a candidate remains unplaced at 25 years of age, his name shall be struck off the list. The order has raised the period of probation after appointment from six months to a year; but the civil service commissioners may give a trial in another office to a candidate rejected after probation. The order further prescribed, having in view that the lower division should be strictly confined to duties more or less mechanical, that the salaries of the clerks should rise from a minimum of £80, by a triennial increment of £15, to a maximum of £200 a year—extra pay, not to exceed £100, being, however, provided for cases of special merit; and that promotion from the lower to the higher division should take place only exceptionally, on the special recommendation of the head of a department, with the assent of the treasury, and on a special certificate granted by the civil service commissioners.

Substantially, this order carried out the recommendations of a treasury commission presided over by Mr. Lyon Playfair. The recommendations of that commission as to the appointments to clerkships of the higher division have not yet (June, 1879) been adopted. These involved even a more considerable departure from the principle of the system introduced in 1870, than has been made in the case of the lower division. The commission advised that there should be a preliminary test-examination open to persons above 17 years of age, and a subsequent examination (also a test rather than a competitive examination) open to persons between 18 and 23 years of age, in a certain number of subjects selected by each candidate from a list of subjects prepared by the civil service commissioners in consultation with the heads of departments. All candidates who showed a certain proficiency in the subjects chosen by them would be put on a list made out in alphabetical order, and be eligible for, though having no right to, appointment to the higher division. Appointments would be made from the list of persons eligible by the heads of departments—the candidates getting the right to refuse places offered to them, without forfeiting their eligibility. This scheme, as the commission allowed, would involve a partial return to patronage. It should be said that it was accompanied by a proposal that every member of the higher division should be allowed to rise (from a minimum of £100) to a maximum of £400 a year, and that extra pay, not to exceed £200 a year, should be awarded in cases of special merit.

The abolition of the system of purchase in the army has been followed by a great extension of the use of competitive examinations. First appointments to the cavalry and infantry are now given on the results of examinations open to all youths between 17 and 20 who can pass a preliminary examination in elementary mathematics, translation from some modern language, writing English from dictation, geometrical drawing, and geography. The subjects of the competitive examination in this case are so arranged as to give great weight to classics and mathematics, while not excluding such branches of knowledge as English history and literature, the French and German languages, and some of the natural sciences, and offering a special premium for proficiency in drawing. The examinations are held three times a year, and are under the direction of the civil service commissioners. Admission to the royal military academy at Woolwich, the portal to commissions in the engineers and artillery, is also obtained by competition in examinations superintended by the commissioners. First appointments to the supply and transport subdepartment of the commissariat and ordnance store department of the army are similarly filled up. The civil service commissioners have also under their charge the examinations for the civil service of India (q.v.); for the selection of persons to be trained for service in the India forest department; and for admission to the Indian civil engineering college, in all of which the system of open competition prevails.

EXAMINATION OF A WITNESS. See EVIDENCE.

EXANTHE'MATA (from a Greek verb, to effloresce, or come out in a rash), a class of febrile diseases (see FEVER) attended by distinctive eruptions on the skin, appearing at a definite period, and running a recognizable course. To this class belong small-pox, chicken-pox, measles, scarlet fever, and, according to some authorities, plague, typhus, erysipelas, etc.

EXARCH was the title first conferred by Justinian on his commander-in-chief and vicegerent in Italy. The conquest of Italy by the Goths in the early part of the 6th c. was a severe blow to the Byzantine pride; and Justinian determined to wipe out the disgrace, and recover the imperial territories. The execution of this project was intrusted at first to Belisarius (q.v.), and afterwards to Narses (q.v.), by whom the reconquest of Italy was effected. The latter was the first who bore the title of E.; and the district over which he ruled was called the *exarchate*. The seat of the exarchs was Ravenna, the different towns and territories belonging to them being governed by subordinate rulers, styled *duces* or dukes. The extent of the exarchate, however, was gradually diminished, until it embraced only the country about Ravenna, the present Romagna, and the coasts of Rimini as far as Ancona. This was brought about partly by the conquests of the Longobards, partly by the dukes of Venice and Naples making themselves independent. In the year 728, even this small portion fell, for a short time, into the hands of the Longobards. In 752, Astulf, or Astolphus, king of the Longobards, put an end to the Byzantine rule at Ravenna; but in 755, he was compelled to resign the exarchate to Pepin the less, king of the Franks, who gave it over to the bishop of Rome, Stephanus II.—In the Christian church, E. was originally a title of the bishops, afterwards of a bishop who presided over several others—a primate. It was borne by the bishops of Alexandria, Antioch, Ephesus, Cæsarea, and Constantinople, till it was finally exchanged for the title of patriarch. A superior over several monasteries was also called in ancient times an exarch. The same title is also borne, in the modern Greek church, by the person who "visits" officially, as a sort of legate of the patriarch, the clergy and churches in a province.

EXCAMBION, in Scotland, is the legal name for an exchange of lands. Heirs possessing under deeds of entail are empowered by the so-called Montgomery act (10 Geo. III. c. 51) to exchange or excamb certain portions of the entailed lands. The portions exchanged must not include the principal mansion-house or offices, or the garden, park,

home-farm, or policy, or more than one fourth in value of the estate. As to the conditions under which, and the proceedings by which, excambions of entailed lands are effected, see Bell's *Law Dictionary*.

EXCELLENCE, or EXCELLENCY, a title now given to ambassadors, as representing not the affairs alone, but the persons of sovereign princes, to whom it was formerly applied. The privilege of being addressed as "your excellence," and of demanding a private interview with the prince to whom he is accredited, are the chief distinctions between the privileges of an ambassador, and an envoy or minister plenipotentiary. See AMBASSADOR, EMBASSY.

EXCHANGE, a term applied to buildings or places of resort for merchants. The name bourse (purse) is applied in France and Belgium to a resort of this kind; and in Berlin, Hamburg, and other German cities, there is the equivalent word börse. Exchanges have usually comprehended an open quadrangle, surrounded by an arcade, free to all persons; but in some cases large reading-rooms now constitute resorts of this kind, and these are open only to a body of subscribers, and visitors whom they introduce. Of this description are the exchanges of Manchester and Glasgow.

Exchanges originated in the commercial cities of Italy, Germany, and the Netherlands, from which last-named country they were copied by England. The merit of introducing them is due to sir Thomas Gresham, who, having resided as British agent at Antwerp in 1550, chose the bourse of that city as a model for the royal E. of London. Their institution in England is therefore coincident with the rise of commercial prosperity at the middle of the 16th century. The first stone of Gresham's burse, for so it was originally called, was laid June 6, 1566, a site being found for it by removing eighty houses in Cornhill, and it was finished in Nov., 1567. It consisted of a quadrangle with an arcade; above was a corridor with stalls, for the sale of wares. This corridor was called the *pawn*—believed to be a corruption of *bahn*—Ger. for path or walk. Outside were shops. On Jan. 23, 1570–71, the burse was ceremoniously opened by queen Elizabeth immediately after dining at the house of sir Thomas Gresham in Bishopsgate street. Having viewed the whole burse, the queen, by herald and trumpet, caused it to be proclaimed "the royal exchange." This first E. of London was almost entirely destroyed by the great fire of 1666. A new E. was forthwith erected on the spot, and opened Sept. 28, 1669. This second royal E. had the same fate; it was destroyed by fire, Jan. 10, 1838. The foundation-stone of the third E. was laid by prince Albert, Jan. 17, 1842. Completed in three years, at a cost of £150,000, from the designs of W. Tite, it was opened Jan. 1, 1845, by her majesty queen Victoria.

The term E. seems to have been naturally adopted from the circumstance that buying and exchanging of merchandise, and also exchanging and paying away of money, formed the chief object of concourse. In the present day, early intelligence in matters affecting commerce and public finance forms a principal attraction of this kind of resort. Although open daily, there are usually certain days and hours of meeting when the throng is considerable. The meeting is familiarly called "Change." The two great days of meeting at the royal E., London, are Tuesdays and Fridays, and the busiest time is from 3 to 4 o'clock. At this time are seen the greatest people on change; some of whom, such as the Rothschilds, occupy a well-known spot.

In London there are several other exchanges, but for special purposes; among these are the corn E. in Mark lane, the coal E. in Lower Thames street, the hop and malt E. in Southwark, the hide and skin E. or market in Bermondsey, and the stock E., near the bank of England. Exeter change, which was a sort of bazaar, with a menagerie of wild beasts, stood in the Strand, upon or near the site of the house of the earl of Exeter; the building, as an interruption to the thoroughfare, was removed in 1829. Numerous additions have recently been made to the list of exchanges in the large towns of England and Scotland; and among smaller towns, the Plait hall at Luton, opened in 1869, may be regarded as an E. for the straw-plait bonnet and hat trade. Corn exchanges are now numerous. In foreign countries, the bourse at Paris, and the merchants' E. at New York, are noteworthy for architectural elegance.

EXCHANGE, in political economy, is sometimes applied to the conversion of the money of one country into its equivalent in the money of another—as by stating the relation which French napoleons and francs bear to British pounds. The technical meaning of the word has now, however, come to be the difference between the actual value of money, taken by the standard of bullion, in any two places with relation to each other. If, in London, it costs more than £100 to pay £100 in St. Petersburg, the rate of exchange is against the former town, and in favor of the latter; an inhabitant of which will be able to pay a debt of £100 in London with less than £100 worth of bullion in St. Petersburg. The process will be best explained by analyzing it through means of simple examples. If Thomson & Co. of London buy £100 worth of wine from De la Rue of Paris, and De la Rue, on the other hand, buy £100 worth of cotton goods from Thomson & Co. of London, the two debts, *were there no others between the merchants of the same towns*, would extinguish each other, and there would be no necessity either for transmitting money or drawing bills of exchange. Suppose, however, that it is not De la Rue, but his neighbor Bonchamp, who has bought the £100 worth of cotton goods from Thomson & Co., then the debts of all will be settled by Bon-

champ paying £100 to De la Rue on Thomson & Co.'s account. Suppose, next, the case of De la Rue being due nothing to Thomson & Co., and Bonchamp being due them only £50, a like sum has to be otherwise found. Van Pradt of Amsterdam is due precisely this sum to Thomson & Co., while either De la Rue or Bonchamp is due the same amount to Van Pradt for a purchase of Gouda cheeses; then it is clear that the several debts can be adjusted among them without the transmission of bullion. It will cost some trouble to adjust the payments, however, and this trouble will have to be paid for. As in paying Thomson & Co. their debt of £100, De la Rue will have to pay for this trouble, the rate of exchange will be against him. If the debt, or any part of it, cannot be met by such an adjustment out of cross debts and credits, it will be necessary for the debtor to send bullion to his creditor; and this being an expensive process, it throws the rate of exchange against the debtor who so pays. For instance, if the sum due by the Frenchmen to Van Pradt was only £25 instead of £50, then De la Rue would have had to be at the expense of sending £25 to London in bullion. No such actual transactions take place in the existing mercantile world, because the accounts in debtor and creditor connected with the three towns above referred to are to be counted in thousands, and ramify into other towns; but the above examples may be held to represent the groups of debtors and creditors, as algebraic signs represent quantities. The individual merchants in one trading town have no idea how the surplus of debit or credit may lie between them, far less can they tell how it may be adjusted by debits and credits in other towns; but through the agency of bankers, bill-discounters, and other persons who deal in money, the relations of all trading-places towards each other are in a constant state of shifting and adjustment; and any one who has to pay a debt in any trading-place can find out how much he has to give to get that debt paid, and can pay it accordingly. When, through the operation of these complicated transactions, you require to give more than £100 in London to get that amount paid in Paris, then the rate of exchange is against London, and is in favor of Paris, where less than £100 in cash will pay a debt of £100 in London. The difference will generally depend on the difficulty of adjusting questions of debt and credit throughout the field of European commerce, in such a manner as to get the debt paid. If it cannot be paid by adjustment, then bullion must be sent; and thus it is generally said that the rate of exchange against any place is limited by the charge of transmitting bullion to it. The rate of exchange is liable to be brought to a level also by commercial exportation and importation, since, whenever it is expensive to get money sent to a country, there is a temptation to send goods to that country, to compensate the debt. In the general circle of transactions of this kind, the state or town which has the largest amount of transactions will have the largest number of debtors and of creditors, and will thus afford the chief facility for each compensating the other. It is thus that London is the center of the money market, where all the debts and credits in the world may be said to meet and extinguish each other. While the old notions about the balance of trade (q.v.) existed, it was supposed that the nation which the exchange was against was going to ruin; while that which it was in favor of was prospering through the other's loss. At present, it is inconvenient and expensive to a country to have the exchange against it. An adverse exchange generally indicates a sort of break in the circle of trade, which it would be advantageous to fill up, and *may* be caused by the commerce of a country decreasing; on the other hand, however, the imports for which a country pays in cash or in expensive bills, may be the same as a highly advantageous traffic. Gold-producing countries find bullion their most advantageous export, and the same is the case with countries into which gold has flowed in excess.

EXCHANGE, DEED OF, in English law, a common law assurance, whereby persons severally seized of lands, mutually grant them in exchange, each his own land for that of the other. In order to a valid exchange, five things are necessary: 1. The two subjects must be of the same nature, as lands for lands, chattels for chattels, but not real for personal estate. 2. The parties must take an equal estate; thus, an estate in fee cannot be exchanged for an estate tail. 3. The word "exchange" must be used. 4. There must be entry, and if either party die before entry, his heir may avoid the exchange. 5. Since the statute of frauds (29 Car. II. c. 3), if the interest be larger than a term for three years, the exchange must be in writing. A mutual warranty and right of entry was formerly implied in an exchange. This effect of the deed has been taken away by 8 and 9 Vict. c. 106, s. 4. By the 8 and 9 Vict. c. 118, s. 92, called the common inclosure act, the commissioners are empowered to make exchanges for the better carrying out of the purposes of the act. A deed of exchange closely resembles in its particulars an excambion (q.v.) in Scotland.

EXCHANGES, MILITARY, are certain arrangements made between officers of the English army. An officer may exchange, or change places, in the guards, or line, with another of equal rank in any regiment of the above corps, by mutual consent, and subject to the approval of the minister of war, and on payment of a sum agreed upon between the officers. On the abolition of the system of purchasing commissions in 1871, the sum paid in effecting an exchange was limited to the actual cost thrown upon the officer exchanging. In view, however, of the general wish of the army, a bill was introduced into parliament in 1874 (but was withdrawn as regards that session), to render

again legal the payment of money as a bonus for exchanges. In the following year (1875) the bill, having been again brought forward, was passed. As each of the exchanging officers enters his new corps at the bottom of his rank, exchange benefits officers who stick to their regiment, by advancing them towards the top of the list, and therefore nearer to promotion. An officer on full-pay may exchange with another on half-pay, provided a younger life be not thereby added to the half-pay list, and subject always to the consent of the secretary for war. Exchanges are ordinarily arranged by the army agents.

EXCHEQUER, CHANCELLOR OF THE. The office of chancellor of the exchequer, in modern times, will be accurately described when we say that he is the first finance minister of the crown. Strictly speaking, he is the under-treasurer, the office of lord high treasurer being now vested in the lords commissioners of the treasury. When the prime minister is a member of the house of commons, he sometimes holds the office of chancellor of the exchequer. The judicial functions of the chancellor of the exchequer may now be considered matter of history. See EXCHEQUER, COURT OF. When the chief baron and the barons are equally divided in opinion, he may be required to rehear the cause with the barons, and to give his opinion. But the last instance in which this was done was in 1735; and though the decision which sir Robert Walpole gave is said to have given great satisfaction, the custom is not likely to be reverted to.

EXCHEQUER, COURT OF, now the exchequer division of the high court of justice in England, is the court wherein all matters relating to the royal revenues are adjudicated upon. It is said (Madox, *Hist. of Ex.*, i. 177) that as early as the reign of William the conqueror a court of exchequer was in existence. This was probably nothing more than a branch of the *Aula Regia*, or great council of the nation; but on the subdivision of that court in the reign of Edward I., the court of exchequer acquired a separate and independent position. The special duty then assigned to the court was to order the revenues of the crown, and to recover the king's debts and duties. The court was then denominated the *scaccarium*, a word derived, it is said, from *scaccus* or *scaccum*, a chessboard; and it was so called because a checkered cloth was anciently wont to be laid upon the table of the court (Madox, *Hist. of Ex.*), a practice which, until the late act, prevailed in the court of exchequer in Scotland. The court formerly consisted of two divisions, an equity, and a common law or plea side. Lord Coke (*Inst.*, iv. 118) appears to doubt whether the equitable jurisdiction of the court can be traced back further than the statute 33 Henry VIII. c. 39. This equitable jurisdiction of the exchequer was abolished by 5 Vict. c. 5, and transferred to the court of chancery. On the first institution of the court, the business was chiefly confined to matters connected with the royal revenue, but a privilege was conceded to all the king's debtors and farmers, and all accountants of the exchequer, to sue and implead all manner of persons. This privilege was exercised by means of a writ of *quo minus* (now abolished by 2 Will. IV. c. 39), wherein it was set forth that the plaintiff being a debtor of the king, was, by reason of the wrong done to him by the defendant, deprived of the means of discharging his debt to the crown (*quo minus sufficiens existit*). The benefit of this writ was by degrees extended to all the lieges, on the fiction that they were crown debtors. By this means the court of exchequer acquired a concurrent jurisdiction with the other courts of common law. The judges of the exchequer consisted originally of the lord treasurer, the chancellor of the exchequer, and three puisné judges; these last were called barons of the exchequer. The title of baron is said by Mr. Selden (*Tit. of Hon.*, 2, 5, 16) to have been given to the judges in the exchequer because they were anciently made of such as were barons of the kingdom. The chancellor of the exchequer sat only on the equity side of the court. The last occasion on which he was called upon to exercise his judicial functions was in the case of Naish *v.* the East India company, when the judges were equally divided in opinion. This case occurred in Michaelmas term, 1735, when sir Robert Walpole was chancellor of the exchequer. The court now consists of six judges —viz., the chief baron, and four barons of exchequer. From this division of the high court, the appeal is to the court of appeal.

The court of *exchequer chamber* was formerly a court of all the judges in England assembled for decision of matters of law (Coke, *Inst.*, iv. 110, 119). Lord Campbell states that the lord chancellor was in the habit of adjourning cases of extraordinary importance into the exchequer, that he might have the opinion of the twelve judges (*Lives of the Chancellors*, i. 10). But the ordinary jurisdiction of the court of exchequer chamber was as a court of error, in which capacity it revised the judgments of the three courts of common law. This court was established by 31 Edw. I. c. 12, for the purpose of reviewing the decisions of the common-law side of the court of exchequer, and was composed of the judges of the other two courts—viz., the queen's bench and the common pleas. By 27 Eliz. c. 8, it was enacted that the judges of the common pleas and exchequer should form a second court of exchequer chamber, for review of certain cases in the queen's bench. But this intermediate court of appeal was abolished by the judicature act of 1873, as inconveniently composed, and somewhat unnecessary. An appeal now lies from each division of the high court of justice in England, direct to the court of appeal, which succeeded to the jurisdiction formerly vested in the house of

lords, as the supreme court of appeal, and consists of the lord chancellor, and the chiefs of the divisions, and the judges of the privy council.

In Scotland before the union, the exchequer was the king's revenue court. It consisted of the treasurer, the treasurer-depute, and as many of the lords of exchequer as the king was pleased to appoint (Ersk. i. 3, 30). The Scottish court of exchequer was continued by the 19th article of the treaty of union, until a new court should be established, which was effected by 6 Anne, c. 26. A privative jurisdiction was conferred on the court as to questions *relating to* revenues and customs of excise; and as to all honors and estates real and personal, and forfeitures and penalties arising to the crown within Scotland. But questions of *title* to lands, honors, etc., were reserved to the court of session. The judges of the court were the high treasurer of Great Britain, the chief baron, and four other barons; and English barristers as well as Scotch advocates were allowed to practice in the court. In cases of difficulty, and where there was a collision of jurisdictions, it was formerly not unusual to hold conferences with the barons; and the form of desiring the conference was to send the lord advocate, and, in his absence, the solicitor-general, to request a meeting, though it has been doubted whether they were bound to carry the message (Shand's *Practice*, 27). By 2 Will. IV. c. 54 it was provided that successors should not be appointed to such of the barons as should retire or die, and that the duties of the court should be discharged by a judge of the court of session. And now, by 19 and 20 Vict. c. 56, the court of exchequer is abolished, and the jurisdiction transferred entirely to the court of session.

The court of *exchequer chamber* in Ireland was established by 40 Geo. III. c. 39, but was abolished as an intermediate court of appeal between the Irish courts and the high court in England.

EXCHEQUER BILLS, bills issued at the exchequer under the authority of acts of parliament, as security for money advanced to the government. They contain an engagement on the part of the government for the payment of the principal sums advanced with interest. These bills form the chief part of the unfunded debt of the country. They were first issued in the reign of William III., in the year 1696, and were drawn for various amounts from £100 to £5. At that time they bore interest at the rate of 3*d.* per day on £100 (Macaulay's *History of England*, iv. 700). The interest was reduced to 2*d.* during the reign of Anne. During the war 1793–1814, the rate of interest was usually 3½*d.* At present, it is generally from 1½*d.* to 2½*d.* per £100 per diem. Holders of these bills are exempt from all risk, except that arising from the amount of premium or discount they may have given for them. The bills pass from hand to hand as money, and are payable at the treasury at par. They may also be paid to government in discharge for taxes. When it is intended to pay off outstanding exchequer bills, public notice is given by advertisement. The advances of money to the government by the bank of England are made on exchequer bills. These bills are a convenient means whereby the government can meet a sudden demand for unusual expenditure. The amount of exchequer bills unprovided for in 1877–78 was £4,593,800. Another portion of the unfunded debt is constituted by exchequer bonds, with fixed rates of interest for definite periods. Between 1877 and 1878 the outstanding exchequer bonds, owing to army expenditure in connection with the eastern question, rose from £7,550,000 to £10,239,200.

EXCHEQUER TALLIES, seasoned wands of ash, hazel, or willow, formerly used for checking accounts in the English exchequer. The sum acknowledged was inscribed on the tally, on the other side of which the same sum was inscribed in Roman characters, together with the payer's name. Notches marked upon the tally indicated by their form the class to which the account belonged. This tally was split, and the payer received one half, which he presented for payment, and which was first matched with the half remaining in the office. It is said that this rude device, which was retained till 1783, was a very perfect protection against fraudulent claims.

EXCIPIENT (Lat. *excipio*, I receive), an inert or slightly active substance, introduced into a medical prescription as a *vehicle*, or medium of administration for the strictly medicinal ingredients. Thus conserve of red roses, or bread-crumb, is used to make up pills; sulphate of potass, or white sugar, in medicinal powders; water, mucilage, white of egg, and many other substances in fluid mixtures.

EXCISE, the name of a tax on commodities, from the Latin *excisus*, cut off, as being a portion of the value of the commodity cut off and set apart for the revenue before the commodity is sold. This is not its actual nature, however, for the manufacturer who looks to a profit on his outlay does not give part of the value to the revenue; he merely counts the tax as part of his expenditure which he intends to get back with a profit, so that it constitutes an addition to the ultimate price which the purchaser or consumer has to pay. A tax on commodities sold and bought is a very obvious one, but it has generally appeared in the simple shape of a toll on goods brought to market; and the complicated arrangements for officially watching the process of a manufacture for the purpose of seeing that none of the dues of the revenue are evaded, is of comparatively modern origin. It was first introduced into England by the long parliament, who established an E. on liquors in 1643. Though always unpopular, the E. in some form or other has ever since continued to be a material element in the taxation and revenue of Britain.

In the earlier part of last century, sir Robert Walpole entertained the notion of enlarging its productiveness while mitigating its proportional pressure, by the bonding system, which suspends the exaction of the duty until the goods are sold, and thus leaves the manufacturer all his capital to be devoted to production. See WAREHOUSING SYSTEM. But the rumor of an enlargement of the unpopular E. duty created a general excitement, and the memorable cry of "Liberty, Property, and no Excise," compelled Walpole to abandon his project.

An E., when compared with other taxes, has its good and its bad features: it is a method of extracting money for national purposes from personal expenditure on luxuries, and is especially serviceable when fed from those luxuries the use of which in excess becomes a vice. On the other hand, it renders necessary a system of inquisitorial inspection, not only very offensive to all free people, but very open to abuse and fraud; while at the same time excessively high duties, and duties on commodities strictly of domestic manufacture, lead to smuggling and all its demoralizing consequences. The evils of an E. were formerly aggravated by the practice of farming the duties—that is, by letting them to the highest bidder, whose interest it became, like any other contractor, to make the greatest possible profit by his speculation, and consequently to exact the duties in the most rigorous manner. In every well-regulated revenue system, it is of course only fair to all parties that the duty as the law lays it on should be fully exacted; but in the age of farming, the arrangements were all slovenly, and there was much latitude of power in the hands of the farmers. The farming system became very oppressive in France, especially in the *gabelle* or excise on that necessary of life, salt. It is a curious fact, however, that when the farming of the E. was abolished in Scotland by the union, the people grumbled, saying they were easier under the farmers, their own neighbors, who acted on the principle of "live and let live," than under the officers sent down from England, who rigidly collected the impost.

An E. works most easily when it is laid on some commodity banished from domestic production, and created by manufacturers on a large scale. In a great distillery, the excise officer is almost a portion of the establishment, who has an eye on every step of the process, with the view of seeing that the commodity does not get into the market without government obtaining its proper share—sometimes far the greater part—of the market price. The social influence of such an arrangement is very different from that of the old candle and salt duties, which made it the function of the exciseman to pounce on a farmer's family melting the surplus tallow of the last killed sheep, or of a fisherman boiling sea-water to procure salt for his potatoes. The manufacturer, however, though he has the benefit of the bonding system, feels the E. regulations to be a perpetual drag and hindrance in his operations, since there are multitudes of minute operations which he cannot perform without sending special notice to the E. department, or having an officer actually present. This renders it necessary, too, that all the steps of the process should not merely be defined as between the manufacturer and the officer, but should be set forth in an act of parliament; and hence deviations for the purpose of economy, or by way of experiment, become difficult, and sometimes impracticable. As difficulties with which the producer has to contend, these things require him to lay on the selling price of the commodity a larger addition, by reason of the E., than the actual amount of the duty.

No method of taxation requires a nicer adjustment to the social condition of a country than an excise. Thus, in England, in the year 1746, a duty of 20*s.* a gallon was laid on spirits, with the view of suppressing the vice of drunkenness, which, on the other hand, it greatly increased, for the law became a dead letter, and the smuggler fully supplied the market, although within the two years in which the law was in force, no fewer than 12,000 persons were, according to Tindal's history, convicted of offenses against the act. In Scotland, the duty, which was 5*s.* 6*d.* a gallon, had to be reduced in 1823 to 2*s.*, on account of the prevalence of smuggling—half the consumption of the country, in fact, paying no duty. The duty has since then been gradually raised, until it now amounts to 10*s.* a gallon, forming a vast source of revenue. The whole E. revenue of the United Kingdom for 1876–77 amounted to £28,408,000, of which more than three fourths were supplied from the consumption of liquor—viz., £15,346,370 from spirits, and £8,274,645 from malt, and there were besides the license-duties for selling liquors. The productiveness of this great source of revenue, and the expense and annoyance connected with the levying of a duty on other miscellaneous commodities, has led to the gradual removal of many E. duties, as, for instance, on salt, candles, leather, glass, soap, and paper. In 1849, the E. department was amalgamated with that of stamps and taxes to form the board of inland revenue; and while many changes have been made on the articles taxable, the board has been making great changes on the organization of the E. system. The only articles on which E. duties are now charged are spirits, malt, sugar, chicory, race-horses, and the passenger receipts of railway companies. But various taxes of the nature of license-duties for following particular pursuits are collected in the E. department; and to these were added, in 1869, a considerable number of items formerly chargeable as assessed taxes. License-duties must be taken out yearly by auctioneers, appraisers, brewers, maltsters, victuallers, sellers of beer, spirits, and wine, sellers of playing-cards if also makers, hawkers, horse-dealers, house-agents, tobacconists, and dealers in patent medicines. Game-licenses, gun-licenses,

and licenses for male-servants, horses, dogs, carriages, and the use of armorial bearings come under the same department. According to the present organization of the E. department, the United Kingdom is divided into collections, each under a collector; the collections are subdivided into districts, each under a supervisor; and these into divisions, each under division-officers and ride-officers. The efficiency with which these officials discharge their duties secures a very complete payment of taxes, and their manner of dealing with the tax-payers leaves a *minimum* of just ground for complaint.

EX'CITANTS, or STIMULANTS, are those pharmaceutical preparations which, acting through the nervous system, tend to increase the action of the heart and other organs. They all possess more or less of a pungent and acrid taste, and give rise to a sensation of warmth when placed on a tender part of the skin. The class is a very numerous one, and the application of excitants or stimulants to the human subject should always be under the supervision of a qualified medical practitioner.

EXCITO-MOTOR ACTION. See NERVOUS SYSTEM.

EXCLUSION BILL, a proposed measure for excluding the duke of York, afterwards James II., from the succession to the throne, on account of his avowed Catholicism. A bill to this effect passed the commons in 1679, but was thrown out by the upper house. As the new parliament summoned in 1681 seemed determined to revert to this measure, it was dissolved, and Charles ruled henceforth without control. See CHARLES II., JAMES II.

EXCOMMUNICA'TION is exclusion from the fellowship of the Christian church. The ancient Romans had something analogous in the exclusion of persons from the temples and from participation of the sacrifices, which persons were also given over with awful ceremonies to the furies. The Mosaic law decreed E. in case of certain offenses; and the intimate connection of things civil and ecclesiastical under the Jewish polity, rendered it terrible even as a temporal punishment. The Jews, in practice, had three degrees of excommunication. The first, *niddui*, was an exclusion from the synagogue for thirty days, that the offender might be ashamed. The second, *cherem*, was also for thirty days, but, besides exclusion from the synagogue, carried with it a prohibition to all other Jews of any intercourse with the individual, and was often proclaimed with sound of trumpet. The third, *shammatha* or *anathema maranatha* (see 1 Cor. xvi. 22), was exclusion from the synagogue and privileges of the Jewish church for life, with loss of civil rights, and was accompanied with terrible curses, in which the offender was given over to the judgment of God. In the Christian church, E. has in all ages been practiced, as indeed every society must necessarily have the power of excluding unworthy members and those who refuse to comply with its rules, and the New Testament plainly recognizes and establishes this right in the church. But two different degrees of E. were soon distinguished—the first or lesser, a mere exclusion from the Lord's table and from other privileges of members of the church; the second or greater, pronounced upon obstinate offenders and persons who departed from orthodox doctrine, more solemn and awful, and not so easily capable of being revoked. Penances and public professions of repentance were required; and in Africa and Spain, the absolution of *lapsed* persons (i.e., those who in time of persecution had yielded to the force of temptation, and fallen away from their Christian profession by the crime of actual sacrifice to idols) was forbidden, except at the hour of death, or in cases where martyrs interceded for them. But for a long time, no civil consequences were connected with excommunication. Afterwards, the greater E. was accompanied with loss of political rights, and exclusion from public offices. The power of E. also, which had been at first in the church as a body, gradually passed into the hands of the bishops, and more especially of the popes, who did not scruple to exercise it against entire communities at once. The *capitularies* of Pepin the less, in the 8th c., ordained that the greater E. should be followed by banishment from the country. The Roman Catholic church pronounces the sentence of E. with many circumstances of terrible solemnity, and it contains a prohibition to all Christian persons of all intercourse with the person excommunicated, and of extending to him even the most ordinary social offices. The latest "examples" made by the pope were Napoleon I. in 1809, and Victor Emmanual, king of Italy, in 1860; neither of whom, however, was excommunicated by name, the pope having confined himself to a solemn and reiterated publication of the penalties decreed by his predecessors against those who unjustly invaded the territories of the holy see, usurped or violated its rights, or violently impeded their free exercise. Pope Innocent III., in the Lateran council (1215), declared that E. put an end to all civil rights and dignities, and to the possession of any property. The E. of a sovereign was regarded as freeing subjects from their allegiance, and in the year 1102, this sentence was pronounced against the emperor Henry IV., an example which subsequent popes likewise ventured to follow. But the fearful weapons with which the popes armed themselves in this power of E., were rendered much less effective through their incautious employment, the evident worldly motives by which it was sometimes governed, and the excommunications which rival popes hurled against each other during the time of the great papal schism. The Greek church also makes use of E., and every year at Constantinople, on a certain Sunday, the greater ban is pronounced against the Roman Catholic church.—The reformers retained only

that power of E. which appeared to them to be inherent in the constitution of the Christian society, and to be sanctioned by the word of God; nor have any civil consequences been generally connected with it in Protestant countries. To connect such consequences with E. in any measure whatever, is certainly inconsistent with the principles of the reformation. Nevertheless, in England, until the 53d of Geo. III. c. 127, and in Ireland, until the 54th, c. 68, persons excommunicated were debarred from bringing or maintaining actions, from serving as jurymen, from appearing as witnesses in any cause, and from practicing as attorneys in any of the courts of the realm. All these disabilities were removed by the statutes above named; and the excommunicated were declared no longer liable to any penalty, except "such imprisonment, not exceeding six months, as the court pronouncing or declaring such person excommunicate shall direct."

In the Roman Catholic church, the power of excommunicating is held to reside, not in the congregation, but in the bishop; and this is believed to be in exact accordance with the remarkable proceeding commemorated in the First Epistle of St. Paul to the Corinthians (1 Cor. v. 3–5), and with all the earliest recorded examples of its exercise. Like all the other powers of the episcopate, it is held to belong, in an especial and eminent degree, to the Roman bishop as primate of the church; but it is by no means believed to belong to him exclusively, nor has such exclusive right ever been claimed by the bishops of Rome. On the contrary, bishops within their sees, archbishops while exercising visatatorial jurisdiction, heads of religious orders within their own communities, all possess the power to issue E., not only by the ancient law of the church, but also by the most modern discipline. As to the prohibition of intercourse with the excommunicated, a wide distinction is made between those who are called "tolerated" and those who are "not tolerated." Only in the case of the latter (a case extremely rare, and confined to heresiarchs, and other signal offenders against the faith or public order of the church) is the ancient and scriptural prohibition of intercourse enforced. With the "tolerated," since the celebrated decree of pope Martin V. in the council of Constance, the faithful are permitted to maintain the ordinary intercourse. It is a mistake, likewise, to ascribe to Catholics the doctrine "that excommunication may be pronounced against the dead." The contrary is expressly laid down by all canonists (Liguori, *Theologia Moralis*, lib. vii. n. 13, 1). In the cases in which this is said to have been done, the supposed "excommunication of the dead" was merely a declaration that the deceased individual had, *while living*, been guilty of some crime to which *excommunication is attached by the church laws*. Catholic writers, moreover, explain that the civil effects of E. in the mediæval period—such as incapacity to exercise political rights, and even forfeiture of the allegiance of subjects—were annexed thereunto by the civil law itself, or at least by a common international understanding in that age. Examples are alleged in the law of Spain, as laid down in the sixth council of Toledo—a mixed civil and ecclesiastical congress—(638); in the law of France, as admitted by Charles le Chauve (859); in the Saxon and in the Swabian codes, and even in the English laws of Edward the confessor; all which, and many similar laws, proceed on the great general principle of these mediæval monarchies, viz., that orthodoxy and communion with the holy see were a necessary condition of the tenure of supreme civil power; just as by the 1 Will. and Mary, s. 2, c. 2, profession of Protestantism is made the condition of succession to the throne of England. Hence, it is argued, the mediæval popes, in excommunicating sovereigns and declaring their subjects released from allegiance, did but declare what was, by the public law of the period, the *civil* effect of the exercise of what in them was a *spiritual* authority.

By the discipline of the Roman Catholic church, kings or queens, and their children, are not included in any general sentence of E., unless they be specially named.

EXCRETION. See SECRETION.

EXCULPA'TION, LETTERS OF, in the law of Scotland, are the warrants granted to the accused party, or panel as he is called, in a criminal prosecution, to enable him to cite and compel the attendance of such witnesses as he may judge necessary for his defense. These letters are issued as a matter of course, on application at the justiciary office, if the prosecution be in the high court, or to the sheriff clerk in cases of sheriff court libels. If there be any special defense, such as *alibi*, a written statement of its nature, along with the articles to be founded on, and a list of the witnesses to be called, must be lodged with the clerk of court the day before the trial.

EXE, a river of the s.w. of England, rises in Exmoor, in the w. of Somersetshire, and flows 19 m. s.e. to the borders of Devonshire, and then 35 m. s. through the e. part of that co. into the English channel at Exmouth. The lower 5 m. form a tideway a mile broad at high water, with wooded and picturesque shores, and navigable for large vessels. The chief tributaries are the Barle, which is 24 m. long, Batham, Loman, Culm, and Creedy. The E. passes Dulverton, Brompton, Exeter, and Topsham. It has a clear and merry current through wooded and romantic vales.

EXECUTION, in the law of Scotland, signifies the attestation by a messenger-at-arms (q.v.), or other officer of the law, that he has given a citation, or carried through a diligence (q.v.), in terms of the warrant of the judge. It corresponds to an affidavit of service of writ or summons in the common law courts, and of a bill or claim in chan-

cery. Executions must be subscribed by the messenger or other executor, and by one or two witnesses; and where the execution consists of more pages than one, each page, or at least each leaf, must be so attested. The witnesses are witnesses to the fact of service, not merely to the subscription of the messenger; and the execution ought strictly to bear that they are witnesses to the premises. Till the passing of recent acts (1 and 2 Vict. c. 114, etc.; see EVIDENCE), two witnesses were necessary to all executions, but one is now sufficient, except in cases of poinding, where two are still required. (Bell's *Law Dictionary*, and authorities cited.)

EXECUTION, CRIMINAL. See CAPITAL PUNISHMENT.

EXECUTION, MILITARY AND NAVAL, usually takes place by hanging or shooting, according to the rank of the offender and the nature of the offense. In some rare instances, blowing from the mouth of a gun has been resorted to. For particulars of the acts for which death is awarded, see PUNISHMENTS, MILITARY AND NAVAL, and MUTINY ACT.

EXECUTION ON CIVIL PROCESS is the method whereby the English high court enforces its judgment on the person or estate of those against whom judgment has been given. The common law of England allows four different writs to issue against refractory debtors—viz., a *fieri facias* (called commonly a *fi. fa.*), a *capias ad satisfaciendum* (*ca. sa.*), *levari facias*, and *elegit*. These writs issue from the court of the division in which the proceedings are grounded, and are addressed to the sheriff of the county. By a *fi. fa.* the goods and chattels of a debtor may be attached. This writ lies against all proprietors, peers, etc. A writ of *ca. sa.* is directed against the person of a debtor. It does not lie against privileged persons. Under this writ, the sheriff may imprison a debtor, and detain him until the debt has been satisfied. A writ so stringent in its effect is regarded by the law as the last remedy; hence, when a *ca. sa.* has been issued, no other writ can proceed against the debtor. But if a *fi. fa.* has been first issued for a part of the debt, a *ca. sa.* will still lie for the remainder. By recent statutes, a *ca. sa.* cannot be issued to imprison for debt unless fraud was involved. A *levari facias* is now seldom used. It is directed against a man's goods and the profits of his lands. The writ of *elegit* is of very ancient date. It is directed against the lands themselves. See ELEGIT. In the chancery division of court, *execution* against the estate is effected by writ of *fieri facias*, or writ of *elegit*. Execution against the person is by writ of attachment. Should this latter writ be returned *non est inventus*, the party prosecuting has it in his option to take out a writ of sequestration of the estate, with issues of course, or to obtain an order for the sergeant-at-arms. An attachment does not lie against a peer or other privileged person, but an order called a sequestration *nisi* is issued. In cases of contempt, the high court in each division has also the power to order personal commitment. In all cases execution may issue immediately, each writ being renewable after a year, within six years; but the court or judge can stay execution to a time fixed —or subject to conditions.

Execution for debt in Scotland, or, as it is technically expressed, diligence in execution, is either real or personal: by the former, the debtor's lands may be attached; by the latter, his person and his movables. In order to entitle a creditor to use diligence against the person or estate of his debtor, the debt on which the diligence proceeds must be duly constituted by a liquid document, or by a decree, or by an action in which decree is sought. In this latter case, the law in peculiar circumstances allows diligence on the dependance, in order that a party may not be deprived of his remedy during the currency of the action, but such diligence depends for its effect upon the judgment in the cause. In the case of bonds and other instruments registered for execution (see REGISTRATION), the law allows summary diligence to proceed; that is to say, execution may proceed without the need of further application to the court. Diligence against heritage includes INHIBITION, ADJUDICATION, RANKING AND SALE, POINDING OF THE GROUND. Personal diligence is by HORNING AND CAPTION, ARRESTMENT, and FORTHCOMING. See these several heads.

EXECUTION ON CIVIL PROCESS (*ante*), the writ which directs and authorizes the officer to carry into effect the final judgment or decree of a court upon the person or estate against whom judgment has been given. It is usually, though not always, a writ for the recovery of money for debt or damages out of the estate of a defendant. Sometimes it is a writ for a defendant upon a judgment in replevin, for a return of goods with damages; and sometimes a writ for the recovery of costs only. An execution on civil process may be taken out as soon as judgment is pronounced, even before it is recorded. The execution, unless otherwise specially provided by statute, or unless a writ of error or some agreement of the parties be interposed, must be taken out within a year and a day from the time the judgment was signed. After that time execution cannot issue unless a *fieri facias*, or *capias ad satisfaciendum*, was previously sued out. The writ is directed to the sheriff, or in case of his disqualification by interest or otherwise, to the coroner, who becomes responsible for its execution, and is liable for damages if he neglect his duty. He is authorized to sell the personal property of the defendant at auction, and apply the proceeds to the satisfaction of the judgment and the costs and charges of the proceedings; and if there be a surplus, it must be paid to the defendant. In general, lands are not subject to execution; but, after a levy has

been made under the *fieri facias*, they must be appraised by the sheriff's jury and delivered to the plaintiff at the valuation until the debt is paid out of the profits. Exemption is made of certain property from execution for debt, as, for instance, household furniture, necessary provisions and fuel for the use of the family, necessary wearing apparel, bedding, tools of trade, books, pictures, etc., and a homestead of a certain value. The laws of the several states in respect to such exemptions are not uniform in all particulars.

EXECUTION OF CRIMINALS. See CAPITAL PUNISHMENT. Executions took place publicly in the United Kingdom till 1860, when it was by an act of parliament made law that all executions should take place within the precincts of a prison, in the sight of certain officials, newspaper reporters, and others invited to be present. The United States, Bavaria, and the colony of Victoria had previously adopted this method. The lack of that terror with which public executions were supposed to strike the multitude is, by this private mode of procedure, held to be more than compensated by the prevention of what was a brutalizing public spectacle. In London, executions took place for the most part at Tyburn until 1783, when a scaffold erected in front of Newgate prison became the common place of execution. "The gallows was built with three cross-beams for as many rows of sufferers; and between Feb. and Dec., 1785, ninety-six persons suffered by the 'new drop,' substituted for the cart. About 1786, here was the last execution, followed by burning the body; when a woman was hung on a low gibbet, and life being extinct, fagots were piled around her and over her head, fire was set to the pile, and the corpse burned to ashes. On one occasion the old mode of execution was renewed: a triangular gallows was set up in the road opposite Green-Arbor court, and the cart was drawn from under the criminal's feet."—Timb's *Curiosities of London*. To render executions more impressive, they were in some cases ordered to take place near the scene of guilt. About forty years ago, two men were hanged at Bishopbriggs, near Glasgow, in sight of the scene of a murder they had committed. The ordinary place of execution in most towns in Great Britain and Ireland is outside the prison. At Edinburgh, executions took place chiefly in the Grassmarket, until 1784, when they were transferred to a platform at the w. end of the Tolbooth, a building removed in 1817. The interval between sentence and execution is about three weeks, the nature of the crime not making any difference in this respect. In all parts of the British empire, the convict under sentence of death is allowed to make choice of the spiritual adviser who shall attend on him; and generally, everything that humanity can suggest is done to assuage the bitterness of his fate. At one time, the bodies of murderers after execution were, in terms of their sentence, delivered to professors of anatomy for dissection; and it would appear that in some instances the mangled corpse was made a kind of public show. Such took place on the execution of earl Ferrers, 1760. The body having been conveyed from Tyburn in his lordship's landau-and-six to Surgeon's hall, was, after being disemboweled and laid open in the neck and breast, exposed to public view in a first-floor room. A print of the time depicts this odious exhibition. The ordering of the bodies to be dissected, having led to great abuse, was abolished in 1832; since this period, the bodies of executed murderers are buried within the precincts of the prison, and the bodies of other malefactors are given to their friends. See ANATOMY (in law). It was also at one time customary to hang the bodies of certain malefactors in chains after execution—as, for example, the bodies of pirates were so hung on the banks of the Thames—but this usage, revolting to public feeling, is likewise abandoned. From the improved state of the criminal law, death-sentences are now of comparatively rare occurrence, and still more rarely are such sentences executed, for, except in cases of deliberate and aggravated murder, the extreme sentence of the law is now usually commuted by the crown into penal servitude for life. The secretary of state for the home department, however, exercises his power in this respect with much care and discretion; and the element of arbitrariness, which might be supposed to spring from differences of temper in different home secretaries, is very seldom obvious.

A great change took place in the public attendance at executions before they were discontinued. Formerly, persons belonging to the higher and middle ranks were habitually present at these dismal exhibitions; many hiring windows at a considerable sum for the occasion. Literature furnishes us with various instances of persons of cultivated mind attending regularly from a morbid love of the spectacle. George Selwyn was fond of seeing executions. His friend Gilly Williams, writing to him of the condemnation of John Wesket (Jan. 9, 1765) for robbing the house of his master, the earl of Harrington, says: "Harrington's porter was condemned yesterday. Cadogan and I have already bespoke places at the Brazier's. I presume we shall have your honor's company, if your stomach is not too squeamish for a single swim."—Selwyn's *Correspondence*, vol. i. p. 323. The earl of Carlisle, writing to Selwyn, speaks of having attended the execution of Hackman, a murderer, April 19, 1779.—*Ibid.*, vol. iv. p. 35. James Boswell, the biographer of Johnson, had a passion for seeing executions, and even for accompanying criminals to the gallows. He was indulged with a seat in the mourning coach to Tyburn, along with the above-named Hackman, the ordinary of Newgate, and sheriff's officer. Visiting Johnson on the 23d of June, 1784, he mentions

that he has just come from the shocking sight of fifteen men hanged at Newgate. Boswell's *Johnson*, vol. viii. p. 331, Croker's edition. At public executions there were to the last considerable crowds, but they consisted chiefly of the lowest of the population. During the excesses of the French revolution, the executions in Paris were enjoyed as a spectacle by crowds of female Jacobins. From the circumstance of these furies employing themselves with knitting needles while attending daily at the scaffold, they became familiarly known as the *tricoteuses* (knitters). Some further information concerning executions will be found in DROWNING, GUILLOTINE, HANGING, MAIDEN, NEWGATE, PARRICIDE, PEINE FORTE ET DURE, PRESSING TO DEATH, TYBURN, AND WHEEL (BREAKING ON THE).

EXECUTION OF DEED, the performance of the ceremonies required by law in order to make a deed binding and effectual. These ceremonies in England consist in signing, sealing, and delivering. According to the ancient common law of England, signature was not necessary to a deed. By 29 Car. II. c. 3 (statute of frauds), signing was required for almost all deeds. But it is still a question which has not been positively decided whether, when a seal is used, it is necessary that the parties should sign. When a party, from any cause, is unable to write, it is usual for him to place his mark in the place of signature. But a mark is unnecessary, and signature by another, at request of the party, is enough. Sealing is the most ancient form of authentication of deeds. In England, deeds are technically known as deeds under seal. A seal is absolutely essential to the validity of an English deed, but any species of seal is sufficient, and in practice a common wafer is usually appended. Delivery is the third requisite to authenticate a deed. Delivery may be made either to the grantee or to another person for him. In the former case, the deed becomes absolute; in the latter, it is called an *escrow*, and does not acquire its full effect till the conditions are fulfilled. Witnesses are not absolutely required to a deed in England, but in practice it is usual that one witness should attest. Before execution, a deed must be read, if required, by a party to it; and if not read, it is void as to the party requesting. Where a person is ordered in chancery to execute a deed or other instrument, and is in prison for failure to comply with the order, the court may make an order that the instrument be executed by the officer of the court; and the execution having been so made, the instrument is equally valid as if signed by the party. The execution of wills in England is regulated by 7 Will. IV. and 1 Vict. c. 26. By this statute it is required that every will shall be signed at the foot or end by the testator in presence of two witnesses. See WILL.

In Scotland, sealing was formerly an essential requisite for execution; but that practice was by 1584 c. 4 dispensed with in regard to registered deeds, and has long fallen into disuse. The solemnities of execution are now regulated by the old acts 1540 c. 117, and 1681 c. 5. By the former of these acts, the signature of the maker of the deed is required, and by the latter, the presence of two witnesses is made essential. In order to a valid execution of a deed or will in Scotland, it is necessary that the maker should sign in the presence of two witnesses, or should in their presence acknowledge his signature, and that the witnesses should then sign their own names, writing after them the word "witness." In case the maker of the deed cannot write, the deed is signed in his presence by two notaries, in presence of four witnesses. But in case of a will, one notary and two witnesses are sufficient. A deed thus witnessed is received as conclusive proof of the facts against the maker. Subscription by initials has been permitted in Scotland. But this mode of execution is irregular, and where it has been adopted, proof has been required that *de facto* the signature was so made. There is one exception to the rule that witnesses must attest the signature—viz., that of a deed or other instrument the whole, or the essential parts of which are holograph, i.e., in the testator's handwriting, being valid without witnesses. Bills and promissory notes, receipts, and mercantile accounts do not require to be holograph or attested.

EXECUTION OF DEED (*ante*). A deed is executed when it is signed, sealed, and delivered; but to make it good against a subsequent purchaser it must be acknowledged before a magistrate and recorded by the officer appointed for that purpose. In some states two witnesses to a deed are required; in others, one witness is sufficient; in others still, the acknowledgment before a magistrate makes any witness unnecessary.

EXECUTIONER, the official who inflicts capital punishment. In England, it is the province of the sheriff to perform this as well as every other ministerial duty enjoined by the criminal courts, but practically he acts by his servants or officers, and he only attends to see the law properly carried out. In royal burghs in Scotland, this duty is imposed on the civic magistracy, one of whom attends for the purpose. In times happily bygone, so numerous were the public executions, that almost every county and town had its E., as an acknowledged officer of justice, with a salary for his subsistence. Yet, we learn that on certain occasions, so odious and so onerous was the duty to be performed, that a special E. was employed. Such was the case at the execution of Charles I.* The task of putting this unfortunate monarch to death is well known to have been performed by two men, who, from a dread probably of the vengence of the royalists, had concealed their faces under visors. In consequence of the mystery thus assumed, public curiosity was much excited, and several persons fell under the suspicion of having been concerned in the bloody deed; rumor even went so far as to

decide who was the wielder of the ax, and who held up the head. It cannot be said, however, that any certainty was ever arrived at on the subject. See *Chambers's Edinburgh Journal*, first series, vol. iv. p. 317.

Like many other offices, that of E. seems to have been at one time hereditary in England. Shakespeare, in *Coriolanus* (act ii. scene 1), makes "Menenius," one of the characters in the play, speak of "hereditary hangmen." In several German states, the office of headsman (q.v.) is said to have been also hereditary; certain families being thus, as it were, condemned to perpetual infamy. The last headsman of the Tower of London died in 1861. The office was latterly a mere sinecure, and has not been filled up. In some parts of England the office was annexed to other posts; for instance, the porter of the city of Canterbury was E. for the co. of Kent, in the time of Henry II. and Henry III., for which he had an allowance of 20*s.* per annum from the sheriff, who was reimbursed by the exchequer. The sum of thirteenpence-halfpenny was long popularly spoken of as "hangman's wages;" such sum, equal to a merk Scots, being the fee at one time paid to the E. when he officiated. In the 17th c., this sum, small as it now appears, was considerably above the wages of a skilled mechanic.

From Gregory Brandon, the London E. in the reign of James I., the name Gregory was employed as a familiar designation for executioners for a considerable period. Brandon had the address to procure a coat-armorial from the college of heralds, and became an esquire by virtue of his office. One of his successors was named Dun, or "Squire Dun," as he was called. Dun is referred to in Butler's *Ghost*, published in 1682:

> For you yourself to act "Squire Dun,"
> Such ignominy ne'er saw the sun.

He was succeeded about the above year by John or Jack Ketch, commemorated by Dryden (*Epilogue to the Duke of Guise*), and his name has since been synonymous with hangman.—Cunningham's *Handbook of London*, article Tyburn.

Executioners have, in some instances, come to trouble. John Price, the London E., was executed 31st May, 1718, for murder. In the account of him, it is stated that one day, on returning from Tyburn, he was arrested for a debt, which he discharged by a small sum in his pocket, along with the proceeds of the clothes of three felons he had just executed.—*Old Bailey Chronicle*, i. p. 147. If this work can be credited, the E. was about the same time arrested while accompanying John Meff, a criminal, to Tyburn. This arrest, which is amusingly depicted in an engraving, stayed the execution of Meff; being conducted back to Newgate, his sentence was commuted to transportation for 7 years, but having returned to England before the period expired, he was taken and executed. On the 24th May, 1736, the E., on returning from Tyburn, after executing five felons, picked the pocket of a woman of 3*s.* 6*d.* (Hone's *Every-Day Book*, ii. p. 695), but what was his punishment is not related. In 1682, Alexander Cockburn, hangman of Edinburgh, was executed for the murder of a bedesman, or privileged mendicant. Early in the 18th c., the E. of Edinburgh was John Dalgliesh, who acted at the execution of Wilson the smuggler in 1736, and is alluded to in the *Heart of Mid-Lothian*. It was he who also officiated at the execution of the celebrated Maggie Dickson, a woman condemned in 1738 for infanticide, but who came to life again after enduring the sentence of the law, and lived unmolested for years afterwards, as a hawker of salt in the streets of Edinburgh. It is said of Dalgliesh, that, in whipping a criminal, he made a point of laying on the lash "according to his conscience," which showed him to have been a most considerate executioner. John High, or Heich, accepted the office of Edinburgh E. in 1784, in order to escape punishment for stealing poultry; he died in 1817. See *Traditions of Edinburgh*, by R. Chambers. The emoluments of the Edinburgh E. at one time comprehended a recompense in kind in the markets of the city—viz., a *lock* or handful, and a *gowpen* or double handful, of meal from each sack; hence he received the designation of *lockman*. These emoluments were latterly commuted into a regular salary of 12*s.* per week, besides a free house, and a special fee of £1 11*s.* 6*d.* at each execution; from the exchequer the E. also received a small annual allowance as deemster (q.v.). The last of the Edinburgh executioners was John Scott, whom it was customary to confine in jail for 8 days previous to an execution, in order to insure his attendance; the expenses incurred by him during one of these periods of seclusion being, as we find, £1 2*s.* 6*d.*, which sum was discharged by the city. Scott was killed by a malicious assault in 1847. Since this period, Edinburgh has had no regular hangman, but, like all other places in Great Britain, depends on the London E., who is hired for the occasion. This personage, until lately, was the well-known William Calcraft. For an execution at Edinburgh in 1854, Calcraft's fee and expenses amounted to £33 14*s.*; his assistant received £5 5*s.*; and for taking charge of both, the city criminal officers were paid £1 1*s.*: total expenses for the execution, £40, independently of the cost of erecting the scaffold. In 1815, the magistrates of Glasgow entered into an arrangement by stamped indenture with Thomas Young, who engaged to act as E. at a recompense of £1 per week, a free house, with coal and candles, a pair of shoes and stockings once a year, and a fee of a guinea at each execution. At Young's death in 1837, his successor, John Murdoch, was recompensed differently He was paid £1 per month, by way of retainer, and the sum of £10 for an execution. After his death, Calcraft officiated, he in turn having been succeeded by Marwood. Besides the usual fees, execu-

tioners have from early times claimed the clothes of those who suffer, as a perquisite of office. See PERQUISITE.

The most noted E. of Paris was the late M. Sanson, who officiated at the mournful death-scene of Louis XVI., and is said to have possessed acquirements and feelings not to be expected from one of his degrading profession. He was latterly assisted by his son, M. Henri Sanson. See *Memoirs of the Sansons* (1875). The Parisian E. is familiarly styled "Monsieur de Paris."

No professional E. is employed at capital punishments in the United States. There the sentence is executed by the sheriff, with the assistance of an under-jailer; this last official performing the fatal toilet of the criminal, while the sheriff, by a movement affecting the drop, puts him to death in virtue of the sentence and the law of the state. This seems an advance on the practice in England, where, however, it could not be introduced, for the simple reason that no one fit for the rank of sheriff or magistrate would accept of office with an obligation to perform the duty of E. in prison. The military E. attached to an army is styled provost-marshal (q.v.).

EXECUTIVE. See GOVERNMENT.

EXECUTIVE DEPARTMENT, the branch of the government to which is confided the duty of executing the laws; in distinction from the legislative department which enacts, and the judicial department which expounds them. In the U. S. government, the chief executive officer is the president; in the several states, the governors thereof. The secretaries of state, treasury, interior, war, and the navy, with the postmaster-general, and the attorney-general, are officers of the executive department under direction of the president. The law does not oblige him to consult them, but the custom has made them his counselors and advisers. In the different departments are numerous subordinate executive officers, known as assistant-secretaries, clerks, examiners, solicitors, auditors, controllers, commissioners, deputy-commissioners, directors, chiefs, superintendents, etc. There are also collectors of internal revenue (in districts), and collectors and surveyors of customs (in districts).

EXECUTOR, IN ENGLAND, the person to whom the execution of a last will and testament of personal estate is by testamentary appointment confided (Williams on *Executors*, 197). The appointing by will of an E., without giving any legacy or appointing anything to be done by him, is sufficient to make a will. The appointment of an E. can only be by a will, the person who takes charge of the estate of an intestate being called an administrator (q.v.). The appointment may be either express or constructive, i.e., gathered from the general terms of the will. An early duty of an E. is to take probate (q.v.) of the will. He derives his title solely from the will; the estate vests in him from the death of the testator, at which time his responsibility begins, and from which time he may enter upon all the duties of managing the estate. But his position will not be recognized as suitor in any court until he has taken probate. The whole personal estate vests in the E., and if the testator has made no disposition of the residue, it devolves, by common law and equity, upon the executor. The court, in some cases only, will endeavor so far to carry out the intentions of the testator as not to give the beneficial interest to the E., where there appears from the will a necessary implication that he should not receive it. By 21 Henry VIII. c. 5, an E. is bound to prepare an inventory of the personal estate. This, if required, must be produced. An E. may raise actions in respect to the estate in his charge; and generally it may be said that his powers, duties, and liabilities are commensurate with those of the deceased. He may enter the house of the deceased to remove the personal property. The first claims to be discharged are those of the funeral and the expenses of probate. He must then pay the debts; and he is responsible for paying them in due order, so that those having a legal preference shall first be discharged. An E. is not bound to accept the office; but if he administer, he cannot then renounce the executorship without cause. On the death of an E. the office does not pass to his executor.

An E. to a will in Scotland is called a testamentary E., to distinguish him from the next of kin, who are styled executors. The term E. is given to all who manage the estate of a deceased, whether appointed by will or by authority of the court. The former are called executors nominate; the latter, executors dative. All executors must, before entering upon their duties, obtain *confirmation* (q.v.) from the commissary court. This is equivalent to probate in England. But in Scotland, no right vests in the E. until after confirmation, except a title to sue, being exactly the reverse of the English rule. An E. acting without confirmation is called a *vitious intromitter* (q.v.). Executors must, on entering upon their office, exhibit a full inventory of the whole movable estate of the deceased. An E. is only liable to the extent of the inventory. He is not bound to pay interest on the funds in his hands unless they bore interest before confirmation, or unless he is guilty of undue delay in administering the estate. He is not bound to pay the debts for six months after the death of the deceased. But, as in England, the expenses of the funeral and confirmation are entitled to immediate payment. Servants' wages and a year's house-rent have also a preferable claim. An E. is entitled to claim one third of the *dead's part* (q.v.), after deducting debts. But should he receive a legacy, he is bound to impute that towards payment of his claim.

EXECUTOR (*ante*), a person to whom another man has committed the execution of his last will and testament. He may decline to act if he choose, in which case the court will appoint an administrator. But if he accept and enter upon the trust he cannot resign it without reason. In general, any person capable of making a contract may be an executor. His duties are to bury the deceased in a manner suitable to the estate left behind, to prove the will, take possession of the property of the testator, make an inventory of the same, collect the assets, and pay the debts and legacies. For this the law gives him all the powers of the testator. Generally an executor is required to give bonds for the faithful discharge of his duties.

EXECUTORS, in Scotland, the heirs *in mobilibus* of a person deceased. They are the whole next of kin in the nearest degree in blood; but where the heir to the heritage is one of the nearest of kin (e.g., the oldest son), he is not entitled to share in the movables without collation (q.v.). The order of succession among executors is first descendants, then collaterals, or brothers and sisters, and their children; and, lastly, ascendants, i.e., the father and those claiming through him. But the mother and her family, till recently, were not allowed to succeed to her own child *ab intestato*. This harsh rule was so strictly carried out, that where there were no relations by the father, the crown succeeded as *ultimus hæres*, to the exclusion of the mother.

By 18 Vict. c. 23, the law of succession to movables has been in some degree altered. On the death of an intestate leaving no issue, his father, if he survive, is entitled to take one-half of the movable estate, in preference to brothers and sisters. If the father be dead, the mother takes a third. No further provision, however, is made for the mother in case she is the only surviving relative. The result is, therefore, that the other two-thirds would still go to the crown. See SUCCESSION, MOVABLES.

EXECUTORY DEVISE, in English law, is such a limitation of a future estate or interest in lands or chattels (though in the case of chattels it is more properly a bequest) as the law admits in the case of a will, though contrary to the rules of limitation in conveyances at common law (Blackstone, *Comm.* ii. 334). By common law, a freehold cannot be limited on a freehold, as an estate to A and his heirs; but if he die before he attain the age of 21, then to B and his heirs. Nor can an estate be given to commence at a time uncertain, as to A when he returns from Rome. But though these limitations would be void in a deed, common law will sustain them as executory devises. This form of limitation is restrained by the law against perpetuities (q.v.), which requires that the estate must take effect within a life or lives in being and 21 years after. The law will not interpret a limitation as an E. D., if it can be otherwise sustained. Whenever, therefore, a future interest in land is so devised as to fall within the rules laid down for the limitation of contingent remainders, such devise will be construed as a contingent remainder, and not as an executory devise (Cruise, *Digest*, vi. 369). An E. D., unlike a remainder, cannot be defeated by any act of the first taker or devisee; when, therefore, an absolute power of disposition is in the first taker, the limitation over is not an executory devise. Within the period allowed for these estates, an E. D. constitutes a species of estate tail; and for this purpose, it is frequently used in America.

EXEGE'SIS (from Gr. *ek*, out of, and *ēgeomai*, I lead) properly signifies the exposition or interpretation of any writings, but is almost exclusively employed in connection with the interpretation of sacred Scripture, to which, therefore, the subjoined remarks specially apply. The expositor or interpreter is called an *exegete*. To interpret a writing, means to ascertain thoroughly and fundamentally what are the conceptions and thoughts which the author designs to express by the words he has used. For this purpose, it is necessary, in regard to books written in a foreign language, that the exegete should know well, first, the precise signification of the words and idioms employed by the writer. This is termed *grammatico-philological* exegesis. In the next place, he must be acquainted with the things denoted by these words, and also with the history, antiquities, and modes of thought of the nation. This is termed *historico-antiquarian* exegesis. Both together constitute *grammatico-historical* exegesis. When only an exposition of the system of thought contained in a writing is sought after, this is termed *doctrinal* or *dogmatic* E.; while the investigation of a secret sense, other than that literally conveyed by the words of a writing, is termed *allegorical* exegesis. But if a writing is regarded from a practical point of view, and in reference to its bearing upon life and manners, the exposition is termed *moral* exegesis. The complete and coherent E. of a writing forms what is called a *commentary*, but, if restricted to certain difficult words or knotty points, the elucidations are termed *scholia*. The scientific exhibition of the rules and means of E. is called *hermeneutics* (q.v.). In the earliest ages of the Christian church, the allegorical method of E. prevailed. By the Alexandrian school in particular, it was greatly abused. Origen, however, the greatest of this school, deserves high credit for endeavoring to secure a basis for grammatical E., by a sharp separation of the literal, the moral, and the mystical sense of Scripture. Besides the Alexandrian school, the Syrian historico-exegetic school had many adherents in the east. Among these may be mentioned Cyril of Jerusalem, Ephraem Syrus, John Chrysostom, and Theodorus of Mopsuestia. First, towards the end of the 4th, and during the 5th centuries, a narrowing of the principle of the free interpretation of Scripture begins to be

observable, through the rapid development of monkery and the hierarchical system; in consequence of which, the importance of the classic writers was undervalued, and the study of them ultimately abandoned in the western church, while a feeling of superstitious reverence, wholly unintelligent and unscriptural, grew up for the letter of the "Word," and E., if employed at all, was employed simply to bolster up preconceived views. By and by, independent E. was supplanted by the well-known *Catenæ*, consisting of expositions of books of Scripture strung together from the writings of the older church fathers. In the east, the first of these was got up by Procopius, 520 A.D.; in the west, by Primasius, 550 A.D. Although much was done for the E. of the Old Testament by eminent Jewish scholars, such as Solomon. Jarchi, Aben-Esra, and David Kimchi, Christian theologians for the most part, knowing only the text of the Vulgate, stuck, during the dark ages, to the interpretations of the fathers. First in the 12th, 13th, and 14th centuries, efforts were made by individual scholastics, especially by Abelard, St. Bernard of Clairvaux, Thomas Aquinas, and Nicholas of Lyra, to reintroduce something like a grammatico-historical E. of Scripture. But it was mainly to the great revival of letters in the 15th c., and the humanistic scholars whom it produced, such as Laurentius Valla, Erasmus, etc., that an advance in E. was owing. The Complutensian polyglott also exercised a great and beneficial influence. Shortly after, the reformation gave an impulse to E., so powerful, that it is felt at the present day; and, indeed, its effect is far more visible in the recent biblical criticism of Germany than it was in the days of Luther himself. The desire for the unfettered E. of Scripture strongly animated the reformers, but, in fact, the long black night of ignorance—known as the dark and middle ages—has influenced them too, and disqualified them for framing at once a comprehensive exegetical science. It required a couple of centuries to recover from the effects of mediæval ignorance. The more important Lutheran exegetes are Luther, Melanchthon, Brenz, Joach. Camerarius, Strigel, Chemnitz, etc.; of the reformed or Calvinistic school may be mentioned Calvin, Zwingli, Œcolampadius, Bucer, Beza, Bullinger, Grotius, Clericus, etc.; and of the Roman Catholics, especially Paul Sarpi. During the 17th c., the E. of Scripture was for the most part at a stand still, but about the middle of the 18th c. it suddenly revived. This revival was due principally to Joh. Aug. Ernesti (q.v.), and J. Sal. Semler (q.v.), who established new principles of criticism and hermeneutics, through which grammatico-historical E. once more began to make its appearance. The labors of Wetstein and Kennicott in regard to biblical MSS. were of immense service. Since their day, on to the present, criticism has been constantly at work on the writings of the Old and New Testament. Cognate languages have been more and more profoundly studied; the antiquities of the east, of Egypt, Assyria, Arabia, and other countries, have been investigated, and brought to bear on the subject; the manners and customs which prevail in these lands, and which, in some of them, have prevailed from time immemorial; the laws that determine the growth of civilization in nations, and enable us to enter into and comprehend the condition of mind peculiar to races in a primitive stage of development, and to appreciate their modes of thought, and to weigh the value of their literary and religious records—all these have received, and are still receiving careful attention at the hands of numerous scholars, so that it is not too much to say that we are at the present day better fitted—so far as outward helps go—to understand the real meaning of Scripture, than those who have lived at any other period subsequent to its composition. Among the eminent names in the recent development of biblical E. are F. A. Wolf, J. Dav. Michaelis, Eichhorn, Gesenius, Wahl, Bretschneider, Winer, Rosenmüller, Hitzig, Hirzel, Ewald, Umbreit, De Wette, Knobel, Lücke, Paulus, Meyer, Olshausen, Hengstenberg, etc. The influence of the *grammatico-critical*, and *critico-historical* E. of modern Germany, is only beginning to make itself felt in this country. The most important contributions to the science recently made by British scholars, are those by Conybeare and Howson, Alford, Stanley, Jowett, Ellicott, etc.

EXELMANS, Remy Joseph Isidore, Comte, a distinguished French gen., was b. at Bar-le-duc, 13th Nov., 1775. He entered the army in 1791, was promoted to the rank of capt. in 1799, served with distinction in the campaign of Naples under Macdonald and Championnet, and in 1801 was attached as aide-de-camp to the staff of Murat. In 1808, while with Murat in Spain, he was arrested, and sent to England, where he remained a prisoner for three years. He was with Napoleon in the Russian campaign in 1812, for his brilliant conduct in which the emperor created him gen. of division, Sept. 8th of the same year. E. seems to have been equally esteemed under every successive government. On the fall of Napoleon, he was for some time banished from France, but was permitted to return in 1819. In 1831, Louis Philippe restored his titles and rank. Louis Napoleon named him grand chancellor of the legion of honor, and on Mar. 11, 1851, raised him to the dignity of *maréchal de France*. On the 21st July, 1852, E. had a bad fall from his horse, from the effects of which he expired on the following night.

EXERCISE, a very important element of medical regimen, both in the preservation of health and in the cure of disease. To preserve all the functions of the body in healthy action, it is necessary to secure their due and regular action or E.; to allow of complete inaction of any part or function, is to initiate disease, and probably even

structural change, or atrophy. Hence the development of the muscular system, of the secretions, and even of the mind and its organ, the brain, require the more or less regular use of E., either in the form of productive and useful work, or by means of artificially devised methods calculated to serve a like purpose in regard to the economy. Thus, scholastic education is exercise for the mind; gymnastics (q.v.), for the body. Both these means enter largely into enlightened medical practice, though they are often too much neglected. E., to be beneficial, must be attended with rest, to allow the tissues which are worn away during vital action to be restored; but rest of one part or organ is often best secured by bringing others into activity; so that, except during sleep, there is rarely a necessity for a complete and simultaneous disuse of all the faculties, or even of those most immediately under our control. The best regulated life is that which secures due and proportionate E. at intervals for all the functions, mental as well as bodily.

EX'ETER (the *Cær-Isc* of the Britons, the *Isca Damnoniorum* of the Romans, *Exancester* of the Saxons), a city, episcopal see, separate county, parliamentary and municipal borough, and river-port, in the s.e. of Devonshire, and the capital of that county. It lies on an aclivity on the left bank of the Exe, 10 m. n.w. of its mouth, 170 m. w.s.w. of London, and 73 m. s.w. of Bristol. It is on the whole well built and clean, and has two main lines of street meeting near the center. There are some fine squares and terraces. The guildhall has a singular portico, added in 1593, and projecting into the street. It was restored, with considerable regard to artistic effect, in 1864. In 1865, an elegant new post-office was erected, as was also a lunatic asylum, just outside the city. A quadrangle of almshouses, 45 in number, was completed in 1866, along with a church attached to them; and the Albert memorial museum was opened in 1868. The number of British and foreign vessels (sailing and steam) which entered the port in 1872 was 524, tonnage 61,000; which cleared it, 222, of 17,620 tons. The pop. of the parliamentary borough in 1871 was 44,226. E. cathedral, a cruciform structure, magnificent in its ornamentation, was erected 1112–1478. In one of its towers is the great Tom of E. or Peter's bell, 12,500 lbs. weight, and a large curious antique clock. E. has a large floating ship-basin, 917 ft. long, 90 to 110 ft. broad, and 18 ft. deep; and a ship-canal, 15 ft. deep and 30 ft. broad. This canal extends 5 m., and terminates at Turf, about 2 m. from the head of the estuary of the Exe. E. has magnificent nurseries, and exports dairy, farm, and orchard produce from a neighborhood rich in such products. The town sends two members to parliament. E. was anciently the chief residence of the West Saxon kings. E. bishopric, fixed here in 1050 by Edward the confessor, includes Devon and Cornwall, 23 deaneries and 588 benefices. The city was formerly surrounded with walls and strongly fortified. On a height to the n. of E. are the ruins of Rougemont castle, built by William I., on the site of one said to be as old as Cæsar's time. Many Roman and Greek coins have been found in E., besides tesselated pavements, fragments of columns, and small bronze statues.

EXETER, a village and one of the co. seats of Rockingham co., N. H., on Exeter river, and the Boston and Maine railroad, 51 m. n. of Boston; pop. of township '70, 3,437. The village is built around the falls, and the chief business is manufacturing, especially of cotton. Here is the richly endowed Phillips academy, which for generations has had a national repute, founded in 1781 by John Phillips; also the Robinson female seminary, with large endowment, and about 240 pupils. There is a good library belonging to the town. The place was settled in 1638 by the Rev. John Wheelwright, an exile from Massachusetts. It suffered greatly in the various Indian wars of the century, and 38 of its citizens died in the continental army. It is an attractive village, with cultivated society.

EXETER COLLEGE, Oxford. This college was founded in 1314 by Walter de Stapledon, bishop of Exeter, who removed from Hart Hall to the present site of E. C., a rector, and twelve fellows. In 1404, Edmund Stafford, bishop of Salisbury, added two fellowships, and gave the college its present name. Sir William Petre, in 1565, founded eight more; and in 1636, Charles I. annexed one more for the islands of Jersey and Guernsey. In 1770, Mrs. Sheers left certain rents for the establishment of two fellowships. All these fellowships were originally appropriated to various archdeaconries or counties, especially in the w. of England. A peculiarity in this college was, that the above foundations, though generally called fellowships, were, strictly speaking, only scholarships. Important changes were introduced by the rector and fellows, under the authority of 17 and 18 Vict. c. 81, and approved of by the commissioners appointed to carry out that act. The number of fellowships was reduced to 15—all open without any restriction as to place of birth. The revenues of two fellowships were divided among the rectorship and the 15 fellowships. The remaining 8 fellowships were devoted to the foundation of 22 scholarships; ten open without restriction; ten limited to persons born, or for three years educated in the diocese of Exeter; and two limited to persons born in any of the Channel islands. Several exhibitions also are attached to the college; and there are about 16 benefices in the gift of the society. The number of names on the books is about 750.

EXETER, or **EXON DOMESDAY**. See DOMESDAY BOOK.

EXETER HALL, a large proprietory building, on the n. side of the Strand, London, is 131 ft. long, 76 ft. wide, and 45 ft. high. It was completed in 1831, and can contain upwards of 3,000 persons. It is let chiefly for religious assemblies, and is in great request during the "May Meetings" of the several religious societies. It is also let as a concert-room and has been the scene of many great musical fêtes.

EXHAUSTIONS, METHOD OF, is a mode of proving mathematical propositions regarding quantities by continually taking away parts of them. The method was frequently employed by the ancient geometers; its fundamental maxim, as stated by Euclid, being that those quantities are equal whose difference is less than any assignable quantity. Euclid employs the method in Book x. Prop. 1; and it was used by Archimedes to prove that the area of a circle is equal to that of a right-angled triangle whose one leg adjoining the right angle is the radius, and the other the circumference. In this ancient method we may see the rudimentary form of the modern transcendental analysis.

EXHIBITION, ART. See ART EXHIBITIONS.

EXHIBITION, INDUSTRIAL (Fr. *Exposition de l'Industrie*). Exhibitions of this kind originated in France, where the first took place in 1798, at the suggestion of the marquis d'Avèze. It was held in the Maison d'Orsay and its grounds; but it appears to have been rather a collection of such objects of French art-manufacture as could be borrowed from their owners, than an assembling together of competing artists and manufacturers, with their respective works. It is, nevertheless, interesting as a historical fact, having been the first of these displays of which we have any clear and authentic record; and its more important effect was to familiarize the French mind with national exhibitions.

In the same year, another exhibition was held in Paris, on a grander scale, and with considerable success. It embraced all kinds of manufactures; whereas that at the Maison d'Orsay was chiefly devoted to those of artistic merit; hence the credit has been claimed for the latter one of being the commencement of industrial exhibitions, certainly, however, without justice or truth.

In consequence of the obvious utility of the exhibitions of 1798, another was held in 1802, under the consulate of Napoleon, with equal success, and thus led to the establishment of triennial exhibitions, which were, with occasional interruptions from political causes, held until the novel idea was originated in this country, in 1850, by his royal highness the prince consort, of holding a universal exhibition open to all comers.

That was not, however, the first industrial exhibition held in the United Kingdom. The Royal Dublin society, possibly from the French sympathies of Ireland during the revolution, as early as 1829 adopted the plan of triennial exhibitions, which was several years before any other part of the United Kingdom; they took place in the society's rooms in Dublin. Like the French, however, they at first comprised only specimens of native industry.

In England, the first well-organized exhibitions were those of the Cornish polytechnic society, in which were illustrated the mineral wealth of the co., and its mechanical appliances for mining purposes, etc. These were continued annually without intermission until 1850. Manchester, Birmingham, and Liverpool also held local exhibitions; that of the second town was by far the most important, and is fairly entitled to be considered the prototype of the 1851 exhibition; indeed, it is by no means certain that both did not arise from the same cause—the agitation in favor of a great national exhibition, commenced by his royal highness the prince consort and the society of arts as early as 1848. The Birmingham exhibition was held in 1849.

The Manchester exhibitions were the earliest held in the great English industrial towns, but they, like those which were held in the mechanics' institutes of Liverpool and Leeds, and subsequently in the collegiate institution of Liverpool, had a mixed character, the illustrations of art and manufactures being pretty well mingled with objects of natural history and various other curiosities, for the amusement of the visitors. That of Birmingham, however, was much more completely devoted to the true objects of industrial exhibitions; it was held in the spacious apartments of Bingley hall, and was a great success, especially when it is borne in mind that it was carried out solely by private enterprise. The multitudinous manufactures of that wonderful place were amply illustrated, and a most careful attention was paid to the exhibition of those objects of art which were best calculated to foster the taste of designers, and others, whose duty it was to give refinement to the masses, by gradually improving those objects of necessity and ornament in every-day use. The success of the Bingley hall exhibition no doubt acted most beneficially upon that of 1851 which was approaching, for it gave an unmistakable impetus to the industrial pursuits of the people of Birmingham, and through them acted widely upon others.

The first metropolitan movement in favor of holding a national exhibition in this country was immediately after the French exposition of 1844, the results of which were so beneficial, that several applications were made to the government requesting that the matter should be officially taken up. The government, however, as usual, proved itself to be simply executive, and did nothing.

In the meantime, the society of arts tried the experiment of holding exhibitions annually in their own building in the Adelphi; but these, though eminently successful, were not sufficient to satisfy those with whom a national exhibition had become a fixed

idea. In 1849, his royal highness devoted himself thoroughly to this object, and made the happy suggestion of throwing open the exhibition to all nations. The plans, too, were suggested for raising the necessary funds and other essential points, and the scheme soon took a tangible form; and it was finally determined by the government to issue a royal commission, which was gazetted Jan. 3, 1850. From this moment the great exhibition was fairly launched. In order to enable the commissioners to enter into contracts, and otherwise incur obligations, it was necessary to procure subscriptions to a guarantee fund. The subscription-list was opened by the queen with £1000. The exhibition took place in a vast structure of iron and glass, called the crystal palace, in Hyde park, London. The edifice, planned by sir Joseph Paxton (q.v.), was opened by her majesty, May 1, 1851. It was 1851 ft. long by 456 ft. broad, and 66 ft. high; the entire area covered being 13 acres. On the ground-floor and galleries there were 8 m. of tables. The glass employed in the structure weighed upwards of 400 tons. The number of exhibitors exceeded 17,000. The exhibition was open 144 days, being closed Oct. 11. The entire number of visitors was 6,170,000, averaging 43,536 per day. The largest number at one time in the building was 109,760, on Oct. 8. The entire money drawn for tickets of admission amounted to £505,107; and after all expenses were defrayed, a balance of £150,000 was left over; so that there was no call on those who subscribed the guarantee fund. Popularly, this great exhibition was properly enough called the world's fair, for it attracted visitors from all parts of the world. When the exhibition was over, the building was cleared away.

The importance of this celebrated exhibition was so obvious, that other countries became anxious to have something of the same kind. An exhibition was held in Cork in 1852; although not of international character, it was the first for which any special structure was erected in Ireland, and deservedly gave great satisfaction. The home manufactures of Ireland were admirably displayed in conjunction with those of other parts of the kingdom. Dublin got up an international exhibition in 1853, and by the princely munificence or Mr. Dargan, was enabled to make an admirable display, in a building of great beauty. The Dublin society added a new feature—high art was associated with industrial art, and a gallery of pictures, the finest ever brought together in this kingdom before, was there exhibited with great success. In the same year, a similar exhibition took place in a crystal palace in New York. France, in 1855, repeated the same experiment with immense success; both the industrial and the art collections were such as the world had never seen before. Though wanting the imposing magnitude of the Hyde park building, the contents of the palais de l'industrie, with its detached picture-gallery and its annèxe, were of the choicest description, and reflected the highest credit on French taste and skill. Several other continental nations followed with various success. In Europe, it has now taken root, and every country looks upon an exhibition of its industrial resources and productions, from time to time, as a grand necessity which must be met. In 1861, there was an exhibition at Haarlem, in which a vast assemblage of admirably arranged specimens illustrated every industry followed by the most industrious and methodical people of Europe. In Belgium, also, a small industrial exhibition was held in 1861 at Brussels, consisting chiefly, however, of articles of use, in which useful design was the chief consideration.

Such is a brief outline of the early history of these exhibitions, which now form a prominent feature in this era of the history of civilization. The fullness of their effects is still to be seen, but, judging of the beneficial effects they have already produced, it is not too much to say, that they appear destined to help most largely in diffusing a love of industry, and a peaceful emulation over the whole globe. Commerce may have its weak points, even its meannesses, but it cannot be denied that few of the occupations of man are more humanizing, or tend more to teach the value of peace and good-will; and if this be conceded, certainly nothing can more assist it than these great gatherings, in which each nation shows its own specialities, and gives to others the ideas which it has accumulated through its centuries of progress in industrial art. Like the social interchange of thought, this interchange of inventive genius brings out new talents; and succeeding generations will reap a rich harvest of results from our industrial exhibitions. To mark the advance in the arts of the interval, and promote manufacturing and commercial activity, an exhibition, on a still greater scale, was arranged to take place at Kensington, London, in 1862; in which were to be comprehended paintings in a high style from all countries. See *Official, Descriptive, and Illustrated Catalogue of the Great Exhibition of* 1851 (3 vols.); also *Reports by the Juries* (2 vols.); and the 13 vols. folio, printed by the commissioners.

Since the article on this subject first appeared in the *Encyclopædia*, several international exhibitions have been held—one in 1862 in London; the next in 1865 in Dublin; the third in Paris in 1867; in 1873, the great universal exhibition of Vienna; that of Philadelphia in 1876; etc. That of 1862, was held in a vast brick building, lighted by a roof and two immense cupolas of glass, designed by capt. Fowke, R.E., and erected on a large space of land acquired by the royal commissioners of the great exhibition of 1851, adjoining the beautiful garden of the horticultural society at South Kensington. The space covered was 1,291,800 sq. ft., or about 17 acres, including some portions of the buildings of the garden, lent by the horticultural society, for refreshment-rooms, etc. Of this vast space, 891,146 sq. ft. were occupied by objects exhibited, besides

284,670 sq. ft. of wall and other vertical space made by internal partitions, etc.: to which must be added 93,220 of horizontal and vertical space occupied by works of art, arranged in one of the most admirably constructed galleries ever designed for such a purpose. The entire cost of this gigantic affair was £321,000. This was secured against all risk of failure by a voluntary guarantee entered into by 1152 gentlemen of all ranks, who pledged themselves in various sums amounting, in the aggregate, to £450,000. Notwithstanding much opposition and ill-feeling, the international exhibition of 1862 proved a great success. Like its predecessor in 1851, it gave a vast impetus to trade generally, and it enabled the public to form correct opinions upon the progress of our manufactures, and their shortcomings when compared with others.

The next exhibition of importance was that held in Dublin in 1865, which was originated by a company, whose object was to establish the principle of decennial exhibitions, and, if possible, make this one pay the expense of erecting the magnificent building in which it was held, and thereby form a permanent home for such exhibitions and other useful purposes in future. This building was of brick, covered with stucco, and the roof of glass and iron, light but commodious galleries running entirely round the interior. The whole surface occupied by the structure was 5,700 sq. yards. It was, in every respect, well adapted for the purposes for which it was raised, and had an extensive pleasure-garden nearly surrounding it. The exhibition was successful in everything but its pecuniary results. It was amply patronized both by foreign exhibiters and visitors, and like that of 1862 in London, and the previous ones of Dublin and Paris, it combined fine arts with the manufactures, mining, and other industries.—The year 1867 witnessed, in Paris, the greatest, up to that time, of all international exhibitions, both with respect to its extent, and to the scope of its plan. Its site was on the Champ-de-Mars, the great military parade-ground of Paris, and it occupied the enormous space of 37 acres. It consisted of a large building of an elliptical form, arranged in twelve concentric circles, with a small open central garden. The outer circle was much more lofty and broader than any of the others, was roofed with corrugated iron, and lighted with clerestory windows, and was devoted to machinery of all kinds, and to the processes of manufacture in various branches of industry. Outside this circle were placed practical illustrations of the food department, in the form of restaurants of all nations —the exhibition of specimens of food substances being in small courts within the outer wall, or back to back with the restaurants. The first circle within that for machinery was for metallurgy, chemistry, dyeing, etc.; then followed textile materials, clothing, household furniture, personal ornaments, plate, porcelain, etc.; then matters relating to general and special education. Then came the gallery of fine arts, in which the paintings, sculpture, and other fine-art works of all nations were exhibited; and within this circle, again, was another, in which an archæological collection from each country was displayed, for the purpose of showing the rise and progress of industrial art in every country. This was a novel and most valuable addition, admirably conceived and carried out. Another most important feature in the Paris exhibition was the park, or out-of-door portion, which occupied by far the larger part of the whole space. In this were shown actual examples of the styles of domestic and palatial architecture of most countries, and even the tents of some of the nomad tribes, such as the Kirghis Tartars, and Samoyeds of the Russian empire, the Bedouin Arabs, etc. The beasts of burden of different nations, such as horses, camels, etc., were also shown, and all kinds of civil and military erections of general importance. The exhibition had great and deserved success; it was visited by most of the principal monarchs of the world, and vast multitudes of people. Pecuniarily, however, it did not succeed.

Since the Paris exhibition of 1867, there have been important ones held in Sweden (1868) and in Denmark (1872); at Moscow (1872); Vienna (1873); Philadelphia (1876); Paris (1878). And the English colonies of New South Wales and Victoria showed their enterprise and confidence in their resources by resolving on exhibitions at Sydney in 1879 and Melbourne in 1880.

The quasi-international Moscow exhibition of 1872 was organized by the Moscow polytechnic society, and merely patronized by the government. It was, however, on a large scale and admirably managed—its various buildings, etc., completely occupied the Alexandra gardens round two sides of the Kremlin, a length of over two English m., and the great riding-school. In its arrangement the greatest skill was shown, and its classification was the best and most scientific which has ever yet been attempted. Each special group of objects had separate buildings. Thus, for instance, medical science, which was fully represented, had a series of buildings, three model hospitals, besides those in the military department—all fully furnished—dispensaries, a pharmacien's shop, and a garden in which all the medicinal plants were growing; an exhibition of all kinds of surgical instruments and appliances, and a great variety of other matters appertaining to medicine and surgery; a dentist's establishment, with everything appertaining to dentistry, whether to the treatment of natural teeth, or the manufacture of artificial ones; and so on. Should ever a great international exhibition be carried out on the same grandly conceived plan, it will be the greatest educational effort possible.

The two Scandinavian ones in magnitude exceeded those held in Dublin; they were very interesting, and were under good management successful in all respects.

The Vienna exhibition of 1873 far exceeded in magnitude any previous one, and although unfortunate in many respects, was, upon the whole, an event of which Austria has good cause to be proud; and its ultimate results, there is every reason to hope, may show great commercial benefits, as it brought every civilized nation to Vienna, and doubtless will be the means of extending Austrian commerce, by making the general excellence and great variety of Austrian and Hungarian manufactures better known. The main building, which still remains, was the largest that had been constructed, being nearly four times the size of that in which the Paris exhibition of 1867 was held: it consists of a vast gallery or nave, 2,980 ft. in length, in the exact center of which is placed a great central hall, 426 ft. in diameter, covered with a conical iron roof and lantern rising to the height of 160 feet. At each extremity of the main avenue, another gallery, 660 ft. in length, is placed transversely to the chief one, and another of similar length crosses the nave at a distance of 114 ft. from each of these terminal transepts, whilst each of these pairs have their extremities connected by ranges of offices. Sixty-six ft. from the central rotunda on each side is a similar transept connected by two others parallel to the line of the main avenue, and thus forming a square inclosing the rotunda. Ten other transepts cross the main avenue; the height of all the galleries being about 50 feet. Vast as this structure was, it was found insufficient; and numerous halls and other annexes had to be built. The entire extent under roof is said to have exceeded 60 acres. A severe outbreak of cholera, and a deplorable monetary crisis occurring during the exhibition, marred its success.

The next great international exhibition was that of the United States of America, which was held in Philadelphia in 1876, in honor of the centenary anniversary of American independence. The main building was 1876 ft. long, and 464 ft. broad. The machinery-hall was 1400 ft. long, and in all no less than 190 buildings were erected for the purposes of the exhibition. The work of preparation and building occupied 21 months. Between the 10th of May, when the exhibition was inaugurated with elaborate ceremonies, till Nov., it was estimated that no fewer than 8,000,000 paid for admission. Both commercially and in other respects, this memorable enterprise was very successful.

The French nation gave a remarkable illustration of the elasticity of its energy and the wealth of its resources, by undertaking an international exhibition at Paris in 1878, but a few years after national calamities unparalleled in recent history. And the enterprise met with success greater than could have been anticipated. Opened on the 1st May, by the president, marshal MacMahon, it was visited ere its close in Oct., by multitudes from all civilized lands. The huge building erected for the display in the Champ de Mars, was called the Palace du Trocadéro, and is designed to be permanent. The close was marked by a lottery on a very large scale, the innumerable prizes being selected chiefly from among the exhibits.

EXMOOR FOREST, a moory, mostly uncultivated waste, consisting of dark ranges of hills and lonely valleys, 14 sq.m. in area, in the w. of Somersetshire and n.e. of Devonshire. It is bordered by deep wooded glens. The hills rise in Dunkery Beacon to 1668 ft., in Chapman Barrow to 1540, and in Span Head to 1510. Devonian slates, with some new red sandstone in the n., from the substratum. It is covered with heath, interspersed with juniper, cranberry, and whortleberry, with much meadow-land. Throughout this tract there is a native breed of ponies, known as Exmoor ponies, reputed to be stout and hardy. Since 1851, E. has become an iron-mining district. The river Exe, and its tributary the Barle, rise in Exmoor. It is subject to winds and mists.

EXMOUTH, a t. in the e. of Devonshire, on the left bank of the mouth of the Exe, 10 m. s.e. of Exeter. It stands at the base and on the slope and top of a hill rising from the sandy estuary of the Exe. It is noted for its mild climate. From about 1700, it was the chief watering-place on the Devon coast, till the rise of Torquay. There is a fine promenade on a sea-wall 18 ft. high. The Woodbury Hills on the e., 800 ft. high, protect it from the e. winds. Here Sueno the Dane landed in 1003. It was taken by the royalists in 1646. Pop. '71, 5,614.

EXMOUTH, EDWARD PELLEW, Viscount, a famous naval commander, was b. at Dover, April 19, 1757. He entered the navy when 13 years of age, and first attracted notice by his gallant conduct in the battle on lake Champlain, Oct. 11, 1776. In 1782, he attained the rank of post-capt. In 1793, having been appointed to the command of the *Nymphe*, a frigate of 36 guns, he encountered, and, after a hard fought battle, captured *La Cleopatre*, a French frigate, which carried the same number of guns. For this victory, he was knighted. In 1799, he received the command of the *Impétueux*, 78 guns, and was sent to the French coast, where many of his most brilliant actions took place. In 1804, sir E. Pellew was advanced to the rank of rear-admiral of the red; in 1808, to that of vice-admiral of the blue; and in 1814, he was raised to the peerage, with the title of baron E. of Canonteign, Devonshire, with a pension of £2,000 a year. In 1816, he was sent to Algiers, to enforce the terms of a treaty regarding the abolition of Christian slavery, which the dey of Algiers had violated. With a combined fleet of 25 English and Dutch vessels, he bombarded the city for seven hours, and inflicted such immense damage, destroying all the Algerine fleet and many of the public buildings,

that the dey consented to every demand. E., who had been wounded in the leg and cheek in this action, received on his return to England the thanks of both houses of parliament, and was promoted to the rank of viscount, 10th Dec., 1816. In 1821, he retired from public service, loaded with honors. He died 23d Jan., 1833.

EXOCETUS. See FLYING-FISH.

EXODUS ("the departure"), the name given to the second book of the Pentateuch. It may be regarded as composed of two parts—the first historical, and the second legislative. The historical extends to the end of the 18th chapter. It embraces a narrative of the various preparations, natural and supernatural, made under the providence of God for the deliverance of the Israelites from their bondage in Egypt, and also describes the accomplishment of their deliverance, and the journeyings of the people in the wilderness as far as Mt. Sinai. The legislative is devoted to a minute and elaborate account of the institution of the theocracy. The book presents us with three aspects of Hebrew history. We have, first, a picture of a people enslaved; second, of a people redeemed from bondage; and third, of a people sanctified and set apart to the service of God. The period embraced by the history of the book is usually reckoned at 142 or 145 years, which number is obtained as follows: From the death of Joseph to the birth of Moses, 60 or 63 years; from the birth of Moses to the departure from Egypt, 80 years; and from the departure out of Egypt to the erection of the tabernacle, 1 year. It cannot be denied, however, without wildly violating all the ordinary laws of the increase of population, that this is much too short a period to account for the existence of such a number of Hebrews as left Egypt—viz., 600,000, exclusive of women and children—i.e., in all, at least, 2,500,000. Those who went down into Egypt with Jacob were "threescore and ten souls," and in 215 years, these, though prohibited from intermarrying with the Egyptians, had amounted to between two and three millions. The writer of E., indeed, says (chapter xii., verse 40) that "the sojourning of the children of Israel, who dwelt in Egypt, was 430 years," adding that they left the land "even the self-same day" on which they had entered it. This statement, however, does not seem to harmonize with the author's previous narrative, and is certainly inconsistent with the language of the apostle Paul, who says (Gal. iii. 17) that the law was given 430 years after the covenant with Abraham, which took place about 215 years before Jacob and his sons went down into Egypt, so that, according to this view, the Israelites could only have been in Egypt 215 years. This is the number commonly accepted; but it is not wonderful that some writers should affirm that "it would be more satisfactory if we could allow 430 years for the increase of the nation in Egypt rather than any shorter period." A still longer period would undoubtedly afford additional satisfaction; and Bunsen, in his *Ægypten's stelle in der Weltgeschichte*, endeavors to show that the Israelites were in Egypt for *fourteen* centuries instead of two, and that the number 215 only indicates the period of oppression, the time when they were "evilly entreated." This conclusion is, of course, arrived at by the application of principles of criticism not generally recognized in the schools of British theology; but there seems no avoiding the conclusion, that the usual chronology is hopelessly wrong.

May it not be that the interval which elapsed between the death of "Joseph and all his brethren, and all that generation" (E. i. 6), and the period when there arose up a new king over Egypt which knew not Joseph (E. i. 8), was much longer than we suppose? The passage itself in E. seems to favor this idea; for the intervening verse (E. i. 7) speaks of the children of Israel "increasing and multiplying, and waxing exceeding mighty, and filling the land," without any reference at all to the time occupied in this process; and such words are certainly more applicable to a series of centuries than of years, while centuries, besides, would harmonize better than years with the statement that the Egyptian king knew not (i.e., had forgotten all about) Joseph. The only grave objection to this otherwise extremely probable hypothesis, is its incompatibility with the statement of St. Paul; an objection, however, which Luther would not have found insurmountable, for in an exactly similiar case he said of the inspired Stephen that "he was no historian, and did not trouble himself about particulars."—*Zu Apostelgesch.* vii. Bd. 1, 1160.

In explanation of the chronological difficulty, the confusion resulting from the use of *letters* as numerals in Hebrew MSS. has been urged; and this is notoriously a fertile source of error and contradiction, which rationalistic critics have not sufficiently kept in mind. To adduce such a reason, however, would be unavailing in the present case; for if it could be proved that the period stated in E. may have been abbreviated through the negligence of some careless transcriber, or otherwise, and thus an approximation be made to the *fourteen* centuries of Bunsen, this would only place the writer of the Pentateuch in more visible antagonism with St. Paul himself. The date of the exodus is fixed by Usher at 1491 B.C.; by the Septuagint, at 1614 B.C.; by Hales at 1648 B.C.; by Wilkinson, about 1495 B.C., in the reign of Thothmes III.; and by Bunsen, as late as 1320 or 1314 B.C., in the reign of Menephthah, in the latter of which years Manetho gives what appears to be the Egyptian version of the event. The genuineness and authenticity of the book of E. have been sharply criticised in modern times; but in fact, as early as the time of Josephus (*Ant.*, ii. 16), there were Jews who looked upon the miracle of the crossing of the Red sea, etc., as fabulous. Among the theologians

who have questioned the integrity of E., are Von Lengerke, Stähelin, De Wette, Knobel, and Colenso, who find traces of an older and a later author, the former of whom they call Elohistic, and the latter Jehovistic. Their objections have been replied to by Hengstenberg, Hävernick, etc., who endeavor to show that the distinction is artificial, and the attempt to follow it out in detail a failure. See PENTATEUCH.

EXOG'ENOUS PLANTS, or EXOGENS (Gr. *exo*, outwards; *gennao*, to produce), are those in which the woody substance of stem increases by bundles of vascular tissue added externally. The exogenous stem contains a central *pith* (q.v.), from which *medullary rays* proceed to the bark (q.v.), and the bark is very distinct from the fibro-vascular or woody part which it surrounds. The exogenous is thus very different in structure and manner of growth from the endogenous or the acrogenous stem. Amidst the cellluar substance of the young stem, when it has developed itself from the seed, woody cords are seen connecting the cotyledons, and afterwards the leaves, when these appear, with the root, in the central axis of which they join. A section of the stem exhibits the cellular substance traversed by vascular bundles (woody fiber), which in the section are more or less wedge-shaped, radiating from the center, but yet not prolonged into the center itself, which, even to the greatest age of the stem, remains occupied by the cellular pith. Additional bundles are interposed, as growth proceeds, diminishing the proportion of cellular substance in the stem, yet without these bundles ever becoming so compacted together as to cut off the communication between the cellular center of the stem and its bark, which is maintained by means of the medullary rays, often, indeed, imperceptible to the naked eye, but always present even in the hardest and most close-grained wood. The woody layers which are formed in successive years, as new leaves and branches are developed, are formed amidst the *cambium* (q.v.), into which the woody fibers of the new leaves descend, between the bark and the former wood. Thus the concentric circles are formed, usually one for each year's growth, distinguishable even in the most matured timber, and by which the age of trees is very commonly computed. The beginning of each new layer is generally marked by a greater abundance of *porous vessels*, the openings of which are conspicuous in the transverse section. In pines, the line of separation between the layers is marked by greater density of texture, and often by deeper color. The age of trees cannot, however, be calculated with perfect certainty from the concentric circles of the stem, as any circumstance which temporarily arrests the growth in any summer, may produce an effect similar to that ordinarily produced by the change of seasons; whilst in the trees of tropical countries, at least where the wet and dry seasons are not very marked, concentric circles are often not to be discovered.

The structure of the branch of an exogenous tree perfectly corresponds with that of the stem. The vascular bundles of the stem or branch form a loop where a leaf begins, and those of the leaf and its axillary bud spring from the loop. The roots of exogenous plants have not a central pith like the stem, but in a few trees, as the horse-chestnut, the pith is prolonged to some extent into the root.

Anomalies are not unfrequently to be met with in the structure of exogenous stems, and particularly among the twining woody plants of tropical countries. There are also very many herbaceous plants, in which, although the structure agrees with that of an exogenous tree in its first year, no further development is ever attained; whilst in many, even this is very imperfectly reached; but yet these are on other accounts unhesitatingly classed with exogenous plants. The exogenous stem and dicotyledonous seed are so constantly found together, that the designation exogenous plants is often applied to that great division of the vegetable kingdom, which is also called dicotyledonous. See BOTANY. Exogenous plants are also characterized by a particular mode of germination, with reference to which they are called *exorhizal* (Gr. *exo*, outwards; *rhiza*, a root), the radicle simply lengthening, and not having to break through the coat of the embryo. The leaves of exogenous plants generally exhibit a net-work of veins, instead of the parallel veins characteristic of endogens, and a greater proportional breadth of leaf usually accompanies this reticulated venation.

Exogenous plants are far more numerous than endogens. All the trees and shrubs of Britain, and those of temperate and cold climates generally, are exogenous, as well as very many herbaceous plants of these parts of the world, and many trees, shrubs, and herbaceous plants of the tropics. Almost all trees, except palms and a few *liliaceæ*, *pandanaceæ*, and tree-ferns, are exogenous.

EXORCISM (from *exorkizo*, to conjure), i.e., conjuration in the name of the gods, the term used by the fathers of the church to denote the act of conjuring evil spirits, in the name of God or Christ, to depart out of the person possessed. The first Christians adjured evil spirits in the name of Jesus Christ, who had conquered the devils; but as the opinion was at the same time entertained, that all idolaters belonged to the kingdom of Satan—who suffered himself to be worshiped under the form of idols—it was customary to exorcise heathens previous to their receiving Christian baptism. After Augustine's theory of original sin had found acceptance in the 5th c., and all infants were regarded as belonging to Satan's kingdom, E. became general at the baptism even of Christian children. Following the practice of the Roman Catholic church, Luther retained E., but it was laid aside by the Reformed church. Although abandoned by

illustrious and orthodox Protestant theologians, such as Chemnitz and Gerhard, or deemed unessential, and in modern times done away with by the "Protestant" church, the practice has been recently revived by the Old Lutheran or High-church party.

In the Catholic church, the function of E. belongs peculiarly to one of the so-called "minor orders." See ORDERS. Our Lord having not only himself in person (Matt. ix. 32, Mark i. 25, Luke iv. 35, viii. 29) cast out devils, but having also given the same power to his disciples, it is believed to be permanent in the church. Of its exercise in the early church, both in relation to "energumens," or persons possessed, and in the administration of baptism, there are numerous examples. Tertullian and Origen speak of it as of ordinary occurrence, and the council of Carthage, in 255, alludes to its use in baptism. The rite of E. is used by the modern church in three different cases: in the case of actual or supposed demoniacal possession, in the administration of baptism, and in the blessing of the chrism or holy oil, and of holy water. Its use in cases of possession is now extremely rare, and in many diseases is prohibited, unless with the special permission of the bishop. In baptism it precedes the ceremony of applying the water and the baptismal form. It is used equally in infant and in adult baptism, and Catholic writers appeal to the earliest examples of the administration of the sacrament as evidence of the use of E. in both alike. The rite of baptismal E. in the Roman Catholic church follows closely the scriptural model in Mark viii. 33. The exorcisms in the blessing of the oil and water resemble very closely the baptismal form, but are more diffuse.

EXOSMOSE. See ENDOSMOSE.

EXOSTEMMA, a genus of American trees and shrubs of the natural order *cinchonaceæ*, nearly allied to *cinchona*. Several species yield febrifugal barks, which, however, do not contain the cinchona alkaloids. The most valued of these barks are caribbee bark (q.v.) and Saint Lucia bark, the latter of which is the produce of *E. floribunda*, a native of the more mountainous parts of the West Indies.

EXOSTOSIS (Gr. *ἐξ*, out of, and *ὄστεον*, bone), a bony tumor growing from some of the osseous structures of the body. See TUMOR.

EXOTERIC. See ESOTERIC.

EXOTIC PLANTS, or EXOTICS (Gr. coming from abroad), cultivated plants originally derived from foreign countries. The term is most frequently applied to those of which the native country differs so much in soil or climate from that into which they have been conveyed, that their cultivation is attended with difficulty, requiring artificial heat or other means different from those requisite in the case of indigenous plants. The cultivation of many such exotics is carried on with great success in our greenhouses and hot-houses; but there are a few which, notwithstanding all the care of the gardener, can almost never be made to flower, and others which, although they flower, seldom produce ripe fruits and seeds. Nor are difficulties of this kind experienced only in the cultivation of those which belong to warmer climates than our own, but sometimes even with the natives of colder regions; thus, the delicious fruit of the *rubus arcticus*, abundant in the most northern parts of Europe, is scarcely ever to be seen in the gardens of Britain, although the plant grows with sufficient luxuriance.

EXPANSION. See HEAT.

EXPATRIATION, a voluntary change of residence and allegiance from one's native land to another country and government. Despotic governments have assumed the right to forbid such a change on the part of their citizens, but the United States recognizes the right of the individual citizen, at his own pleasure, to leave the country of his birth and make his home in a foreign land. Naturalization, however, is necessary to the complete transfer of allegiance. The United States defends the rights and liberties of naturalized, precisely as it does those of native citizens. A naturalized citizen of this country, visiting his native land, is protected by the American flag as though he had been born on American soil. Of course, this right of expatriation cannot be made a cover for a previous breach of trust, or the commission of any crime, in the place of one's birth; but the assumption that the law of his native land requiring him at a certain time of his life to do military duty, nullifies for the time being a man's right of expatriation, is not allowed by the United States. Thousands of young men leave the old world for the avowed purpose of avoiding military conscription, and the United States welcomes them to citizenship, with all its rights and obligations.

EXPECTATION (Lat. *expectatio*, a waiting, or looking out), i.e., the treatment of disease without active remedies, by simply observing its progress and averting its consequences through physiological means; as, for instance, when a fracture (q.v.) is treated by keeping the ends of the broken bone in their proper place, until the natural processes of repair are completed. E. is in this and other cases obviously a quite different thing from inaction, or the systematic doing of nothing, with which it has been sometimes confounded.

EXPECTATION OF LIFE. See PROBABILITY.

EXPECTATION WEEK is the name given to the period elapsing between Ascension day and Whitsunday, because during this time the apostles continued praying in earnest expectation of the Comforter.

EXPECTORANTS (Lat. *ex*, out of, and *pectus*, the breast), medicines given to carry off the secretions of the air-tubes. See BRONCHI, BRONCHITIS. The principal E. are antimony, squill, ipecacuanha, senega, balsam of tolu, lobelia, gum ammoniac, asa-fœtida, galbanum, etc.

EXPECTORA'TION (see EXPECTORANTS), the mucus or other secretion discharged from the air-passages. The examination of E. is of the utmost value in the diagnosis of diseases of the chest, as will be seen in their separate description. See CHEST, BRONCHITIS, PNEUMONIA, CONSUMPTION, etc.

EXPENSES or COSTS OF A LAWSUIT. The arrangements adopted in England with reference to charges exigible from the parties to lawsuits are stated under COSTS. In Scotland, these charges are commonly spoken of as expenses, and in the present article we shall, consequently, confine ourselves to the Scottish practice. In addition to demanding payment of the sum claimed, or performance of the alleged obligation where it has no reference to a pecuniary transaction, the pursuer of an action at law in Scotland almost always asks the court to pronounce decree in his favor for the expense of the proceedings which he has found it, or may find it, necessary to institute. On the other hand, the defender usually demands the expense attending his defense; and the general rule is, that the party found ultimately to be in the wrong has decree pronounced against him for the expense which he has occasioned to his opponent, as well as for the subject-matter of the suit. As it is quite usual for a party to succeed in one branch of his action, and to fail in another; or to occasion unnecessary expense by the unskillful or careless mode in which he conducts some portion of it, even though on the whole he be in the right; the adjustment of the amounts incurred by the parties respectively often involves not only much nicety of calculation, but questions of very considerable legal difficulty. In so far as the adjustment of expenses is a matter of calculation, it is effected by the auditor of the court of session, or of the interior courts. See AUDITOR and SHERIFF. In so far as it involves questions of law, these, if not previously decided by the judge, must be carried back to him from the auditor. If either party means to object to the amount awarded to him by the auditor in his report, he must lodge with the clerk of the process a short note of his objections without argument. A copy of this note must be furnished to the agent for the opposite party, and the court, or the lord ordinary, before whom the action depended, may direct the objections to be answered either *vivâ voce* or in writing. Should the objector fail to make good his objection, the expense of discussing it will be laid on him. If the objection has been stated to the auditor, and he has reported it to the court, it does not follow that the expense of discussing it will be laid wholly on the objector, even if unsuccessful. Where an appeal to the house of lords has been actually presented, and service of an order thereon has taken place, a motion for expenses is incompetent, but a mere intimation of an appeal is not enough to prevent decree for expenses being pronounced. If the agent who has conducted the cause wish it, the decree for expenses will be pronounced in his favor; and the party found liable will not be allowed to plead a counter-claim against the client, as by that means he might prevent the agent from recovering what he very probably has disbursed. The taxation of expenses is said to be between *party* and *party*, and not between agent and client; that is to say, the losing party has to pay only the expenses which have been necessarily incurred in discussing the question between the parties judicially, not the unnecessary expenses which the over-anxiety of the successful party may have led him to incur to his own agent. Practically, there are very few cases in which the expenses recovered do cover all the *boná-fide* claims of the agent against his client, which is the chief reason why litigation is always attended with expense, even to the winning party.

EXPERIMENT and observation are the means by which we extend and confirm our knowledge of nature. An E. is properly a proceeding by which the inquirer interferes with the usual course of a phenomenon, and makes the powers of nature act under conditions that, without his interference, would never, perhaps, have presented themselves all together. The introduction of E. distinguishes the modern method of investigating nature from that of ancient times and of the middle ages. It is by this means that physics and chemistry have made such rapid strides within the last two centuries. Through E., the investigator becomes master of the phenomena he is considering; for he can contrive to set aside the unessential circumstances that so often conceal the real relations and conditions of things, and make these come out into the light. Experiments exhibited during a lecture on any branch of science are made, not with a view to the discovery of truth, but to aid in the exposition of truths already discovered; they are sometimes called demonstrative experiments.

EXPERT (Lat. *expertus*, from *ex* and *peritus*, specially skilled), a man of special practical experience or education in regard to a particular subject—a word commonly applied (after the French) to medical or scientific witnesses in a court of justice, when selected on account of special qualifications, as in the case of an analysis of the con-

tents of the stomach in suspected poisoning. The term is similarly applied to a person professionally skilled in hand-writing, for detection of forgery of deeds and signatures.

EXPIATION OR ATONEMENT, DAY OF, among the Jews, is the 10th day of the month Tisri (corresponding to a part of our Sept. and Oct.), observed annually as a day of humiliation and atonement for national sin: the only day of national humiliation which Moses prescribed. The commandment to observe it was three times solemnly given, and the religious ceremonies peculiar to it were definitely ordained. All the people were required to refrain from work as strictly as on the Sabbath, and to afflict their souls in remembrance of their sins. In this humiliation fasting was probably designed to be included, and has been strictly practiced. The chief significance of the observance, as also its heaviest burden, centered in the high-priest as the representative of the nation before God. 1. The seven previous days were spent by him in nearly total separation from all other persons, and in careful preparation for his special duties. 2. "During the whole of the seven days, as well as on the day of atonement" (according to the statements of the rabbins) "the high-priest had to perform the ordinary sacerdotal duties of the daily service himself." 3. It was the only day of the year in which even he was allowed to enter the most holy place. 4. He was clothed in the linen priestly vestments instead of the splendid robes which at other times distinguished him. 4. He offered sacrifice first for himself and his house, sprinkling the blood and burning incense before the mercy-seat. 5. He took two goats for the sin-offering in behalf of the people, presenting both before the tabernacle, and having cast lots to determine which one should die, sacrificed it on the altar and carried its blood within the veil; then having confessed over the head of the living goat all the sins of the people, he sent it away under the charge of a trusted man to be set free in an uninhabited part of the wilderness. By this double offering as parts of one sacrifice the two great facts of redemption were represented: 1st, that an atonement for sin was made to God; and 2d, that the burden of sin was removed from man. In modern times the Jews continue to observe the day, beginning the ceremonies with what can be regarded, at best, as only a mournful parody on the offering of the scape-goat, fasting strictly through the day, and closing the service by reading the Scripture command for sacrifices which they can no longer bring.

EXPLOITS, RIVER OF, one of the largest rivers in Newfoundland, rising in the s.w. part of the island and running n.e. to the bay of Exploits, into which it falls about 49° n. and 52° w. Steamers go up 12 m., and small boats can pass to within 50 m. of the s.w. coast. The valley is fertile and abounds in game, being sparsely settled as yet, and the river is bountifully supplied with fish.

EXPLOSIVES. There is a question as to the influence, direct or indirect, upon modern civilization of the introduction of explosive agents for the purpose of war. Some eminent authors have gone so far as to consider the invention of gunpowder as next in importance, in its ultimate effects, to those of printing and the application of steam power. However this may be, it is well to remember that explosive substances are now of immense utility in the arts of peace; indeed, it is not too much to say that without their aid many of the great engineering enterprises of the present day would either be impossible, or else have to be carried out at a vast additional expenditure of time and labor. The germ of all the knowledge which we possess of explosive reaction undoubtedly lay in the probably accidental discovery, many ages ago, of the deflagrating properties of the natural substance niter or saltpeter (KNO_3), when in contact with incandescent charcoal. By distilling niter with oil of vitriol, the alchemists obtained a corrosive fluid which they called *aquafortis*, now known as nitric acid (HNO_3), which parts with its oxygen even more rapidly than saltpeter; so that if the strongest nitric acid be poured upon finely powdered charcoal, the latter takes fire at the ordinary temperature. Somewhat less than half a century back, it was discovered by some French chemists that upon treating various organic substances, such as starch, the sugars, cotton fabrics, and even paper, with concentrated nitric acid under proper precautions, the chemical constitution of the substances underwent a great change, and they became endowed with violently explosive properties, while remaining for the most part unaltered in external characteristics. To this discovery we owe a distinct class of explosive compounds, the most powerful for practical purposes as yet known.

Examining into those principles of constitution and action which are more or less common to all explosive substances, we may define, for our purpose, the term "explosive" as the sudden or extremely rapid conversion of a solid or liquid body of small bulk into gas or vapor, occupying very many times the volume of the original substance, and, in addition, highly expanded by the heat generated during the transformation. This sudden or very rapid expansion of volume is attended by an exhibition of force, more or less violent according to the constitution of the original substance and the circumstances of explosion. Any substance capable of undergoing such a change upon the application of heat, or other disturbing cause, is called "explosive." The most explosive substances that are practically the most important essentially contain carbon, oxygen, and nitrogen, the last always existing in a state of feeble combination with the whole or part of the oxygen, and thus creating that condition of unstable chemical equilibrium which is necessary. When explosion takes place, the nitrogen parts with

its oxygen to the carbon, for which it has a greater affinity, forming carbonic acid (CO_2) and carbonic oxide (CO) gases, the combination being accompanied with great generation of heat, and the nitrogen is set free. In most explosives there is also hydrogen accompanying the carbon, and by its combustion producing an extremely high temperature; it combines with part of the oxygen to form water in the form of greatly expanded vapor. Other subordinate elements are often present; in gunpowder, for instance, the potassium binds the nitrogen and oxygen loosely together in the state of saltpeter, and there is sulphur, a second combustible, whose oxidation evolves greater heat than that of carbon. When chlorate of potash is present, the chlorine plays the part of nitrogen, and is set free in the gaseous state. Two very unstable and practically useless explosive substances, the so-called chloride and iodide of nitrogen, contain neither carbon nor oxygen; but their great violence is equally caused by the feeble affinities of nitrogen for other elements, large volumes of gaseous matter being suddenly disengaged from a very small quantity of a liquid and solid body respectively.

Explosives may be conveniently divided into two distinct classes—(1) explosive mixtures, and (2) explosive compounds. The first class consists of those explosive substances which are merely intimate mechanical mixtures of certain ingredients, and which can be again separated more or less completely by mechanical means, not involving mechanical action. These ingredients do not, as a rule, possess explosive properties in their separate condition. There are, however, explosives which might almost be classed in both categories; for example, *picric powder* is composed of ammonium picrate and saltpeter, the former of which contains an explosive molecule, but is mixed with the latter to supply additional oxygen, and thus increase the force. If a substance that will burn freely in air, combining gradually with the oxygen of the atmosphere, be ignited in pure oxygen gas, the combustion will be much more rapid, and the amount of heat generated greater, at the ordinary atmospheric pressure. If it be possible to burn the substance in a very condensed atmosphere of oxygen, we can readily imagine the combustion as very greatly accelerated, and therefore increased in violence; this is what is ordinarily effected by an explosive "mixture." A combustible body and a supporter of combustion are brought into extremely close contact with one another by means of intimate mechanical mixture; also, the supporter of combustion, or oxidizing agent, is present in very concentrated form, constituting what may be termed a magazine of condensed oxygen, solid or liquid. In the case of the explosion of a definite chemical compound, the change may be considered as the resolution of a complex body into simpler forms. This is not, however, always the case when a mechanical mixture is concerned; gunpowder, for example, may be said to contain two elementary substances, carbon and sulphur, not in chemical union.

The chief explosive mixtures may be subdivided into "nitrate mixtures" and "chlorate mixtures." In the nitrates, the oxygen is held in combination with sufficient force to need a powerful disturbing cause to separate it, so that mixtures made from nitrates do not explode very rapidly, and their action is comparatively gradual; they are not sensitive to friction or percussion, and hence are to a great extent safe. Any of the nitrates will form explosive mixtures with combustible substances, but nitrate of potash (KNO_3) is the only one practically employed. The nitrate of soda, called "cubical" or Chili saltpeter, has been used, but absorbs moisture from the air so readily as to give very inferior results. Gunpowder may be taken as the representative of the nitrate explosive mixtures. Picric powder, above referred to, has been proposed by Abel for use as a bursting charge for shells, as being more powerful than a corresponding charge of gunpowder, equally safe as regards friction or percussion, and less hygroscopic; it consists of two parts ammonium picrate, and three parts saltpeter, incorporated, pressed, and finished very much as ordinary gunpowder.

The chlorates part with their oxygen far more readily than the nitrates, the strong affinities of chlorine for the metals coming into play, and consequently chlorate mixtures are very sensitive to friction and percussion, and explode with great violence; chlorate of potash, ($KClO_3$) is the only one used. Very many chlorate mixtures have been made, some of which are employed in fireworks. "White gunpowder" is a mixture of two parts chlorate of potash, one of yellow prussiate of potash, and one of sugar; it is exploded very easily by friction or percussion. The most important chlorate mixtures are those used for igniting other explosives, such as the composition for friction tubes for firing cannon, percussion-cap composition, and percussion fuses for bursting shells on impact; it is sometimes mixed with sulphur, as a combustible, and sometimes with black sulphide of antimony, which gives a longer flame.

In an explosive "compound," the elements are all in chemical combination, presenting a definite explosive "molecule," which contains, so to speak, both the combustible and the supporter of combustion, in the closest possible union; we can therefore understand its action being much more sudden and violent than that of the most intimate mechanical mixture. The chief explosive compounds are formed from some organic substance containing carbon, hydrogen, and oxygen, by introducing into it, through the action of concentrated nitric acid, a certain portion of nitric peroxide (NO_2), in substitution for an equivalent amount of hydrogen. A new compound, differing outwardly very little, if at all, from the original substance, is thus formed, but in a very unstable state of chemical equilibrium, because of the feeble union of the nitrogen

and oxygen in the NO_2 molecule. A slight disturbing cause brings into play the stronger affinity of the carbon and hydrogen for the large store of oxygen contained in the new compound. Gun-cotton and nitro-glycerine are the leading members of this group, being produced in a precisely similar manner, by the substitution of three molecules of NO_2 for three atoms of hydrogen (H). As those explosives will be elsewhere described in detail, we give the formation, as a representative member of the group, of nitro-phenol, or picric acid, by treating phenol, or carbolic acid, with a mixture of nitric and sulphuric acids, the latter being required to absorb the water and preserve the full strength of the nitric acid:

Carbolic acid.		Nitric acid.		Picric acid.		Water.
C_6H_6O	+	$3HNO_3$	=	$C_6H_3(NO_2)_3O$	+	$3H_2O$

The formula of the product may be empirically written $C_6H_3N_3O_7$; it is, like gun-cotton and nitro-glycerine, a *tri-nitro* substitution product. Only the picrates, or salts of picric acid formed with potassium or ammonium, are used in practice, as possessing more force than the uncombined acid. From starch may be obtained, in a strictly analogous manner, an explosive called *xyloidine*, which is a *bi-nitro* product, two molecules of nitric peroxide being substituted for two atoms of hydrogen. In the case of *nitro-mannite*, an explosive made from mannite, one of the sugars, as many as six molecules of the NO_2 are inserted. The number of nitro-substitution products is very great, many of them being more or less violently explosive. The fulminates are among the most violent of all explosive compounds, their chemical sensibility being very small. Sudden in action, their effect is great locally; thus they are well adapted to the purpose, for which alone they are practically used, of igniting or upsetting the equilibrium of other explosives. Fulminate of mercury is produced by adding alcohol (C_2H_6O), under great precautions, to a solution of mercury in nitric acid; a gray crystalline precipitate is obtained, very heavy (sp. gr. 4.4), and so sensitive to friction or percussion that it is kept in the wet state. The results of analysis show one atom of mercury, and two each of carbon, nitrogen, and oxygen; so that the formula may be empirically written $HgC_2N_2O_2$, or perhaps more correctly $HgO.C_2N_2O$; the chemical factor C_2N_2O is called *fulminic acid*, but has never been produced separately. Opinions differ as to the precise "rational" formulæ of the fulminates, some chemists considering their process of formation to be similar to that of the nitro-substitution products. It will be observed that two atoms of nitrogen take the place of hydrogen, being the ratio of combining proportions of those elements. The products of combustion are carbonic oxide, nitrogen, and metallic mercury, and the violence of action is due to the sudden evolution of a volume of gas and vapor very large in comparison with that of the substance, its density being so great. This fulminate enters into the composition used for percussion caps and electric fuses; its practical value has of late years been immensely increased by the discovery of its power, even in very small quantities, to produce the almost instantaneous decomposition of several explosive substances. Fulminate of silver is prepared in a similar manner, but, being far more sensitive, is of little practical value; it is employed, in very minute quantities, in making such toys as detonating crackers.

It may be generally concluded that the amount of force exerted by an explosive substance depends upon (1) the *volume of gas or vapor* produced by the transformation, compared with that of the original substance; and (2) the *temperature of explosion*, which determines the extent to which the gases are expanded, or their tension increased; or, in other words, the explosive force is directly proportional to the heat of combustion, and the volume of gas and vapor calculated at 0° C. and 7.60 mm. pressure, and *inversely* proportional to the specific heat of the mixed products. It has been supposed by Berthelot and others that the volume of gas produced may possibly be still further increased by the partial or total "dissociation" of the compound gases, at the high temperatures concerned; for example, that the carbonic acid (CO_2) may be decomposed into carbonic oxide (CO) and oxygen, or the aqueous vapor into oxygen and hydrogen. However, Nobel and Abel demonstrate that, in the former instance, the loss of temperature, consequent upon the absorption of heat by the decomposition, would more than compensate for the increase of volume by dissociation. It must also be remembered that, if the temperature be extremely high, so also is the pressure under which dissociation must take place. We may therefore consider that it has no sensible influence upon the explosive force.

It is most important to distinguish between explosive force and explosive effect, the latter in great measure depending upon the rapidity with which the metamorphosis takes place, while the same amount of force may be exerted suddenly or gradually. We may, therefore, consider that the explosive effect varies *directly* as the volume of gas produced and the temperature of explosion, and *inversely* as the time required for the transformation. But the time, and, to a certain extent, the products and temperature, will vary with (*a*) the physical state of the explosive substance; (*b*) the external conditions under which it is fired; (*c*) the mode of firing or exploding.

The physical or mechanical state of the explosive substance has a most important bearing upon the effect obtained from it. To prove this, it is only necessary to point to the very different results given by gunpowders made with the same proportions of the three ingredients, but varying in density, and in shape and size of grains or pieces.

Gun-cotton is even more affected by variations in mechanical condition. In the form of loose wool, it burns so rapidly that gunpowder in contact with it is not inflamed; plaited or twisted tightly, its rate of combustion in air is greatly modified. This is due to the fact that the inflammable carbonic oxide, which is evolved by the decomposition from the want of sufficient stored-up oxygen to oxidize completely all the carbon of the gun-cotton, cannot penetrate between the fibers and accelerate the combustion, but burns with a bright flame away from the surface of the twisted cotton: when the yarn is yet more compressed by any means, the temperature is not kept up to the height necessary for the combustion of the carbonic oxide, so that it escapes unconsumed, abstracting heat, and yet more retarding the rate of burning. For the same reason, pulped and compressed gun-cotton burns comparatively slowly in air, even when dry; in the wet state, it merely smolders away, as the portion in contact with the fire successively becomes dried. Yet this same wet compressed gun-cotton can be so used as to constitute one of the most powerful explosives known.

It is well known that gunpowder behaves differently when in the open air and under strong confinement; not only the rate of burning, but even, to a certain extent, the products of combustion are altered. We have discussed the effect of tightly plaiting or compressing gun-cotton; but when confined in a strong envelope, the whole of the inflamed gas, being unable to escape outwards, is forced into the interstices under immense pressure, and the decomposition is greatly accelerated. The amount of confinement or restraint needed by any explosive depends, however, upon the nature of the substance and the mode of exploding it, becoming very much less as the transformation is more rapid, until it may be said to reach the vanishing-point. For example, the very violent explosive chloride of nitrogen is usually surrounded, when exploded, with a thin film of water. Abel states that if this film, not exceeding $\frac{1}{1000}$ in. in thickness, be removed, the explosive effect is much lessened. Nitro-glycerine, again, when detonated by a fulminate, is sufficiently confined by the surrounding atmosphere. By the same means, gun-cotton may be exploded unconfined, if compressed, the mechanical cohesion affording sufficient restraint. In the case of wet compressed gun-cotton, which can be detonated with even fuller effect than dry, the mechanical resistance is greater, the air-spaces being filled with incompressible fluid.

The manner in which the explosion is brought about has a most important bearing upon the effect produced. This may be done by the direct application of an ignited or heated body, by the use of an electric current to heat a fine platinum wire, or by means of percussion, concussion, or friction, converting mechanical energy into heat. A small quantity of a subsidiary explosive, such as a composition sensitive to friction or percussion, is often employed, for the sake of convenience, to ignite the main charge, the combustion spreading through the mass with more or less rapidity, according to the nature of the substance.

Although subsidiary or initiatory explosives were at first used merely to generate sufficient heat to ignite the charge, and are often still so employed, they have of late years received an application of far wider importance. Mr. Alfred Nobel, a Swedish engineer, while endeavoring to employ nitro-glycerine for practical purposes, found considerable difficulty in exploding it with certainty; he at length, in 1864, by using a large percussion cap, charged with fulminate of mercury, obtained an explosion of great violence. This result led to the discovery that many explosive substances, when exploded by means of a small quantity of a suitable initiatory explosive, produce an effect far exceeding anything that can be attributed to the ordinary combustion, however rapid, of the body in question; in fact, the whole mass of the explosive is converted into gas with such suddenness that it may, practically, be considered instantaneous. This sudden transformation is termed "detonation." Of the substances capable of producing such action, fulminate of mercury is the most important.

Some explosives appear always to detonate, in whatever manner they may be exploded, such as chloride and iodide of nitrogen; the explosive effect is therefore much greater than that of a slower explosive substance, although their explosive force may be less. Again, other substances, such as gun-cotton and nitro-glycerine, are detonated or not, according to the mode of explosion. Indeed, Abel has proved that most explosives, including gunpowder, can be detonated, provided the proper initiatory charge be employed. Roux and Sarrau have divided explosions into two classes or orders—"detonations" or explosions of the first order, and "simple explosions" of the second order. They made a series of experiments with the object of determining the comparative values of various explosive substances, detonated, and exploded in the ordinary manner; the method employed was to ascertain the quantity of each just sufficient to produce rupture in small spherical shells of equal strength. The following table gives the comparative results for the three most important explosive substances:

	Explosive Effect—	
	Second Order.	First Order.
Gunpowder	1 00	4 34
Gun-cotton or nitro-cellulose	3 00	6 46
Nitro-glycerine	4 80	10 13

These experiments, although valuable, cannot be considered as affording a precise method of comparison; the results would be affected, *inter alia*, by the impossibility of

insuring that the shells were all of the same strength, a point of great importance, considering the very small weights of each explosive used; also, the rate of combustion, and therefore the explosive effect of gunpowder, is materially affected by its mechanical condition, so that different powders would give a varying standard of comparison. However, they afford fair evidence that, when detonated, gun-cotton has about six times, and pure nitro-glycerine about ten times the local explosive effect of gunpowder simply ignited in the ordinary manner; nitro-glycerine is usually employed in the form of "dynamite," mixed with some inert absorbent substance, so that its power is proportionately reduced.

The rationale of detonation is not yet understood. If the transformation were due merely to the mechanical energy of the particles of gas, liberated from the initiatory charge at a tremendous velocity, being converted into heat by impact against the mass of the explosive substance, then it would follow that the powerful explosive would be the best detonating agent. This, however, is not the fact; for a few grains of fulminate of mercury in a metal tube will detonate gun-cotton, whereas nitro-glycerine, although possessed of more explosive force, will not do so unless used in large quantities. The fact of its being possible to detonate wet gun-cotton is also a proof that the action cannot be due to heat alone. It would rather seem to be what prof. Bloxam terms "sympathetic" explosion. The experiments of Abel, as well as those of Champion and Pellet in France, appear to indicate a vibratory action of the detonating agent upon the ultimate particles of the substance to be exploded. An explosive molecule is most unstable, certain very delicately balanced forces preserving the chemical and physical equilibrium of the compound. If these forces be rapidly overthrown in succession, we have explosion; but when, by a blow of a certain kind, they are instantaneously destroyed, the result is detonation. Just as a glass globe may withstand a strong blow, but be shattered by the vibration of a particular note, so it is considered by some authorities that, in the instance cited, the fulminate of mercury communicates a vibration to which the gun-cotton molecule is sensitive, and which overthrows its equilibrium; it is not sensitive to the vibrations caused by the nitro-glycerine, which only tears and scatters it mechanically. Although the action of detonation has been spoken of as instantaneous, and may practically be so considered, yet a certain infinitesimal duration of time is required for the metamorphosis; different substances possess, doubtless, different rates of detonation, for we can scarcely conceive of a mechanical mixture, such as gunpowder, being so sensitive to the action of the detonating impulse as a definite chemical compound, and the rate even varies slightly, for the same explosive, with its physical state. It has been shown by means of capt. A. Nobel's chronoscope, that compressed gun-cotton, when dry, is detonated at a velocity of from 17,000 to 18,000 ft. a second, or about 200 m. a minute; by using a small primer of dry gun-cotton, the same substance in the wet state may be detonated at the increased rate of from 18,000 to 21,000 ft. a second, or about 240 m. a minute.

The following table shows the potential energy, in foot-tons, calculated from the heat of combustion for each explosive, determined by Roux and Sarrau, in the experiments already referred to; that for gunpowder is the mean given by five kinds:

Explosive Substances.	Potential energy per lb. Foot-tons.
Gunpowder	480
Gun-cotton	716
Nitro-glycerine	1139
Picrate of potash	536
Picrate of potash and saltpeter	615
Picrate and chlorate of potash	781
Chloride of nitrogen	216

The above figures naturally direct our attention to the small amount of work stored up in even the most violent explosive substance, compared with the potential energy of 1 lb. of coal, which is about 4,980 foot-tons. Nobel and Abel point out that this great difference is due not alone to the fact that the coal draws its oxygen from the air, but also to the necessity that the explosive should expend a considerable amount of work in converting its condensed magazine of oxygen into gas, before it can combine with the carbon; further, with reference to the economical value of the work done, that the oxygen used by the coal costs nothing, whereas much expense is incurred in condensing the oxygen into the explosive substance.

The practical value of any explosive must depend greatly upon the object to be attained. It is essential to distinguish between explosive force and effect; the more sudden the action the more local will be the effect produced, and hence the very violent explosive substances are useless as propelling agents for heavy guns or small arms, since they would destroy the weapon before overcoming the inertia of the projectile. It is true that gun-cotton, prepared in various forms, and mixed with other substances to moderate its action, as well as a similar compound made from sawdust, an inferior form of cellulose, are sometimes used with small arms; but, in addition to a want of uniformity in action, the strain caused by such substances would be far too great in the large charges needed for heavy guns. Again, there are cases, even in mining or blasting

operations, for instance, when it is desired to displace large masses of earth or soft rock, in which a comparatively slow explosive, such as gunpowder, would give better results than gun-cotton or dynamite. However, speaking generally, gunpowder in some one of its forms is far the most valuable as a propelling agent, while for destructive purposes, the last named substances are much more effective, especially when detonating.

The various explosives in common use are gunpowder in various forms; gun-cotton; nitro-glycerine; dynamite, or giant powder, and dualin. Others less used are Schultze powder, glyoxiline, lithofractor, Brugiere's powder, the chlorates, and the picrates. See GUNPOWDER, *ante;* NITRO-GLYCERINE, *ante.* Dualin was invented soon after dynamite. The patent describes it as consisting of "cellulose, nitro-cellulose, nitro-starch, nitro-mannite, and nitro-glycerine, mixed in different combinations, depending on the degree of strength desired in adapting its use to various purposes." A sample supplied by the inventor for trial at the Hoosac tunnel was found by analysis to consist of 60 per cent of nitro-glycerine and 40 per cent of washed sawdust, not treated with nitric and sulphuric acids. The best variety now manufactured is believed to be cellulose derived from poplar pulp, treated with nitric and sulphuric acids, and saturated with nitro-glycerine.

Having a less specific gravity than dynamite, dualin is inferior to it, bulk for bulk, in explosive energy. When soaked in water, it can be exploded only by a violent detonation, exceeding that of the ordinary fuse, and even then it loses more than half its power. It congeals at about 45° Fahrenheit, and in this state readily explodes, becoming so sensitive to friction as to make it dangerous to use in cold weather. In other respects its properties resemble those of dynamite.

Laws.—There are laws in most of the states regulating the storage and transportation of explosives, and city corporations and boards of underwriters have strict ordinances and rules on the same subjects. [This article is mainly an abridgment from *Encyclopædia Britannica,* ninth edition.]

EXPO'NENT AND **EXPONEN'TIAL.** When it was wanted to express the multiplication of unity for any number of successive times by the same number or quantity, e.g., $1 \times 5 \times 5$, or $1 \times a \times a \times a$, it was found a convenient abbreviation to write 1×5^2 and $1 \times a^3$, or simply 5^2 and a^3; and the numbers, 2 and 3, indicating how often the operation of multiplication is repeated, were called exponents. But the theory of exponents gradually received extensions not originally contemplated, and has now an extensive notation of its own. Thus, $a^0 = 1$, $a^1 = a$, $a^{-2} = \frac{1}{a^2}$, $a^{\frac{1}{2}} = \sqrt{a}$, $a^{\frac{1}{3}} = \sqrt[3]{a}$, $a^{\frac{2}{3}} = \sqrt[3]{a^2}$, or the cube root of the square of a. Also a^x is the xth power of a, x being any number integral or fractional; and, a continuing the same, x may be so chosen that a^x shall be equal to any given number. In this case, x is called the logarithm of the number represented by a^x. Considered by itself, a^x is an exponential. Generally, any quantity representing a power whose exponent is variable, is an exponential, as a^x, x^x, y^x, etc. Exponential equations are those which involve exponentials, such as $a^x = b$, $x^x = c$.

EXPORTS. See IMPORTS and EXPORTS.

EX POST FACTO, in law, an act that operates retrogressively; a law passed after the commission of an act by which such an act may be punished. The constitution of the United States prohibits the passage of such laws, either by congress or by any other legislative body. Chief-Justice Marshall defines an *ex post facto* law to be one which rendered an act punishable in a manner in which it was not punishable when it was committed. Various decisions of the courts make this definition more specific, and hold as *ex post facto* any law which makes criminal an act which, done before its passage, was innocent; any law which makes a crime greater than it was at the time of commission; any law which inflicts punishment greater than was affixed to a crime when committed; any law which changes the rules of evidence as to an offense already committed and to the prejudice of a defendant. The constitutional prohibition of *ex post facto* laws applies to criminal and penal statutes only, and not to those which simply affect property.

EXPOSURE OF **INFANTS.** See INFANTICIDE.

EXPRESS, a business which has grown within the past quarter of a century to enormous importance. It was in the spring of 1839 that William F. Harnden advertised to take charge of money and small parcels to transmit between Boston and New York, and from his single carpet-bag has risen a system of inter-communication between places and persons that, for numbers of stations and length of route, is surpassed only by the post-office department. The all-embracing express reached across the ocean as early as 1855, and now this peculiar American institution extends literally to the ends of the earth. The most valuable articles are sooner intrusted to a responsible express than to government mails, for, in addition to ever-increasing care, there is a system of package insurance which secures the owner in almost any case of loss. The express business is too well known to need any particular description. It is estimated that the American express companies alone cover about 75,000 m. of road; make a travel of 400,000 m. per day; employ over 20,000 men, 4,000 horses, and have from 9,000 to 10,000 offices. A large proportion of the business is the collection of small sums for merchants, the C. O. D. packages implying "collect on delivery" the sum marked on the package as due.

EXPRESSIO NĒ, CON. or EXPRESSIVO, Italian terms in music, meaning with expression; impassioned, with pathos. Where the word appears at the beginning of a composition, the piece must be executed throughout with feeling. "Expressioné" frequently appears above certain passages which alone are to be performed so, while the harmony in the accompaniment goes on quietly.

EXTENSION, in logic, is a word put into contrast with another term, COMPREHENSION, and the two mutually explain each other. A general notion is said to be extensive according to the extent of its application, or the number of objects included under it. Thus, figure is a term of very great extension, because it contains in its compass many varieties, such as round, square, oblong, polygonal, etc. In like manner, European is more extensive than German, man than European, animal than man, organized being than animal. The highest genera are formed by taking in a wider range of objects. Matter and mind are the most extensive classes that we can form. For, although a higher genus is sometimes spoken of, viz., existence; to call this a class is to generalize beyond real knowledge, which does not begin till we have at least two actual things to contrast with each other. What can be contrasted only with non-existence, non-entity, or nothingness, is not genuine knowledge: no property can be affirmed of it apart from the thing itself. Matter, in its contrast to mind, is a real cognition; and *vice versâ*, mind in its contrast to matter. These, then, are the most extensive terms that have any real knowledge attached to them. But this property of E. is gained by dropping more and more of the peculiarities of the included individuals; "organized being," in order to include both plants and animals, must drop from its signification what is peculiar to each, and mean only what is common to both. In short, these very extensive notions have a very *narrow* signification; it is the less extensive that have most meaning. The meaning of "man," or the number of attributes implied in this generic expression, is large. Everything that goes to a human being—the human form and organization, the mental attributes of reason, speech, etc.—is expressed by this term, which is on that account said to be more COMPREHENSIVE than animal or organized being. Thus it may be seen that the greater the E., the less is the comprehension; and the greater the comprehension, the less is the extension. An individual name is the term of greatest comprehension, and of least extension. "Socrates" comprehends all that is common to men and to philosophers, together with all that is peculiar to himself. On the logical uses of this distinction, see sir W. Hamilton's *Lectures on Logic*, i. 140.

EXTENT, in English law, a writ issuing out of the court of exchequer to compel payment of debts to the crown. In order to warrant the issue of this writ, the debt must be a debt of record (q.v.). Extents are in chief or in aid. The former are issued against the crown debtor, and under it the body, land, and goods may all be taken at once. An extent in aid is issued at the suit of a crown debtor against a person indebted to the crown debtor. On this writ, the chattels only of the person against whom it is issued can be attached. Writs of extent in aid were at one time made the means of great abuse; persons who were not crown debtors were in the practice of assigning debts to the crown, and thereupon obtaining a writ in aid. This practice was stopped by 7 James I. c. 15, forbidding assignments to the crown. Persons then resorted to other means, such as taking the debt in name of the crown, or getting themselves appointed bailiffs for the crown, and in that character procuring the issue of the writ. At last, the practice was finally stopped by 57 Geo. III. c. 117, by which it is enacted that the amount of the crown debt shall be indorsed on every extent in aid, and that any overplus beyond the crown debt shall be paid into court to be disposed of as the court shall direct. By the treaty of union, extents were introduced into Scotland on revenue matters; but the sheriff is only entitled to take the debtor's movables.

EXTENT (in Scotland). There were no taxes in feudal times. The king was supported by the rents of his property lands, and by the occasional profits of superiority—ward, non-entry, marriage, escheat, and the like—which were known by the general name of casualties (q.v.). Beyond these, and the expenses which the discharge of his ordinary duties to his superior imposed on him, the vassal was not liable to be taxed. But to this rule there were some exceptions. When it became necessary to redeem the king from captivity, to provide a portion for his eldest daughter, or to defray the expense of making his eldest son a knight, a general contribution was levied. One of these occasions occurred when Alexander III. betrothed his daughter Margaret to Eric, the young king of Norway, and engaged to give her a tocher of 14,000 merks. This sum was far beyond the personal resources of the king, and consequently fell to be levied by a land-tax—land and its fruits being then the only appreciable species of property. But if the tax was to be levied fairly and equally, this could be done only by ascertaining the value of the whole lands in the kingdom, as had been done in England in the time of Edward I. (4 Edw. I. i. anno 1276). Whether this was the first occasion on which a general valuation of all the lands of Scotland had been made, as lord Kames thought (*Law Tracts*, tract xiv.), or whether there had been earlier valuations of the same kind, as others have supposed (Cranston *v.* Gibson, May 16, 1818, Fac. Coll.), is still a subject of dispute amongst antiquaries. It is certain, however,

that the valuation here spoken of was long known as *the old extent*. As such, it is spoken of in the act of indenture of 15th July, 1336, by which the parliament of Scotland agreed to give to king Robert Bruce the tenth penny of all the rents of the laity during his life. In this latter act it was provided that such lands as had been wasted by the war should be revalued by an inquest before the sheriff, and the retour, or formal verdict, was so framed as to contain a statement both of the present value of the lands, and of what they were worth "in the time of peace." In almost all cases, the new was considerably under the old valuation, a fact which shows how widespread must have been the devastation of that terrible war. The same deplorable fact is brought out by the E. taken with a view to raise the sum necessary for the ransom of David II. On this occasion, the new E. of the temporal lands scarcely amounted to £25,000, whereas the old E. exceeded £50,000 (Cranston *v.* Gibson, *ut sup.*). But this state of matters was reversed when James I. succeeded in restoring peace and prosperity. Indeed, even before the influence of his personal qualities could have been felt, the condition of the country must have improved, because the E. which was taken in 1424, for the purpose of redeeming him from captivity, shows in general an advance upon that even of the time of Alexander III. In several later cases (1481, 1488, 1535), in which grants were made to the crown, the assessments were levied from temporal lands by a series of new extents, according to present value. During the minority of Mary, the assessments, which were heavy and numerous, were levied according to an old E., but it is doubtful whether it was the E. of Alexander III., or of David II., or a later one than either. The extents of which we have spoken did not apply to church lands. The share of the subsidies applicable to them was levied according to the value of the benefices as settled by "Bagimont's Roll," which was made up in the time of Alexander III. by Benemundus de Vicci, vulgarly called Bagimont. Cromwell introduced a more equitable rule of assessment, and fixed precisely the ratio to be laid upon each county; and his system was adhered to, with little variation, after the restoration (act of convention, 23d January, 1667). The rent fixed by these valuations, commonly called the valued rent, was that according to which the land-tax and most of the other public and parochial asssessments were imposed till the passing of the recent valuation acts, 17 and 18 Vict. c. 91, 1854, and 20 and 21 Vict. c. 58, 1857. See VALUATIONS OF LAND.

EXTRACTION OF ROOTS. See EVOLUTION. The roots which have in practice to be most frequently extracted are the *square* and *cube* roots. It is proposed to explain the rule for their extraction as it is given in books of arithmetic. And first of the square root. The square of $a + b$ is $a^2 + 2ab + b^2$, and we may obtain the rule by observing how $a + b$ may be deduced from it. Arranging the expression according to powers of some letter a, we observe that the square root of the first term is a.

$$\begin{array}{rll} & a^2 + 2ab + b^2 (a + b \\ & a^2 & \\ \hline 2a + b) & 2ab + b^2 & \\ & 2ab + b^2 & \\ \hline \end{array}$$

Subtract its square from the expression, and the remainder is $2ab + b^2$. Divide $2ab$ by $2a$, and the result is b, the other term in the root. Multiply $2a + b$ by b, and subtract the product from the remainder. If the operation does not terminate, it shows that there is another term in the root. In this case, we may consider the two terms $a + b$ already found as one, and as corresponding to the term a in the preceding operation; and the square of this quantity having been by the preceding process subtracted from the given expression, we may divide the remainder by $2(a + b)$ for the next term in the root, and for a new subtrahend multiply $2(a + b) +$ the new term, by the new term; and the process may be repeated till there is no remainder. The rule for extracting the square root of a number is an adaptation of this algebraical rule. In fact, if the number be expressed in terms of the radix of its scale, it is seen to be a concealed algebraical expression of the order we have been considering. Thus, $N = ar^n + br^{n-1} + \ldots + q$. The number 576 in the denary scale may be written $5 \times 10^2 + 7 \times 10 + 6$; and treating it as an algebraical expression, we should find its root to be $2 \times 10 + 4$, or 24. The only part of the arithmetical rule now requiring explanation is the rule of pointing. As every number of one figure is less than 10, its square must be less than 10^2; generally, every number of n figures is less than 10^n (which is 1 followed by n ciphers); but also every number of n figures is not less than 10^{n-1}, and therefore its square is not less than 10^{2n-2}—which is the smallest number of $2n - 1$ figures. Also, 10^{2n} is the smallest number of $2n + 1$ figures. It follows that the square of a number of n figures has either $2n$ or $2n - 1$ figures. If, then, we put a point over the units place of a number of which the root is to be extracted, and point every second figure from right to left, the number of points will always equal that of the figures in the root. If the number of figures be even, the number will be divided into groups of two each; if odd, the last group will contain only a single figure.

The rule for the extraction of the cube root of a number is deduced from that for

the extraction of the cube root of an algebraical expression in the same way as in the case of the square root. The cube of $(a + b)$ is

$$a^3 + 3a^2b + 3ab^2 + b^3 (a + b$$

$$a^3$$

$$3a^2) \quad 3a^2b + 3ab^2 + b^3$$
$$3a^2b + 3ab^2 + b^3$$

Hence the rule in algebra. Arrange the expression according to descending powers of a, the cube root of the first term a^3 is a, the first term of the root. Subtract its cube from the expression, and bring down the remainder. Divide the first term by $3a^2$, and the quotient is b, the second term of the root. Subtract the quantity $3a^2b + 3ab^2 + b^3$. If there is no remainder, the root is extracted. If there is, proceed as before, regarding $a + b$ as one term, corresponding to a in the first operation. Let, for example, $a + b = a^1$, then $3a^{1\,2}$ is the new trial divisor. If c be the new term or third figure of the root, then the quantity to be subtracted to get the next remainder is $3a^{1\,2}c + 3a^1c^2 + c^3$, and so on till there is no remainder. The rule of pointing in the extraction of the cube root may be proved, as in the case of the square root, by showing that the cube of a number of n figures contains $3n$, $3n - 1$, or $3n - 2$ figures; and, therefore, if we put a point over the units place, and on each third figure, we shall have as many periods as there are figures in the root.

It may be observed that a rule for the extraction of any root of a number may be got from considering how, from the expansion of $a + b$ to the nth power, or $a^n + na^{n-1}b +$, etc., the root $a + b$ is to be obtained. See EVOLUTION and INVOLUTION.

EXTRACTIVE MATTER is the term applied to certain organic matters resembling humine, found in soils during the decay of vegetable matter, and which are precipitated during the concentration of water solutions.

EXTRACT OF MEAT is obtained by acting upon chopped meat by cold water, and gradually heating, when about one-eighth of the weight of the meat dissolves out, leaving an almost tasteless insoluble fibrine. The extract of meat contains the savory constituents of the meat, and is a light nutritious article of food. See BEEF-TEA and BROTH. It may be concentrated into small bulk, and when desired, may be afterwards treated with water, and being heated, forms an agreeable, light, and nutritive soup. See PRESERVES.

EXTRACTS, in a technical sense, are medicinal preparations of vegetable principles, got either by putting the plants in a solvent or menstruum, and then evaporating the liquid down to about the consistency of honey, or by expressing the juice of the plants and evaporating; this last is properly *inspissated juice*. E., therefore, contain only those vegetable principles that are either held in solution in the juices of the plants themselves, or are soluble in the liquid employed in extracting them, and at the same time are not so volatile as to be lost during evaporation. Now, as many extractive matters are more or less volatile, it makes a great difference whether the operation is conducted at a low or at a high temperature. E. are called *watery* or *alcoholic* according as the menstruum employed is water or spirits. Ether is also used in extracting. Different plants of course afford different E., some being of the nature of bitters, others being used as pigments, tannin, etc. E. are liable to great uncertainty in point of strength and composition, and require to be prepared with great care. Evaporation in vacuo is found to be a great improvement.

EXTRADI'TION, the giving up, by authority of law, a person accused of a crime, to the foreign jurisdiction within which it was committed, in order that he may be tried there. E. is always the subject of international treaty. A treaty or convention for this purpose was entered into between this country and France in 1843, and between this country and the United States of America in 1842. Nearly all other states have done likewise. The crimes for which E. is allowed were settled by the E. act 1870, 33 and 34 Vict. c. 52, and include murder, manslaughter, coining, forgery, larceny, false pretenses, bankruptcy offenses, rape, abduction, child-stealing, burglary, arson, robbery, threats to extort money, sinking of ships, revolt and assaults in ships; but there is no surrender if the offense is one of a political character. The surrender is effected through the intervention of the secretary of state, and it is by the secretary's warrant that he is finally handed over with the depositions to the foreign state making the requisition.

EXTRADI'TION (*ante*), in the United States. The federal constitution provides that "a person charged in any state with treason, felony, or other crime, who shall flee from justice and be found in another state, shall, on demand of the executive authority of the state from which he fled, be delivered up to be removed to the state having jurisdiction of the crime." As to foreign countries, E. is regulated by special treaties, and the United States has such treaties with Great Britain, France, the Hawaian islands, most of the states now forming the German empire, and with that empire, Austria, Sweden and Norway, Italy, Switzerland, Venezuela, the Dominican republic, Nicaragua, Hayti, and Mexico. These treaties provide for E. in cases of the higher crimes,

such as murder, assault with intent to kill, piracy, arson, robbery, forgery, rape, embezzlement by public officers, burglary, etc. Proceedings in cases of E. are carefully defined and guarded by law. Political offenders, even though making war upon their own government, are not subject to extradition. There are some treaties made between the United States and several Indian tribes, recognized as nations or distinct communities, in some of which the Indians have stipulated to surrender to the federal authorities persons accused of crimes against the laws of the United States.

EXTRAVAGAN'TES CONSTITUTIO'NES, papal constitutions of John XXII. and some of his successors, supplemental to the "Corpus Juris Canonica." They got their name from the fact that they were not arranged in order with the other constitutions, but were "outside wanderers" from the general code.

EXTRAVASA'TION is the escape of any of the fluids of the living body from their proper vessels (*vas*) through a rupture or injury in their walls. Excrementitious matter thus sometimes escapes into the abdomen through a wound or ulceration of the bowels. But the term is oftenest used in speaking of the escape of blood from injured blood-vessels. E. is distinguished from exudation by this, that in the last the vessels remain entire, and the effusion takes place by filtration through their walls; nor does more than a part of the blood so escape, the blood gobules being retained, while in E. perfect blood is effused. Many kinds of E. are immediately fatal, such as that of urine or of gall into the abdomen, or of blood from the vessels of the brain in many cases of apoplexy. The dark color resulting from a bruise is owing to extravasated blood from ruptured capillary vessels.

EXTREME UNCTION, a sacrament of the Roman Catholic church, which, as the other sacraments supply spiritual aid in the various circumstances of life, is believed to impart to the Christian in death grace and strength to encounter the struggle, as well spiritual as bodily, of the dying hour. The right of unction in different forms is common to several of the sacraments; the name "extreme" is given to that of the present sacrament, because it is reserved for the last act of the Christian career. The council of Trent declares this sacrament, although "promulgated" in the well-known passage of St. James v. 14, 15 (which Protestants regard as having more to do with the general belief in the sanative properties of oil), to have been "instituted" by Christ. The fathers frequently allude to the right of unction, and although many of these allusions certainly refer to the unctions of baptism and confirmation, yet Catholics rely on several passages of Origen, Chrysostom, Cæsarius of Arles, and pope Innocent I., as decisive regarding the unction of the dying, as also upon the fact that in the various separated churches of oriental Christians—Greek, Coptic, Armenian, and Nestorian—the rite is found, although with many ceremonial variations. In the Roman Catholic church, the sacrament is administered by the priest, who, "dipping his thumb in the holy oil, anoints the sick person, in the form of the cross, upon the eyes, ears, nose, mouth, hands, and feet; at each anointing making use of this form of prayer: 'Through this holy unction, and his most tender mercy, may the Lord pardon thee whatever sins thou hast committed by thy sight. Amen." And so of the hearing and the rest, adapting the form to the several senses."—Challoner's *Catholic Christian Instructed.* E. U. is reputed by Catholics one of the sacraments "of the living;" that is, it ordinarily requires that the recipient should have previously obtained remission of his sins by absolution or by perfect contrition; but it is held to remit, *indirectly*, actual sins not previously remitted, and also (although not infallibly, but according to the merciful designs of Providence) to alleviate, and even to dispel, the pains of bodily disease. The holy oil which forms the "matter" of this sacrament must be blessed by the bishop—a ceremony which is performed with great solemnity once each year by the bishop, attended by a number of priests, on Maundy-Thursday. The oil so blessed is reserved for use during the year. In the Greek church, the sacrament is administered by several priests conjointly. In its most solemn form, seven priests unite in its administration; in ordinary circumstances, it is conferred by two. The Greek form of words also differs, although not substantially, from that of the Latin church. The Greeks call this sacrament "the holy oil," and sometimes "the oil of prayer."

EXTREMITY. See SKELETON.

EXUMAS, comprising Great Exuma, Little Exuma, and the Exuma Keys, form part of the group of the Bahama islands. They contain about 2,000 inhabitants, who are employed partly in agriculture, including at one time the growing of cotton, but chiefly in salt-making. In the last-named business, the E. rank second among all the subdivisions of the group. They have exported as much as 116,000 bushels of salt a year. Next to Nassau in New Providence, Little Exuma is the most considerable port of entry in the Bahamas.

EXU'VIÆ, a term applied to organic remains, now seldom employed, but frequently used by the older geologists.

EYALET, or VILAYET, is the largest and most important of the administrative divisions of the Turkish empire, formerly known as pashalics. These are again divided into *livas* or *sanjaks*, the livas into *cazas* or districts, and the cazas into *nahiés* or communes, containing villages or hamlets. Each E. or general government, as it may be

called, is administered by a pasha, who is governor, and the general name for whom is *vali* or viceroy. The governors of the eyalets belong to the dignities of the sword, and are pashas of two tails; and when they are raised to the rank of vizier, as is frequently the case, they become pashas of three tails.

EYCK, HUBERT and JAN VAN, two illustrious painters of the old Flemish school. Much discussion has arisen as to the time of the birth of these brothers, and the various dates assigned range from 1350 to 1400. Some maintain that Hubert was born in 1366, and Jan in 1370; while Kugler—in general a good authority on ancient art—states the dates to be 1366 and 1400, making Hubert 34 years older than Jan. Their birthplace was Maas-Eyck, and they chiefly resided at Bruges and Ghent, and became the founders of the Flemish school of painting. The honor of being the inventors of oil-painting is claimed for them, though sufficient evidence has been adduced to show that it was practiced previously. Before their time, the custom, however, particularly in Italy, was to paint with gums or other substances of an adhesive nature dissolved in water; and if not the inventors, they were at least the first who brought into notice and perfected the mode of mixing colors with oil or some medium of which oil was the chief ingredient; while, for transparent and brilliant coloring and minute finish, their works have never been surpassed. Till the death of Hubert, the brothers generally painted in conjunction: one of their most important works was an altar-piece with folding-doors, representing the Elders adoring the Lamb—a subject taken from the Apocalypse—painted for *Jodocus Vyts*, who presented it to the cathedral of St. Bavon, in Ghent. The two central divisions of this picture are all that now remain in the church at Ghent. Some of the wings are in the gallery at Berlin. The masterpieces of the brothers are for the most part in the cities of Ghent, Bruges, Antwerp, Berlin, Munich, and Paris. In the national gallery, London, there are three pictures of Jan van E., which, though small, well exemplify the high qualities of his works. These are portraits of a Flemish merchant and his wife, standing in the middle of an apartment, with their hands joined—signed and dated 1434: of the portrait of a man in a cloak and fur collar, with a red handkerchief twisted round the head as a turban—painted, according to an inscription on the lower part of the frame, Oct. 21, 1433: and portrait of a man with a dark-red dress, with a green head-covering—signed and dated 10th Oct., 1432. Hubert died in 1426, and Jan in 1441. Compare Waagen, *Ueber Hub. und Jan van Eyck* (Breslau, 1822).

EYCK, HUBERT VAN (*ante*), 1366–1426; the eldest of a remarkable Flemish family of painters. He gained his artistic reputation in Flanders. He was in the pay of Philip of Charolais until 1421. His masterpiece is "The Worship of the Lamb," the noblest creation of the Flemish school. This great composition is one of the chief illustrations of the solemn grandeur of art in the church of the 15th c.; correct in drawing, glowing in color, deeply earnest and simple, and instinct with religious sentiment.

EYCK, JAN VAN (*ante*), 1390-1440; brother of Hubert, and also a painter. He was, for nearly all his life under the patronage of Philip of Burgundy. He produced a great number of portraits and compositions, often working with his brother. Most of Jan's productions were of a high order of merit, lacking the modern scientific perspective and his brother's stern religious feeling, but with brilliance of color, fine gradation of tone minuteness of finish, and firmness of touch.

EYE, a parliamentary and municipal borough in Suffolk, 20 m. n. of Ipswich. Its streets are rather narrow and irregular. Pop. (1871) of municipal borough, 2,396; of parliamentary borough, 6,721. It sends 1 member to parliament, the parliamentary borough including 11 parishes. Eye, in Anglo-Saxon, means island; the river surrounding the town. Breweries, an iron-foundry, and a large flax manufactory furnish employment.

EYE, ANATOMY AND PHYSIOLOGY OF THE. In this article we shall consider: 1 The structure of the human eyeball, and of certain accessory parts or appendages which serve to protect that organ, and are essential to the due performance of its functions. 2. The most striking modifications which this organ presents in some of the lower animals. 3. The special uses of the various parts of the eye considered as an optical instrument; and 4. The action of the retina.

1. The *globe of the eye* is placed in the anterior part of the cavity of the orbit (q.v.), in which it is held in position by its connection with the optic nerve posteriorly, and with the muscles which surround it, and by the eyelids in front. It is further supported behind and on the sides by a quantity of loose fat, which fills up all the interstices of the orbit, and facilitates the various movements of which the eye is capable.

The form of the eyeball is nearly spherical; but on viewing the organ in profile, we see that it is composed of segments of two spheres of different diameters. Of these, the anterior, formed by the transparent cornea, has the smaller diameter, and is therefore the most prominent; and hence the antero-posterior slightly exceeds (by about a line) the transverse diameter. The radius of the posterior or sclerotic segment is about $\frac{13}{10}$ths, and that of the anterior segment about $\frac{8}{10}$ths of an inch.

When the eyes are in a state of repose, their antero-posterior axes are parallel; the optic nerves, on the other hand, diverge considerably from their commissure within the cavity of the skull to the point where they enter the globe; consequently, their direction

does not coincide with that of the eye. Each nerve enters the back of the globe at a distance of about $\frac{1}{3}$th of an in. on the inner side of the antero-posterior axis of the eye.

The eyeball is composed of several investing membranes, and of certain transparent structures, which are inclosed within them, and which, together with the cornea (one of the membranes), act as refractive media of various densities upon the rays of light which enter the eye.

The outermost coat of the eye is the *sclerotic* (from *skleros*, hard). It is a strong, dense, white, fibrous structure, covering about four fifths of the eyeball, and leaving a circular deficiency anteriorly, which is occupied by the cornea. Posteriorly, it is perforated by the optic nerve, and it is there continuous with the sheath which that nerve derives from the dura mater, the fibrous investment of the brain and spinal cord. Near the entrance of the nerve, its thickness is about $\frac{1}{20}$th of an in.; from this it diminishes to about $\frac{1}{40}$th; but in front it again becomes thicker, from the tendinous insertions of the straight muscles which blend with it. This coat, by its great strength and comparatively unyielding structure, maintains the inclosed parts in their proper form, and serves to protect them from external injuries.

The *cornea* (so called from its horny appearance) is a transparent structure, filling up the aperture left in the anterior part of the sclerotic. Its circumference is overlaid by the free edge of the sclerotic, which in some parts presents a groove, so as to retain it more firmly; and the connection by continuity of texture between the two structures is so close, that they cannot be separated in the dead body without considerable maceration.

The cornea, in consequence of its greater convexity, projects beyond the line of the sclerotic; the degree of convexity, however, varies in different persons, and at different periods of life. It is thicker than any part of the sclerotic, and so strong as to be able to resist a force capable of rupturing that tunic.

Although beautifully transparent, and appearing to be homogeneous, it is in reality composed of five layers, clearly distinguishable from one another—viz. (proceeding from the front backwards) 1. The conjunctival layer of epithelium. It is in this epithelium that particles of iron, stone, etc., forcibly driven against the eye, usually lodge, and it is a highly sensitive membrane. 2. The anterior elastic lamina forming the anterior boundary of the cornea proper; it is not more than $\frac{1}{2000}$th of an inch in thickness; and its function seems to be that of maintaining the exact curvature of the front of the cornea. 3. The cornea proper, on which the thickness and strength of the cornea mainly depend. 4. The posterior elastic lamina, which is an extremely thin membrane, in which no structure can be detected. It probably contributes, like the anterior lamina, to the exact maintenance of the curvature of the cornea, so necessary for correct vision. 5. The posterior epithelium of the aqueous humor, which is probably concerned in the secretion of that fluid.

For further details regarding these different layers, we must refer to Todd and Bowman's *Physiological Anatomy*, vol. ii. pp. 17-21.

The *choroid coat* is a dark-colored vascular membrane, which is brought into view on the removal of the sclerotic. Its outer surface, which is nearly black, is loosely connected with the sclerotic by connective tissue, in which are contained certain nerves and vessels—termed the ciliary nerves and vessels—which go to the iris. Its inner surface is soft, villous, and dark-colored. In front, it is attached to the membrane of the vitreous humor by means of the ciliary processes, which consist of about sixty or seventy radiating folds. These are alternately long and short, and each of them is terminated by a small free interior extremity; and they are lodged in corresponding folds in the membrane of the vitreous humor. In other parts, it is loosely connected with the retina. The choroid is composed of minute ramifications of vessels—especially of veins, which, from their whirl-like arrangement, are termed *vasa vorticoso*—of connective tissue, and of pigment cells, which usually approximate to the hexagonal form, and are about $\frac{1}{1000}$th of an inch in diameter. In albinos, this pigment is absent, and hence their eyes have a pink appearance, which is due to the unconcealed blood in the capillaries of the choroid and iris.

The *iris* may be regarded as a process of the choroid, with which it is continuous, although there are differences of structure in the two membranes. It is a thin flat membranous curtain, hanging vertically in the aqueous humor in front of the lens, and perforated by the pupil for the transmission of light. It divides the space between the cornea and the lens into an anterior (the larger) and a posterior (the smaller) chamber, these two chambers freely communicating through the pupil. The outer and larger border is attached all round to the line of junction of the sclerotic and cornea, while the inner edge forms the boundary of the pupil, which is nearly circular, lies a little to the inner side of the center of the iris, and varies in size according to the action of the muscular fibers of the iris, so as to admit more or less light into the interior of the eyeball; its diameter varying, under these circumstances, from about $\frac{1}{3}$d to $\frac{1}{10}$th of an inch. It is muscular in its structure, one set of fibers being arranged circularly round the pupil, and, when necessary, effecting its contraction, while another set lie in a radiating direction from within outwards, and by their action dilate the pupil. These fibers are of the unstriped or involuntary variety. The nerves which are concerned in these movements will be presently noticed.

The varieties of color in the eyes of different individuals, and of different kinds of animals, mainly depend upon the color of the pigment which is deposited in cells in the substance of the iris.

Within the choroid is the *retina*, which, although continuous with the optic nerve—of which it is usually regarded as a cuplike expansion—differs very materially from it in structure. Before noticing the elaborate composition of this part of the eye, which has only been revealed by recent microscopical investigation, we shall briefly mention those points regarding it which can be established by ordinary examination. It is a delicate semi-transparent sheet of nervous matter, lying immediately behind the vitreous humor, and extending from the optic nerve nearly as far as the lens. On examining the concave inner surface of the retina at the back of the eye, we observe, directly in a line with the axis of the globe, a circular yellow spot (*limbus luteus*), of about $\frac{1}{20}$th of an inch in diameter, called, after its discoverer, *the yellow spot of Sömmering*. As there has been much discussion regarding the structure and function of this spot, we may observe that Dr. Todd and Mr. Bowman, two of our most eminent English microscopists, after several examinations, regard it as a small mound or projection of the retina towards the vitreous humor, with a minute aperture in the summit. The only mammals in which it exists are man and the monkey. Its use is unknown, but vision is remarkably perfect at this spot—a circumstance which, however, may possibly be accounted for by the fact, that it is singularly free from blood-vessels, which curve round it, and apparently avoid it.

The structure of the retina, as revealed by the microscope, is in the highest degree remarkable. Although its greatest thickness (at the entrance of the optic nerve) is only about $\frac{1}{120}$th of an inch, and as it extends anteriorly, it soon diminishes to $\frac{1}{250}$ of an inch, the following layers from without inwards may be distinguished in all parts of it: 1. The layer of rods and cones, frequently termed, from its discoverer, the *membrane of Jacob;* 2. The granular layer; 3. The layer of gray nerve substance; 4. The expansion of the optic nerve; and, 5. The limitary membrane. Details regarding the nature of these various layers are given in Kölliker's *Manual of Human Histology*, and in Todd and Bowman, *op. cit.*

It now remains for us to describe the *transparent media* which occupy the interior of the globe, and through which the rays of light must pass before they can reach the retina, and form on it the images of external objects. We shall consider them in the order in which the rays of light strike them.

Immediately behind the transparent cornea is the *aqueous humor* which fills up the anterior and posterior chambers which lie between the cornea and the lens. As its name implies, it is very nearly pure water, with a mere trace of albumen and chloride of sodium. As no epithelium exists in front of the iris, or on the anterior surface of the lens, it is most probably secreted by the cells on the posterior surface of the cornea.

The *crystalline lens* lies opposite to and behind the pupil, almost close to the iris, and its posterior surface is received into a corresponding depression on the forepart of the vitreous humor. In form, it is a double-convex lens, with surfaces of unequal curvature, the posterior being the most convex. It is inclosed in a transparent capsule, of which the part covering the anterior surface is nearly four times thicker than that at the posterior aspect, in consequence, doubtless, of greater strength being required in front, where there is no support, than behind, where the lens is adherent to the vitreous membrane. The microscopic examination of the substance or body of the lens reveals a structure of wonderful beauty. Its whole mass is composed of extremely minute elongated ribbon-like structures, commonly called the *fibers of the lens*, which are regarded by Kölliker as *thin-walled tubes*, with clear, albuminous contents. These fibers are arranged side by side in lamellæ, of which many hundred exist in every lens, and which are so placed as to give to the anterior and posterior surfaces the appearance of a central star, with meridian lines.

The lens gradually increases in density, and, at the same time, in refracting power, towards the center; by this means the convergence of the central rays is increased, and they are brought to the same focus as the rays passing through the more circumferential portions of the lens. (According to Brewster, the refracting power at the surface is 1.3767, and at the center 1.3990.)

According to Berzelius, the lens contains 58 per cent of water, 36 of albumen, with minute quantities of salts, membrane, etc. In consequence of the albumen, it becomes hard and opaque on boiling, as we familiarly see in the case of the eyes of boiled fish. In the adult, its long diameter ranges from $\frac{1}{4}$d to $\frac{2}{3}$ths, and its antero-posterior diameter from $\frac{1}{3}$th to $\frac{1}{4}$th of an inch; and it weighs 3 or 4 grains.

The *vitreous humor* lies in the concavity of the retina, and occupies about four fifths of the eye posteriorly. It is inclosed in the hyaloid membrane, which sends numerous processes inwards, so as to divide the cavity into a series of compartments, and thus to equalize the pressure exerted by the inclosed soft gelatinous mass. Between the anterior border of the retina and the border of the lens, we have a series of radiating folds or plaitings termed the *ciliary processes of the vitreous body*, into which the *ciliary processes of the choroid* dovetail. The vitreous humor contains, according to Berzelius, 98.4 per cent of water, with a trace of albumen and salts, and hence, as might be expected, its refractive index is almost identical with that of water.

The appendages of the eye now claim our notice. The most important of these appendages are the *muscles within the orbit*, the *eyelids*, the *lachrymal apparatus*, and the *conjunctiva*, to which (although less important) we may add the *eyebrows*.

The *muscles* by which the eye is moved are four straight (or *recti*) muscles, and two oblique (the superior and inferior). The former arise from the margin of the optic foramen at the apex of the orbit, and are inserted into the sclerotic near the cornea, above, below, and on either side. The superior oblique arises with the straight muscles; but, after running to the upper edge of the orbit, has its direction changed by a pulley, and proceeds backwards, outwards, and downwards. The inferior oblique arises from the lower part of the orbit, and passes backwards, outwards, and upwards. The action of the straight muscles is sufficiently obvious from their direction: when acting collectively, they fix and retract the eye; and when acting singly, they turn it towards their respective sides. The oblique muscles antagonize the recti, and draw the eye forwards; the superior, acting above, directs the front of the eye downwards and outwards, and the inferior upwards and inwards. By the duly associated action of these muscles, the eye is enabled to move (within definite limits) in every direction.

The *eyelids* are two thin movable folds placed in front of the eye, to shield it from too strong light, and to protect its anterior surface. They are composed of (1) skin; (2) of a thin plate of fibro-cartilage, termed the tarsal cartilage, the inner surface of which is grooved by thirty or forty parallel vertical lines, in which the Meibomian glands are imbedded; and (3) of a layer of mucous membrane, continuous, as we shall presently see, with that which lines the nostrils, and which joins the skin at the margin of the lids, in which the eyelashes (*cilia*) are arranged in two or more rows. The upper lid is much the larger; and to the posterior border of its cartilage a special muscle is attached, termed the *levator palpebræ superioris*, whose object is to elevate the lid, and thus open the eye; while there is another muscle, the *orbicularis palpebrarum*, which surrounds the orbit and eyelids, and by its contraction closes the eye. The Meibomian glands secrete a sebaceous matter, which facilitates the free motion of the lids, and prevents their adhesion. The eyelashes intercept the entrance of foreign particles directed against the eye, and assist in shading that organ from an excess of light.

The *lachrymal apparatus* consists of the lachrymal gland, by which the tears are secreted; two canals, into which the tears are received near the inner angle of the eye; the sac, into which these canals open; and the duct, through which the tears pass from the sac into the nose. The gland is an oblong body, about the size of a small almond, lying in a depression in the upper and outer part of the orbit. The fluid secreted by it reaches the surface of the eye by seven or eight ducts, which open on the conjunctiva at its upper and outer part. The constant motion of the upper eyelid induces a continuous gentle current of tears over the surface, which carry away any foreign particle that may have been deposited on it. The fluid then passes through two small openings, termed the *puncta lacrymalia*, into the canals; whence its further course into the lower portion of the nose is sufficiently obvious. The conjunctiva (or mucous coat) which covers the front of the eyeball, and lines the inner surface of the lids, passes down and lines the canals, sac, and duct; and is thus seen to be continuous with the nasal mucous membrane, of which it may be regarded as an offshoot or digital prolongation. See Mucous Membranes.

We shall conclude this sketch of the anatomy of the human eye by a brief notice of the *nerves* going to this organ and its appendages.

Into each orbit there enters a nerve of *special sense*—viz., the optic nerve, a nerve of *ordinary sensation*—viz., the ophthalmic branch of the fifth nerve, and certain nerves of *motion* going to the muscular tissues, and regulating the movements of the various parts—viz., the third, fourth, and sixth nerves.

As the optic tracts from which the *optic nerves* originate are noticed in the article Brain, we shall merely trace these nerves from their *chiasma* or commissure forwards. This commissure results from the junction of the optic tracts of the two sides; and it is especially remarkable for the fact that it presents a partial decussation of the nervous fibers; the central fibers of each tract passing into the nerve of the *opposite* side, and crossing the corresponding fibers of the other tract, while the outermost fibers, which are much fewer in number than the central ones, pass to the optic nerve of the *same* side. In front of the commissure, the nerves enter the optic foramen at the apex of the orbit, receive a sheath or investment from the *dura mater*, acquire increased firmness, and finally terminate in the retina.

The peculiar mode of termination of the optic nerves in the cup-like expansion of the retina, the impairment or loss of vision which follows any morbid affection of them, and the constant relation in size which is observed in comparative anatomy between them and the organs of vision, afford sufficient evidence that they are the proper conductors of visual impressions to the sensorium.

The first or ophthalmic division of the fifth or trifacial nerve sends branches to the skin of the eyelids and to the conjunctiva. That it is the nerve of ordinary sensation of the eye, is sufficiently obvious from the following facts: (1) That in disease of this nerve in the human subject, it is not uncommon to find the eyeball totally insensible to every kind of stimulus (particles of dust, pungent vapors, etc.); and (2) That if the

nerve be divided in the cranium (in one of the lower animals), similar insensibility results.

The most important of the nerves of motion of the eye is the third nerve, or *motor oculi*. It supplies with motor power the elevator of the upper eyelid, and all the muscles of the globe, except the superior oblique and the external straight muscle, and, in addition to this, it sends filaments to the iris and other muscular fibers within the eye. The application of an irritant (in vivisection experiments) to its trunk induces convulsive contraction of the principal muscles of the ball and of the iris; while division of the trunk occasions an external squint, with palsy of the upper eyelid and fixed dilatation of the pupil. The squint is caused by the action of the external straight and the superior oblique muscles, while the other muscles are paralyzed by the operation. The normal motor action of the nerve upon the iris, in causing contraction of the pupil, is excited through the optic nerve, and affords a good illustration of *reflex action* (q.v.); the stimulus of light falling upon the retina, and, through it, exciting that portion of the brain from which the third nerve takes its origin. This nerve clearly exerts a double influence in relation to vision: (1) it mainly controls the movements of the eye-ball and the upper eyelid; and (2) from its connection with the muscular structures in the interior, it regulates the amount of light that can enter the pupil, and probably takes part in the adjusting power of the eye to various distances.

The fourth nerve supplies the superior oblique muscle with motor power, while the sixth nerve similarly regulates the movements of the external straight muscle—the only two muscles in the orbit which are not supplied by the third pair.

Although not entitled to be termed a nerve of the orbit, the facial nerve deserves mention as sending a motor branch to the *orbicularis* muscle, by which the eye is closed.

2. *Comparative Anatomy of the Eye.*—In *mammals*, the structure of the eye is usually almost identical with that of man. The organ is, however, occasionally modified, so as to meet the peculiar wants of the animal. Thus, in the cetacea, and in the amphibious carnivora that catch their prey in the water, the shape of the lens is nearly spherical, as in fishes, and there is a similar thickening of the posterior part of the sclerotic, so as to thrust the retina sufficiently forward to receive the image formed by such a lens. (See the subsequent remarks on the eyes of fishes.) Again, instead of the dark-brown or black pigment which lines the human choroid, a pigment of a brilliant metallic lustre is secreted in many of the carnivora, forming the so-called *tapetum lucidum* at the bottom of the eyeball, which seems (according to Bowman) to act as a concave reflector, causing the rays of light to traverse the retina a second time, and thus probably increasing the visual power, particularly where only a feeble light is admitted to the eye. The pupil, moreover, varies in form, being transversely oblong in the ruminants and many other herbivora, and vertically oblong in the smaller genera of cats. These shapes are apparently connected with the positions in which the different animals look for their food. Lastly, in some mammals (for example, the horse), there is a rudimentary third eyelid, corresponding to the *membrana nictitans* of birds.

In *birds*, the eye, though presenting the same general composition as in man, differs from the mammalian eye in several important points. From our knowledge of the habits of birds (especially birds of prey), we should naturally expect that from their rapid movements they should be able readily to alter the focus between the extremes of long and short sighted vision, and the modifications we shall now proceed to notice clearly have this object in view.

By examining a longitudinal section of the eye of the owl, we see (1) that the shape of the organ is not spherical, as in mammals, nor flattened anteriorly, as in fishes and aquatic reptiles, but that the cornea is very prominent, and the antero-posterior diameter lengthened; the consequence of this arrangement being to allow room for a large quantity of aqueous humor, and to increase the distance between the lens and the posterior part of the retina, and thus to produce a greater convergence of the rays of light, by which the animal is enabled to discern near objects, and to see with a faint light. In order to retain this elongated form, we find a series of bony plates, forming a broad zone, extending backwards from the margin of the cornea, and lying embedded in the sclerotic. The edges of the pieces forming this bony zone overlap each other, and are slightly movable, and hence, when they are compressed by the action of the muscles of the ball, there is protrusion of the aqueous humor and of the cornea, adapting the eye for near vision; while relaxation of the muscles induces a corresponding recession of the humor and flattening of the cornea, and fits the eye for distant vision. The focal distance is further regulated by a highly vascular organ called the *marsupium*, or *pecten*, which is lodged in the posterior part of the vitreous humor. It is attached to the optic nerve at the point where it expands into the retina, and seems to be endowed with a power of dilatation and contraction; as it enlarges, from distension of its blood-vessels, it causes the vitreous humor to push the lens forwards, while, as it collapses, the lens falls backwards again towards the retina.

In addition to an upper and lower eyelid, birds have an elastic fold of conjunctiva, which, in a state of repose, lies in the inner angle of the eye, but is movable by two distinct muscles, which draw it over the cornea. It is termed the *membrana nictitans;* it is to a certain degree transparent, for (according to Cuvier) birds sometimes look through it, as, for example, the eagle when looking at the sun. The lachrymal gland

is situated as in mammals, but there is here a second gland, the *glandula Harderi*, which yields a lubricating secretion.

There are no very special peculiarities in the eyes of *reptiles*, and we therefore proceed to notice the most remarkable points presented by the eye in *fishes*. From the comparatively great density of the medium (water) through which the rays of light pass before they impinge upon the transparent structure of the eye of the fish, it is obvious that this organ must act as a very powerful refractive apparatus. The main peculiarity in the eye of the fish is the size, extreme density, and spherical shape of the lens, which give it such an extraordinary magnifying power that it has been employed as a simple microscope. See Brewster's *Treatise on the Microscope*, p. 31. But its focus being shortened in proportion as its power is increased, it is necessary that the retina should be brought near its posterior surface. For this purpose, the eyeball is flattened by diminishing the quantity of vitreous humor, which being of nearly the same density as the external water, exerts no perceptible power in bringing the rays of light towards a focus; and this flattened form is maintained by the existence of two cartilaginous plates in the tissue of the sclerotic, which in some of the larger fishes is actually converted into a bony cup. The aqueous humor having here no refractive power, is barely sufficient to allow the free suspension of the iris. The pupil is very large, so as to take in as much light as possible, but is generally motionless. Their eyes being constantly washed by the water in which they live, no lachrymal apparatus is necessary, nor does any exist; and the same remark applies to the *cetacea* amongst the mammals. We thus see that throughout the sub-kingdom of the *vertebrata* the eye is constructed according to one general scheme, with modifications to suit the mode of life of individual classes.

In all the above cases, the structure of the eye is essentially the same; that is to say, we have certain dioptric media for collecting the divergent rays to their proper focus on the retina, and we have the means of adjusting the eye for different distances. But if we examine the eyes of insects, we find that they are constructed on different principles.

In these animals, we have *simple* and *compound* eyes usually associated in the same individual. The simple eyes resemble in many respects the corresponding organs in higher animals, but the compound eyes are extremely elaborate and complex in their structure. They are two in number, appearing as hemispherical masses on the sides of the head. When examined with the microscope, their surface is seen to be divided into an enormous number of hexagonal facets, which are in fact corneæ. In the ant, there are only 50 of these facets in each eye; in the common house-fly, 4,000; in butterflies, upwards of 17,000; and in some of the beetles more than 25,000. Each cornea is found to belong to a distinct eye, provided with a nervous apparatus, and exhibiting a lens, iris, and pupil. Strauss Durckheim, who has carefully studied these structures in the cockchafer, suggests that, the eyes of insects being fixed, nature has made up for their want of mobility by their number, and by turning them in all directions; so that it might be said that these little animals have a distinct eye for every object.

Compound eyes of similar structure occur in many of the crustaceans.

3. Having now described the anatomical structure of the eye in man and certain of the lower animals, we are able to proceed to the consideration of the uses of the various parts of this organ. Assuming a general knowledge of the ordinary laws of geometrical optics (see DIOPTRICS, LENS, etc.), we will trace the course of the rays of light proceeding from any luminous body through the different media on which they impinge. If a luminous object, as, for example, a lighted candle, be placed at about the ordinary distance of distinct vision (about 10 in.) from the front of the eye, some rays fall on the sclerotic, and being reflected, take no part in vision; the more central ones fall upon the cornea, and of these some also are reflected, giving to the surface of the eye its beautiful glistening appearance; while others pass through it, are converged by it, and enter the aqueous humor, which probably exerts no perceptible effect on their direction. Those which fall on and pass through the outer or circumferential part of the cornea are stopped by the iris, and are either reflected or absorbed by it; while those which fall upon its more central part pass through the pupil, and are concerned in vision. In consequence of its refractive power, the rays passing through a comparatively large surface of the cornea are converged so as to pass through the relatively small pupil and impinge upon the lens, which, by the convexity of its surface, and by its greater density towards the center, very much increases the convergence of the rays passing through it. They then traverse the vitreous humor, whose principal use appears to be to afford support to the expanded retina, and are brought to a focus upon that tunic, forming there an exact but inverted image of the object.

This inversion of the image may be easily exhibited in the eye of a white rabbit or other albino animal, after removing the muscles, etc., from the back part of the globe. The flame of a candle held before the cornea may be seen inverted at the back of the eye, increasing in size as the candle is brought near, diminishing as it retires, and always moving in a direction opposite to that of the flame.

The adaptation of the eye to distinct vision at every distance beyond that of a few inches, is extremely remarkable, and numerous attempts have been made to explain the mechanism by which its focal length admits of alteration under the influence of the will. One view that has met with much support is, that the focal length is modified by a slight movement of the lens. In the eye of the bird there is a structure termed the

ciliary muscle, which obviously approximates the lens to the cornea when a short field of view is required, and although the corresponding structure is only slightly developed in man and mammals, it is probably sufficiently strong to produce the slight action required; while for the vision of distinct objects the lens is carried back towards the retina by the elasticity of the connecting tissues. It would appear, however, from the recent researches of Cramer, Helmholtz, Allen Thomson, and others, that the accommodation is effected rather by a change in the *form* than in the *position* of the lens. It has been experimentally proved, that when the eye is turned from a distant to a near object, the antero-posterior diameter of the lens becomes elongated, and the anterior surface becomes more convex, while the opposite changes take place in turning the eye from a near to a distant object. According to Helmholtz, the radius of curvature of the anterior surface of the lens diminishes on turning the eye to a near object from ten to six millimeters (from about 0.4 to 0.24 of an in.), while the most projecting point of the same surface is brought forward about 0.2 of an inch.

Whichever view be adopted, the ciliary muscle takes an active part in the process. According to the observations of Hueck, the focal distance may be changed about three times in a second. The accommodation from a near to a distant object is effected much more rapidly than the converse process.

There are two well-known forms of defective vision in which this power of adaptation is very much limited—viz., short-sightedness or *myopia*, and long-sightedness or *presbyopia*. The limitation, however, is not due to a defect in the muscular apparatus to which we have referred, but to an abnormality either in the curves or in the density of the refracting media. In *short-sightedness* from too great a refractive power from either cause, the rays from objects at the ordinary range of distinct vision are brought too soon to a focus, so as to cross one another, and begin to diverge before they fall on the retina; the eye in this case being able to bring to the proper focus on the retina only those rays which were previously diverging at a large angle from a very near object. The correction for this deficiency is accomplished by interposing between the eye and indistinctly-seen objects a *concave* lens, with a curvature just sufficient to throw the images of external objects at the ordinary distance of distinct vision backwards upon the retina. In *long-sightedness*, on the other hand, there is an abnormal diminution of the refractive power from too flat a cornea, a deficient aqueous humor, or a flattening of the lens, so that the focus is behind the retina. This defect is corrected by *convex* lenses, which increase the convergence of the rays of light. Long-sightedness, as its name *presbyopia* indicates, usually comes on at a comparatively advanced period of life, while short-sightedness is most commonly met with in young persons; but both these rules present occasional exceptions; and the common belief that the latter affection naturally disappears after the middle period of life, is altogether erroneous.

We have already noticed the most essential use of the iris—viz., its power, under the influence of light upon the retina, of modifying the size of the pupil, so as to regulate the amount of light entering the eye. But this is not its only use; one of its offices being to prevent the passage of rays through the circumferential part of the lens, and thus to obviate the indistinctness of vision which would arise from *spherical aberration* (the unequal refraction of the rays passing through the center and near the margin of the lens), in the same manner as the diaphragms employed by the optician. But there are additionally two other means by which this spherical aberration is prevented, which so well illustrate the wondrous mechanism of the eye, that we cannot omit to notice them. They are described by prof. Wharton Jones as follows:

(1.) "The surfaces of the dioptric parts of the eye are not spherical, but those of the cornea and posterior surface of the lens are hyperbolical, and that of the anterior surface of the lens elliptical—configurations found by theory fitted to prevent spherical aberration. This discovery was made at a time when it was not known but that the dioptric parts of the eye had spherical surfaces.

(2.) "The density of the lens diminishing [as we have already shown] from the center to its periphery, the circumferential rays are less refracted than they would have been by a homogeneous lens with similar surfaces. This elegantly simple contrivance has been hitherto inimitable by human art."—*The Actonian Prize Treatise*, 1851, p. 50.

Chromatic aberration, which is caused by the unequal refrangibility of the primitive rays of which white light is composed, when transmitted through an ordinary lens, whereby colored fringes are produced, is *practically* corrected in the eye, although it is doubtful whether it is *entirely* absent. The provision, however, on which the achromatism depends has not been determined with certainty, probably because we do not yet know the relative refractive and dispersive powers of the cornea and humors of the eye. Sir David Brewster denies that the chromatic aberration receives any correction in the eye, and maintains that it is imperceptible only in consequence of its being extremely slight.

4. We have hitherto been considering the eye as an optical instrument which projects pictures of external objects on the retina; we now come to the action of the nervous tunic, the *retina*, and its adaptation to the physical construction of the eye.

When the retina or the optic nerve is stimulated, we have the sensation of light, whatever may be the nature of the stimulus employed—as, for example, if it be a

blow on the eye in the dark, or irritation of the optic nerve from some morbid condition. The sensation of light, then, consists in a recognition by the mind of a certain condition of these nervous structures, and this condition may be induced by the application of any stimulus; the ordinary stimulus obviously being the rays of light which fall upon the retina. There must, however, be a certain amount of light for the purpose of vision. Every one knows that it is difficult and painful to discern objects in a very faint light; and on the other hand, that on suddenly entering a brilliantly lighted room from the dark, everything appears confused for one or two seconds. There is, however, a gradual adaptation of the retina to different amounts of light. Persons long immured in dark dungeons acquire the power of distinctly seeing surrounding objects; while those who suddenly encounter a strong light, are unable to see distinctly until the shock which the retina has experienced has subsided, and the iris has duly contracted. In protecting the retina from the sudden effects of too strong a light, the iris is assisted by the eyelids, the obicular muscle, and, to a certain extent, by the eyebrows. Moreover, the dark pigment of the choroid coat acts as a permanent guard to the retina, and where it is deficient, as in albinos, an ordinary light becomes painful, and the protective appendages, especially the eyelids, are in constant use.

The persistence, during a certain time, of impressions made on the retina, facilitates the exercise of sight. A momentary impression of moderate intensity continues for a fraction of a second; but if the impression be made for a considerable time, it endures for a longer period after the removal of the object. Thus a burning stick, moved rapidly in a circle before the eyes, gives the appearance of a continuous ribbon of light, because the impression made by it at any one point of its course remains on the retina until it again reaches that point. It is owing to this property that the rapid and involuntary act of winking does not intefere with the continuous vision of surrounding objects; and, to give another illustration of its use, if we did not possess it, the act of reading would be a far more difficult performance than it now is, for we should require to keep the eye fixed on each word for a longer period, otherwise the mind would fail fully to perceive it. Again, in consequence of the retention of sensations by the retina, the image of an object may continue to be seen, especially in certain morbid states of the system, and in twilight, for some seconds after the eyes have been turned away from it, and this physiological phenomenon has probably given origin to many stories of ghosts and visions. Thus, if a person has unconsciously fixed his eyes, especially in the dusk, on a dark post or stump of a tree, he may, on looking towards the gray sky, see projected there a gigantic white image of the object, which may readily be mistaken for a supernatural appearance. These ocular spectra are always of the complementary color to that of the object. Thus, the spectrum left by a red spot is green; by a violet spot, yellow; and by a blue spot, orange. However great may be the velocity of a luminous body, it can always be seen; but if an opaque body move with such rapidity as to pass through a space equal to its own diameter in a less time than that of the duration of the retinal impression, it is altogether invisible; and hence it is, for example, that we cannot see bullets, etc., in the rapid part of their flight.

A small portion of the retina, corresponding to the entrance of the optic nerve, is incapable of exciting the sensation of vision when it receives the image of an object. According to Volkmann, this small invisible spot exactly corresponds in size with the artery lying in the center of the optic nerve. If the "blind spot" had been situated in the axis of the eye, a blank space would always have existed in the center of the field of vision, since the axes of the eyes in vision correspond. But as it is, the blind spots do not correspond when the eyes are directed to the same object; and hence the blank which one eye would present is filled up by the other eye. Mariotte, early in the last century, first described the existence of these blind spots. Any one may satisfy himself of their existence by the following simple experiment. Let two small black circles be made upon a piece of paper, about four or five inches apart, then let the left eye be closed, and the right eye be strongly fixed upon the left-hand circle. If the paper be then moved backwards and forwards, a point will be found at which the right-hand circle is no longer visible, although it reappears when the paper is either brought nearer or removed further. Although no other part of the retina possesses the complete insensibility presented by the blind spot, it is probable that its anterior portions have very little to do with vision. When using only one eye, we direct it towards the object we wish to inspect, in such a way as to throw the image to the back of the globe; and when the eye is thus fixed, objects near the boundary of the field of vision are less distinctly seen than those at its center.

The extent of the field of vision for a single eye, the head being fixed, has been calculated by Dr. Young. He found that the eyeball was capable of a movement of 55 degrees in every direction, so that a single eye may have perfect vision of any point within a range of 110 degrees.

We have not yet referred to the longitudinal range, or greatest distance of human vision; indeed, this range varies so extremely that it is difficult to assign an arbitrary limit to it. Many uncivilized races, as the North American Indians, and the inhabitants of the vast Asiatic steppes, possess powers of sight which would appear almost incredible if they had not been thoroughly and frequently corroborated. Our information is more definite regarding the limits of human vision in regard to the minuteness of the

objects of which it can take cognizance. Ehrenberg has carefully studied this subject; and has arrived at the following results. The side of the smallest square magnitude usually visible to the naked eye—either of white particles on a black ground or conversely—is about $\frac{1}{100}$th of an inch; and with the greatest condensation of light and effort on the part of the observer, squares with a side as small as $\frac{1}{300}$th of an inch *may* be recognized, but without sharpness or certainty. Bodies smaller than these, when observed singly, cannot be discerned by the *naked* eye, but may be seen when placed in a row. Much smaller particles may, however, be distinctly seen, if they powerfully reflect light; thus, gold-dust, which in none of its diameters exceeded $\frac{1}{1200}$th of an inch, is easily discernible in common daylight. The delicacy of vision is far greater for lines than for minute areas, since opaque threads of $\frac{1}{2000}$th of an inch may be discerned when held towards the light.

Various topics which the reader might perhaps have expected to find noticed, such, for instance, as "single vision with two eyes," "the appreciation of solid forms by the sense of vision," "correct vision with an inverted image on the retina," etc., which belong fully as much to metaphysics as to physiology, are discussed in the article on VISION. We may also refer those who desire information on these points to prof. Bain's treatise on *The Senses and the Intellect.*

EYE, DISEASE OF THE. The diseases of the eye enumerated by the surgeon are very numerous, partly from the variety of the tissues and parts of which it is formed, partly because the exposed situation and transparency of the eye enable the diseases to be seen. Nearly all its parts are liable to inflammation and its consequences. See OPHTHALMIA. The eyelids are liable to various diseases, as growths of several kinds, most of which the surgeon may remove; inflammation, as blear-eye (ophthalmia tarsi); to be misdirected inwards or outwards, *entropium* and *ectropion* (q.v.); and the upper eyelid may fall down (ptosis) from palsy of the common motor oculi nerve. The eyelashes may grow in upon the eye (trichiasis), and produce serious results. When plucked out, they grow again; and if they still grow in upon the eye after this palliative treatment has been tried several times, the surgeon has to cut down on their roots, and destroy them. The duct which conveys away the tears to the nose is liable to inflammation and obstruction, causing watery eye. See LACHRYMAL ORGANS. The cornea is liable to opacity in various degrees. The mere *nebula* or cloudy condition, either limited or general, may pass off, and leave the cornea again clear; but the white mark, which is the cicatrix or scar of an ulcer, is permanent, although it may become smaller by the disappearance of the surrounding haze. The pupil may be closed as the result of iritis, or of operations for cataract, and an artificial pupil may be made by either of the three methods—incision, excision, or separation—but the operation is seldom attended with success. For opacities of the crystalline lens, see CATARACT. For an account of diseases of the nervous parts of the eye, see AMAUROSIS. Various affections of vision may arise from peculiar or altered conditions of the refracting humors of the eye—as near-sightedness (myopia), far-sightedness (presbyopia), the appearance of bodies (muscæ) floating in or before the eye; and there may be double vision (diplopia), with two eyes or with one. See VISION. The parts between the eye and its bony orbit may be the seat of inflammation, abscess, or tumor, making the eye protrude. The movements of the eyeballs may be affected from palsy of the motor nerves, or from contraction of the lateral recti muscles, causing inward or outward squinting. See SQUINTING. The eye may lose all feeling, from palsy of the fifth pair of nerves. The whole of the same side of the face, nostril, and mouth, will be in the same condition, and the eye becomes inflamed and disorganized. Substances thrown against the eye may injure it. Quicklime is rapidly destructive to the eye, slaked lime and mortar less so. When one of these, or any other caustic, has got into the eye, sweet oil is the best thing to introduce, until the surgeon arrives to remove them. If it is oil of vitriol (sulphuric acid) that has been the cause of the injury, a weak solution of soda may be used in the first place to neutralize the acid. In gunpowder explosions near the eye, besides the burn, the particles are driven into the surface of it, and will cause permanent black stains over the white of the eye, unless they are carefully removed at the time. When chips of glass, stone, etc., are driven into the interior of the eye, there is little hope of it being saved from destructive inflammation. When only partially sunk into the cornea, as is often the case with sparks of hot iron, or "fires," as they are called, the rubbing of the projecting part on the eyelid causes great pain, and the surgeon has not much difficulty in removing them. Most commonly these, or other "foreign bodies," as particles of dust, sand, seeds, flies, etc., merely get into the space between the eyeball and the lids, almost always concealed under the upper, as it is the larger, and sweeps the eye. They cause great pain, from the firmness and sensitiveness of the papillary surface of the lid, soon excite inflammation, and their presence, as the cause, is apt to be overlooked. The lid must be turned round to find them. To do this, pull the front or edge of the lid forwards by the eyelashes, held with the finger and thumb, and at the same time press down the back part of the lid with a small pencil or key. The lid will readily turn round, when the body may be seen about its middle, and may be removed with the corner of a handkerchief. Another plan, which the person himself may try, is to pull forward the upper lid by the eyelashes, and push the lashes of the lower lid up behind

it, when the foreign body may be brushed out. After the bodies are removed, a feeling as if they were still there may remain for some time.

EYEBRIGHT, *Euphrasis,* a genus of plants of the natural order *scrophulariaceæ,* having a tubular calyx, the upper lip of the corolla divided, the lower of three nearly equal lobes, the cells of the anthers spurred at the base, a two-celled capsule and striated seeds. Some of the species are root-parasites. The only British species is the COMMON E. (*E. officinalis*), a little plant of at most 6 or 8 in. in height, with ovate serrated leaves, and white or reddish flowers streaked with purple, appearing singly in the axils of the leaves. It is very abundant in many pastures, and even on high mountains, where—as in very northern regions—it is often to be seen of only an inch in height, gemming the ground abundantly with its bright little flowers. It is a very widely distributed plant, a native of most parts of Europe, the n. of Asia, the Himalaya, etc. It was once in great repute as a cure for ophthalmia, and is still much used in rustic practice for diseases of the eye. A spot on the corolla, something like a pupil, gave it much of its reputation, whilst the fanciful doctrine of *signatures* prevailed in medicine; but it has been found really efficacious in catarrhal inflammations of the eye, and in other catarrhal affections. It is a weak astringent. It is the *euphrasy* of Milton, with which he represents the archangel Michael as *purging the visual nerve* of Adam.

EYE-PIECE, the name given to the microscope by means of which the image of the object formed in the focus of a telescope is observed. See TELESCOPE.

EYE-STONE (see OPERCULUM). This article was formerly much used, and is still to some extent, to remove foreign substances from the eye. It is put under the lid, is moved around by the motion of the eye, and dust or cinders adhere to it and are taken out with it.

EYLAU, usually called Prussian Eylau, a t. in the government of Königsberg, and 22 m. s. of the town of that name, contains about 3,000 inhabitants, and is celebrated for the battle fought there between Napoleon and the allies—Russians and Prussians—under Bennigsen, Feb., 8, 1807. The French force amounted to about 80,000, and the allies numbered 58,000, but were superior in artillery. The battle was opened soon after daylight by a furious attack made by the French left on the Russian right and center, which, however, proved utterly unsuccessful, the attacking corps being all but completely destroyed. The murderous struggle was repeatedly renewed, and the promise of victory alternated now to the one side and now to the other. Night closed upon the whole allied line pressing onward and driving the French before them. Nevertheless, the victory is generally claimed by the latter, chiefly because the allied forces, unable to recruit their strength, were ordered to retreat from the field on the night of the battle, and to retire upon Königsberg. The loss of the allies is estimated at about 20,000, while that of the French must have been considerably greater.

EYRE, CHARLES, b. England, 1817; a Roman Catholic priest in Newcastle, canon of the diocese of Hexham and Newcastle; vicar-general; archbishop for the w. district, and in 1868, apostolic delegate for Scotland. He is now archbishop of Glasgow. He is the author of a *History of St. Cuthbert.*

EYRE, EDWARD JOHN, a distinguished explorer and colonial governor, is the son of an English clergyman in Yorkshire, and was b. in 1817. Emigrating to Australia at the age of seventeen, he was prosperous as a squatter, and soon became a magistrate. In 1840, he failed in an attempt to explore the region between south and western Australia—a task he accomplished, in spite of enormous difficulties, in 1841. In 1846, he became lieut.gov. of New Zealand, and in 1852, of St. Vincent. In 1862, he was appointed governor of Jamaica, where in 1865 negro disturbances broke out. E., resolving on prompt measures, proclaimed martial law; a Mr. Gordon, believed to have had a leading part in the rising, was hurriedly tried by court-martial, and hanged two days after, the sentence having been confirmed by Eyre. A commission sent to inquire into this case, found that Gordon had been condemned on insufficient evidence, and E. was recalled. On his return he was prosecuted for murder by a committee of whom J. Stuart Mill was the most prominent; Mr. Carlyle and sir R. Murchison promoted the E. defense fund. The charge of murder was dismissed by the magistrates of Market-Drayton in 1867. Since then E. has lived in retirement.

EZE'KIEL (meaning "God will strengthen," or "strength of God"), one of the Hebrew prophets, was the son of the priest Buzi, and along with Jehoiachin, king of Judah, was carried captive, when still a young man, to Mesopotamia, by order of Nebuchadnezzar, about 598 B.C. He was a member of the Jewish community which settled on the banks of the river Chebar, and first appeared as a prophet about the year 594 B.C. His prophetic career extended over a period of 22 years. The date of his death is not recorded.—The book of Ezekiel consists of three parts: the *first* (chaps. i.–xxiv.), composed before the final conquest of Jerusalem by Nebuchadnezzar, announces the complete overthrow of the kingdom of Judah, on account of its increasing unfaithfulness to God; the *second* (chaps. xxv.–xxxii.) threatens the surrounding nations, which were exulting maliciously over the ruin of Judah, with divine punishment; and the *third* (chaps. xxxiii.–xlviii.) prophesies the future deliverance of the Hebrew nation, and the rebuilding of Jerusalem. This last portion is generally believed to contain several Messianic predic-

tions, three of which are considered specially remarkable (chaps. xxxvi.–xxxvii., xxxviii.–xxxix., and xl.–xlviii.); and it is beyond all question that only under a world-wide dispensation like the Christian, can the glorious visions of the prophet receive a historical realization. The book is full of magnificent but artificial symbolism, and of allegories difficult to understand; whence Jerome calls it "a labyrinth of the mysteries of God;" but here and there, as in chapters 1st and 2d, it contains visions that indicate the possession on the part of E. of a most vivid and sublime imagination. E.'s authorship of the book has been questioned. The Talmud says, it was written by the great synagogue, of which E. was not a member; and Ewald, believing that traces of later elaboration are quite obvious, suggests that the collection and combination of the various prophecies into a book may not have been the prophet's own doing. The opinion of most critics, however, is, that a prophet who was so much of a literary artist as E., was more likely to have completed the book himself than to have left such a work to others. The text is far from being in a perfect condition. It is partly corrupted by glosses, has partly been retouched by later hands, and may often be amended by the Septuagint version. The best commentaries on the book of Ezekiel are those of Hävernick (Erlangen, 1843) and Hitzig (Leip. 1847).

EZEKIEL, BOOK OF (Ezekiel, *ante*), consists of an *introduction* (chapters i.–iii.) reciting the glorious vision in the midst of which Ezekiel received his call to the prophetic office, his commission to Israel, and his encouragements from God; and *three principal parts*.

I. Prophecies against the people of Israel (chapters iv.–xxiv.), subdivided into 18 sections. 1. The siege of Jerusalem, represented by a picture drawn on a tablet; the prolonged transgressions of the people, by the prophet's continued reclining on his side; and the hardships they should suffer, by the eating of coarse and loathsome bread. 2. Judgments on the city by famine, war, and dispersion abroad, signified by hair and beard cut off, weighed, scattered, and burned. 3. Judgments against idolatry, with a promise that a remnant should be saved. 4. Captivity, inevitable and severe, under the emblem of a chain. 5. Transgressions of Judah, represented by the image of jealousy; and consequent judgments, typified by the scattering of fire, and the departure of the shekinah. 6. The captivity of Zedekiah, represented by the removal of household goods, and bread eaten with trembling. 7. False prophets reproved and threatened. 8. Idolatrous elders condemned. 9. The rejection of Jerusalem, represented by the burning of an unfruitful vine. 10. God's compassionate love, against which Israel had sinned, compared to kind care shown to a child cast out at its birth. 11. Judgments on Israel for turning to Egypt for help against Babylon, denounced under the emblem of two great eagles, one representing Nebuchadnezzar, and the other Pharaoh. 12. Judgment denounced on every transgressor for his own sins, contrary to the common proverb implying that children suffer for their fathers' faults. 13. Captivity of the Jewish kings, represented by lions pursued and captured, and of the Jewish people, by a vine scorched, torn up, and planted in the wilderness. 14. God's mercies to Israel, and their continued transgressions reviewed; and, while final forgiveness is promised to the penitent, impending judgments are declared. 15. A consumed forest represents Jerusalem destroyed, and a sharp sword, Nebuchadnezzar cutting down Ammonites and Jews. 16. Recital of sins committed in Jerusalem by all classes of the people, and judgments on them denounced. 17. Idolatries of Samaria and Jerusalem, and their punishment. 18. Dreadful destruction of Jerusalem again proclaimed.

II. Prophecies against various nations around Judea (chapters xxv.–xxxii.), subdivided into three sections. 1. Against the Ammonites, Moabites, Edomites, and Philistines. 2. Against Tyre (represented, in its beauty, wealth, and renown, as the anointed cherub on the mountain of God) with a promise of returning prosperity to Israel. 3. The destruction of Egypt foretold and illustrated by a recital of Assyria's glory and fall under the emblem of a cedar of Lebanon cut down.

III. Promises of future deliverance to Israel (chapters xxxiii.–xlviii.) subdivided into 6 sections. 1. The prophet is compared to a watchman appointed to give warning of danger, and is exhorted to be faithful. While under the power of the prophetic spirit, being informed that Jerusalem had been taken by Nebuchadnezzar, he foretells the desolation of the land, and reproves the hypocrisy of the captives around him. 2. The rulers, civil and ecclesiastical, condemned as unfaithful shepherds, and a general restoration of the people promised under the guidance of the good shepherd, David the prince. 3. Judgments against Edom again foretold. 4. Promises of restoration renewed to Israel, under the emblems of fruitful mountains, sprinkled water, a new heart, dry bones raised to life, and two sticks united together. 5. Destruction of Gog and Magog, followed by blessings to Israel. 6. Vision of the temple, the returning glory of the Lord, the division of the land, the healing waters from the sanctuary, the portions of the tribes, the city with 12 gates whose name shall be, "The Lord is there."

EZION-GABER, or Ezion-Geber, the last station of the Israelites before coming to "the wilderness of Zin, which is Kadesh." It was subsequently the station of Solomon's navy; that at which Jehoshaphat's ships were broken. This port, of which no trace remains, is supposed to have been at the modern Ain-el Ghudyan, about 10 m. up the dry bed of the Arabah, and near Elath, or Berenice.

EZ'RA, a Jewish lawgiver of the 5th c. before Christ. He was descended from a distinguished priestly family, and was resident in Babylon in the reign of Artaxerxes Longimanus. With this monarch he seems to have been in considerable favor, and in the year 478 B.C. obtained permission to return to Jerusalem with a band of his countrymen amounting to 1754. His services to the new colony in regard to their civil and religious condition were very important. He endeavored to reimpose more strictly the law of Moses forbidding marriages with heathen women, and disannulling such ties where they had been formed. He also introduced into Jewish literature the square Chaldee character, instead of the old Hebrew or Samaritan one, which had been customary till then; but the tradition that he rewrote from memory the sacred books burned at the destruction of the temple, deserves no regard; and it is likewise a mere tradition that as president of the socalled great synagogue (an assemblage of Jewish scholars) he arranged and completed the canon of the Old Testament. See BIBLE.—The book called by his name, along with the book of Nehemiah, formed, among the Jews, the first and second books of Ezra. It records events which extended over a period of nearly 80 years, and divides itself naturally into two parts. The first six chapters embrace a period of 21 years, and relate the history of the first return from the Babylonish captivity; the rest of the book chronicles the *second* return under Ezra the priest, in the reign of Artaxerxes Longimanus. The book is partly written in Chaldee, and is probably the work of various authors.

EZRA, BOOK OF (EZRA, *ante*), records portions of Jewish history after the captivity. It is divided into two parts, the first of which, comprising six chapters, contains: 1. The decree of Cyrus giving permission to the Jews to return to their own land and rebuild their temple. 2. The record of his restoration of the sacred vessels of silver and gold (numbering in all 5,400) which Nebuchadnezzar had taken from the temple and brought to Babylon. 3. The return of a portion of the people and their commencement of the work. 4. The obstacles placed in their way by men who had taken possession of the land, and, consequently, did not wish the Jews to be re-established in it. 5. When this opposition had continued more than 20 years, Darius Hystaspis, having found the decree of Cyrus, confirmed it and gave the Jews additional privileges and help by which they were enabled to complete their temple and re-establish divine worship. After an interval of nearly 60 years, the second part, comprising four chapters, contains: 1. The decree of Artaxerxes giving Ezra authority to proceed to Jerusalem, with all Jews who wished to accompany him, and re-establish the Jewish state. On this occasion, the king, with his counselors, added large sums of silver and gold to the free-will offerings of the people, and also directed his treasurers in the provinces intervening between Babylon and Jerusalem to furnish the expedition liberally with needed supplies. 2. The arrival of Ezra accompanied by about 1500 chief men and 200 priests and Levites. 3. The reconstruction of the religious and social state of the Jews in accordance with the law of Moses. This reformation included the very difficult work of annulling the marriages which many had made with heathen families of the land. The Jews have always maintained the canonical authority of this book, giving it an equal place with the Pentatauch, and comparing Ezra with Moses. Ezra is justly regarded as the author of the whole book, although in the first part, relating to the actions of others, he drew his materials from various sources; in the second part only he describes events in which he was an eye-witness, a prominent actor, and the chief director.

F

F, THE sixth letter in the Latin and English alphabets, corresponding to the *vau* of the Hebrew, and the *digamma* (q.v.) of the old Greek alphabet. See ALPHABET. *F* and *v* are called *labio-dentals*, from the organs employed in producing them; they belong to the class of consonants called aspirates (q.v.), and bear the same relation to each other that exists between the unaspirated labials *p* and *b*. In Latin, *f* had a peculiar sound, different from that of Greek *φ*, as we learn from Cicero and other Latin writers. What the sound was, we do not exactly know, but it approached to the nature of a strongly breathed *h*, as is indicated by the fact, that in the Sabine dialect it sometimes takes the place of *h*, as Sab. *fircus* = Lat. *hircus* (a he-goat); and the Latins made use both of *faba* and *haba* for "a bean." This affinity is also shown in modern Spanish, where *h* takes the place of the Latin *f;* as Lat. *femina*, Sp. *hembra; fl* becomes, in Spanish, *ll*, as Lat. *flamma* = Sp. *llama*. F, in English and other Teutonic tongues, corresponds to *p* in Greek and Latin; as Lat. and Gr. *pater* = Eng. *father;* Gr. *pod-*, Lat. *ped-* = Eng. *foot;* Lat. *pisc-* = Eng. *fish;* Gr. *pur* = Eng. *fire;* Lat. *vulp-* = Eng. *wolf*. In some words, *v* takes the place in German of *f* in English; as Ger. *vater* = Eng. *father;* Ger. *vier* = Eng. *four*. In the Aberdeenshire dialect, *f* takes the place of *wh*, as *fat* for *what; fup* for *whip*. This seems to be a relic of the Teutonic pronunciation of *w* (= *v*), still to be observed in the Cockney pronunciation of *vill* for *will, ven* for *when;* but why the sharpening of the labial into *f* should be confined to one circumscribed district of Scotland, and to the case of *w* followed by *h*, it is hard to say.

F in Lat. and Greek becomes *b* in Eng.; as Gr. and Lat. *fer-* = Eng. *bear;* Lat. *frater* = Eng. *brother.* See Letter B.

More remarkable are the interchanges between *f* and the series *d, th, t.* Lat. *foris* = Gr. *thura,* Eng. *door;* Lat. *fera* = Gr. *ther,* Eng. *deer;* Eng. *red,* Sans. *ruthira,* Gr. *eruthros,* Lat. *rutilus, rufus, ruber.* In Russian, *Fiodor, Afanasja* = *Theodor, Athanasia.* In words originally common to both Greek and Latin, the Greek φ is represented in Lat. by *f;* as Gr. φημη = Lat. *fama.* But in spelling Greek words with Latin letters, the Romans, after the time of Cicero, were careful to represent φ, not by *f,* which had a somewhat different power, but by *ph.* This mode of spelling words derived from Greek is still adhered to in English, German, and French, although the distinction in sound has long been lost sight of. The distinction began to disappear in the Latin itself in the time of the later Roman emperors, when inscriptions show such spelling as *Afrodite* for *Aphrodite;* and this simplification is followed in modern Italian, Spanish, and Portuguese. *Ph* is sometimes erroneously used in words having no connection with Greek; as Adolphus, for the Teutonic Adolf or Adalolf—i.e., "noble wolf."

F, in music, is the fourth note of the natural diatonic scale of C, and stands in proportion to C as 4 to 3, and is a perfect fourth above C as fundamental note. F major, as a key, has one flat at its signature—viz,, B flat. F minor has four flats the same as A flat major, of which it is the relative minor.

FAAM, or FAHAM (*angræcum fragrans*), an orchid, native of India and the Mascarene isles, much prized in the east for the delightful fragrance of its leaves, which is owing to the presence of *coumarin* (q. v.), and resembles that of the tonka bean and of vernal grass. In the isle of Bourbon, an infusion of F. leaves is in great repute as a cure for pulmonary consumption and as a stomachic. In France, it has been successfully employed, under the name of *isle of Bourbon tea,* as an expectorant, anti-spasmodic, and stomachic.

FABA, a genus of plants to which belongs *faba vulgaris,* or *vicia faba,* the common bean of Europe. The beans generally cultivated in America are of the genus *phaseolus.*

FABACEÆ. See LEGUMINOSÆ.

FA'BER is the name of two artists, father and son. John F., the elder, was b. in Holland, where he acquired a knowledge of the art of mezzotint-engraving. Subsequently, he came to England, and died at Bristol, May, 1721. His works do not exhibit much talent.—The younger F., also called John, obtained, however, a high reputation as an engraver in mezzotint. His principal works are the portraits of the Kit-cat club, and the beauties of Hampton court, several of which are executed with great freedom, vigor, and beauty. F. lived in London, where he is believed to have died in 1756.

FABER, CECILIA BÖHL VON, 1797–1877; a celebrated novelist of Spain, better known by her masculine pseudonym of FERNAN CABALLERO. She was educated in Spain and Germany, and became an accomplished linguist. In 1813, she returned to Cadiz, and the next year married capt. Planells, whom she accompanied to America, where she passed a number of years of her married life. Not long after the death of her first husband she was married to the marquis de Arco Hermoso, and was a frequent attendant at the Spanish court, where her beauty, vivacity, and wit were much admired. Her second husband died in 1835, and in 1837 she married señor de Arrom, a member of the bar. The union was unfortunate, and it is to the trials and disappointments of her later life that the world is indebted for her literary works. Washington Irving visited her, and encouraged her to pursue Spanish literature, but it was many years later before *The Family of Alvareda,* her first work, was given to the public, nor was it until after her 50th year that she appeared as an author at all, and then under an assumed name. Her works soon became popular, and were translated into French and German, so that within ten years she gained a European reputation. A collected edition in 13 vols. was issued from the Madrid press in 1859, and about the same time she was appointed governess of the royal children. Among the many schemes of her busy life was one for the prevention of cruelty to animals.

FABER, FREDERICK WILLIAM, D.D., 1814–63; b. England; educated at Oxford. He gave up his Calvinist views and became an enthusiastic admirer and follower of John Henry Newman. In 1841, he traveled on the continent, and recorded his observations in *Sights and Thoughts in Foreign Churches and among Foreign Peoples.* In 1845, he was converted to the Roman Catholic faith, and founded a religious community at Birmingham, called Wilfridians, after the name Wilfrid, which he had assumed. This community was ultimately merged in the oratory of St. Philip Neri, of which Newman was the head; and in 1849 a branch was established in London over which Faber presided till his death. He published a number of theological works, and edited the *Oratorian Lives of the Saints,* but it is mainly as a writer of fervent and deeply tender devotional hymns that he is known.

FABER, Rev. GEORGE STANLEY, a learned and voluminous divine of the Anglican church, was the eldest son of the Rev. Thomas Faber, and was b. 25th Oct., 1773. He entered university college, Oxford, in 1789, where he achieved a brilliant academical reputation. Before his 21st year, he was elected fellow and tutor of Lincoln college.

In 1796, he took his degree of M.A.; was Brampton lecturer for 1801, in which capacity he delivered the lectures subsequently published under the title of *Horæ Mosaicæ;* and in 1805 became vicar of Stockton-on-Tees, in the country of Durham. After several changes, he received from bishop Van Mildert, in 1832, the mastership of Sherburn hospital, near the city of Durham, where he died 27th Jan., 1854. F. wrote upwards of forty works, several of which, especially those upon prophecy, have enjoyed a very extensive popularity. All his writings are marked by "strong masculine sense, extensive classical erudition, and a hearty love of hypothesis." The principal are—*The Genius and Object of the Patriarchal, the Levitical, and the Christian Dispensations* (1823, 2 vols.); *The Difficulties of Infidelity* (1824); *The Sacred Calendar of Prophecy* (1828, 3 vols.); *The Primitive Doctrine of Election* (1836), reckoned by some critics the most valuable of all F.'s writings; *The Primitive Doctrine of Justification* (1837); and *Eight Dissertations upon the Prophetical Promises of a Mighty Deliverer* (1845, 2 vols.).

FABER, or LEFÈVRE, JACOBUS, 1450–1536; surnamed STAPULENSIS; b. Picardy; a pioneer of the Protestant movement in France. He was a graduate of the university of Paris, and professor in the college of cardinal Lemoine. Though his works were very obnoxious to the Roman church he was safe from persecution under the king's protection until the king was taken prisoner at the battle of Pavia. He was then formally condemned, and his works were suppressed; but on the return of Francis all such proceedings were stopped. Among his works were the *Physics, Metaphysics, and Ethics of Aristotle;* and *A Psalter* in five languages. In 1512, he issued a translation into French of the Epistles of St. Paul, and of the whole New Testament in 1523, of the Pentateuch in 1528, and in 1530 of the whole Bible. His work has been the basis of all subsequent French versions. He also published notes and comments constantly exalting the Bible above the church as the rule for human conduct. When the princess Margaret became queen of Navarre, she gave Faber an asylum beyond the reach of his persecutors, where he passed his old age in quiet.

FABIAN GENS. See FABIUS, *ante.*

FA'BIUS, the name of one of the oldest and most illustrious patrician families of Rome. Three brothers of this name alternately held the office of consul for seven years (485–479 B.C.). In 479, the Fabii, under K. Fabius Vibulanus, migrated to the banks of the Cremera, a small stream that flows into the Tiber a few miles above Rome. Here, two years after, they were decoyed into an ambuscade by the Veientes, with whom they had been at war, and, with the exception of one member, who had remained at Rome, and through whom the race was perpetuated, the entire *gens,* consisting of 306 men, were put to the sword. The most eminent of the Fabii were Quintus Fabius Rullianus —supposed to have been the first who obtained for himself and his family the surname of *Maximus*—and his descendant, Quintus Fabius Maximus Verrucosus, named Cunctator, the delayer. The former was the most eminent of the Roman generals in the second Samnite war, and was twice dictator, and six times consul. The later, who, in the course of his career, was five times consul, and twice censor, was elected dictator immediately after the defeat of the Romans at Trasimenus. The peculiar line of tactics which he observed in the second Punic war obtained for him the surname by which he is best known in history. Hanging on the heights like a thundercloud, to which Hannibal himself compared him, and avoiding a direct engagement, he tantalized the enemy with his caution, harassed them by marches and countermarches, and cut off their stragglers and foragers, while at the same time his delay allowed Rome to assemble her forces in greater strength. This policy—which has become proverbial as "Fabian policy"—although the wisest in the circumstances, was neither appreciated in the camp nor at home; and shortly after, Marcus Minucius Rufus, master of the horse, was raised to an equal share in the dictatorship, a position, however, which he occupied but for a short time. During his fifth consulship, Fabius recovered Tarentum, which had long been one of Hannibal's important positions. He died in 203 B.C. C. Fabius, surnamed Pictor, executed upon the walls of the temple of Salus —dedicated by the dictator C. Junius Brutus Bubulus in 302—the earliest Roman paintings of which we have any record; and his grandson, Q. Fabius Pictor, was the first writer of a Roman history in prose.

FA'BLE (Lat. *fabula*) is a word of twofold signification. First, it is employed by some writers in a general sense to denote any fictitious narrative, as, for example, the incidents in an epic or dramatic poem. At one time also, when the myths of the Greeks and Romans were thought to be satisfactorily accounted for by regarding them as conscious inventions of the ancient poets and priests, it was customary to speak of them as *fables,* but this application of the term is now abandoned by scholars. See MYTH. According to the second and more frequent signification of the word, it denotes a special kind of literary composition, either prose or verse, in which a story of some kind is made the vehicle for conveying a universal truth. It differs from a parable in this respect, that while the latter never transcends in conception the bounds of the probable or the possible, the former always and of necessity does. The story of the "Good Samaritan" imagined by the Savior, is a parable; if it was not true, it might have been, for it contains nothing either improbable or impossible; but when Jotham went up to the top of Mt. Gerizim, and spoke to the men of Shechem about the trees going

forth to anoint a king over them, he made use of the F. proper. The peculiarity, therefore, of the *structure* of the F. consists in the transference to inanimate objects, or, more frequently, to the lower animals, of the qualities of rational beings. By the very novelty and utter impossibility of the representation, the interest of the hearer or reader is excited, and thus its symbolic meaning and moral became transparent to him, at least if the F. is well contrived. The ancient fabulists were simple, clear, and earnest in their representations. They seem to have sprung up in the east. Among the more celebrated are Bidpai (q.v.), or Pilpai, and the Arabian Lokman, who is said to have lived in the time of king David. Among the Greeks, the greatest name is that of Æsop (q.v.), whose fables, at a much later period—the precise time is not exactly known—were versified by a certain Babrius (q.v.). Among the Romans, Phædrus cleverly imitated Æsop, but with considerable modifications, thus giving a certain amount of independent value to his work. It is perhaps worth mentioning here, that the well-known F. of the *Town Mouse and Country Mouse*, told by Horace, is of purely Roman origin, and is probably the only one in existence of which that can be affirmed. Leaving the classical period, and before entering on the dark ages, we encounter the name of Aphthonius, who flourished in the early part of the 4th c., and who wrote indifferent fables in Greek prose; and still later, the name of Flavius Avianus, who composed forty-two, no better, in Latin elegiacs. During the dark ages, the F. in various forms appears to have been cultivated in the monasteries, although nothing meritorous has survived; but in the middle ages, it acquired fresh life and vigor. An edition of the fables current in Germany in the time of the Minnesingers has been published by Bodmer. The oldest known German fabulist is Stricker, who lived about the middle of the 13th c.; but the famous mediæval F. of *Reineke Fuchs*, or the History of Reynard the Fox (q.v.), stretches in some of its numerous primitive forms much further back. In later times, most nations have cultivated the F. with more or less success. We may mention among the English, Gay; among the Germans, Hagedorn and Gellert, and Lessing; among the Italians, Pignotti; among the Russians, Krylov; and above all, among the French, La Fontaine, whose fables are remarkable for their arch and lively humor, their delicate sarcasm, their sagacity, and felicity of expression. Now, however, the F. has gone entirely out of fashion.

FABLIAU, plur. FABLIAUX (from the Latin *fabulari, fabellare*, to speak or to tell), was the name given in the old French literature to a class of short metrical narratives, intended merely for recitation, and which had for their subject-matter the talk and news of the day in the middle ages. The narrator of such news was called a *fableor* (plur. *fablière*), in opposition to the *chanteor*, or singer proper, who composed poems not only for recitation, but also for singing. Besides the fabliaux, the department of the fableor embraced the *Romans d'aventure* (in short unstrophied couplets), usually called *contes*, whence their author or reciter also bore the name of *conteur;* and the *dits*, or sayings, the special cultivator of which was termed a *diseur*. As the fabliaux were fundamentally distinguished from the more genuine forms of poetry by the every-day character of their subject-matter, so the mode of treatment which their authors adopted was also more anecdotical, epigrammatic, and witty—the wit being richly spiced with scandal. They appear to have maintained a sort of ironical and parodistic antagonism to the idealism of the epics of chivalry. In these fabliaux, the essential character of the French people manifested itself, and that opposition of the real to the ideal, of the understanding to the imagination, which, after the time of Francis I., began to characterize French literature generally. Thus they lashed not only the priesthood and the nobility in their actual degeneracy, but, from the very character of their satire, they engendered a contempt for the religious-chivalric spirit itself, and for all ecclesiastical and knightly notions and ceremonies. The oldest fabliaux are not of French origin; they are a fruit of the crusades, and were brought to France from the east, but they received a national coloring, and soon took root in the west. From them sprung the drama of France. One of the most fecund fablière was Rutebeuf, who flourished in the reigns of Louis IX. and Philippe III., whose works were published by Jubinal (2 vols., Paris, 1837). He was a true Parisian, and the prototype of Villon, La Fontaine, and Voltaire. The best collections of fabliaux and contes are those of Barbazan (3 vols., Paris, 1756), of Méon (2 vols., Paris, 1823), and of Jubinal (2 vols., Paris, 1839–43).

FABRE, FRANÇOIS XAVIER PASCAL, 1766–1837; b. France; a painter, pupil of David. One of Fabre's earliest productions, "Execution of the Children of Zedekiah by order of Nebuchadnezzer," secured for him the great prize of the academy. It was supposed that he was privately married to the duchess of Albany, who at her death made him her sole heir.

FABRETTI, RAFFAELE, a distinguished antiquary and archæologist, was b. at Urbino 1618, and was attracted at an early period to antiquarian studies by the great classical remains of Rome. Under pope Alexander VII. he became papal treasurer, and subsequently was appointed chancellor to the papal embassy at Madrid. A residence of 13 years in Spain enabled him to explore all the antiquities of the kingdom, and to carry his studies to a point which rendered indispensable his return to Rome, the great parent fount of ancient learning. He was there made judge; and under Innocent XII., became keeper of the papal archives of the castle of St. Angelo, a post which afforded

the widest scope to his favorite pursuits. About this time he wrote his two important works: *De Aquis et Aquaductibus Veteris Romæ* (4 vols., 1680, reprinted with notes and additions in 1788), and *Syntagma de Columnâ Trajani* (Rome, 1683). His treatise entitled *Inscriptionum Antiquarum Explicatio* (1699) throws invaluable light on the discoveries made by himself in the catacombs; and his erudite investigations concerning the reliefs known as the Iliac tables, and the grand subterranean canals of the emperor Claudius, are equally full of interest to science. His rare collection of inscriptions, etc., is deposited in the ducal palace of Urbino. F. died in 1700.

FABRIA'NO, a city of Italy, in the province of Ancona (formerly part of the papal states), is situated at the eastern base of the Apennine range, 28 m. w. of Macerata. It has a cathedral, and several convents, but is chiefly worthy of mention on account of its great paper manufactures, which were established in 1564. The churches and private houses contain many specimens of the school of painting which flourished here. Pop. '71, 7,612.

FABRIA'NO, GENTILE DA, an Italian painter, who flourished in the early part of the 15th century. He was born—it is not exactly known when—at Fabriano, and received his first instructions from his father, who appears to have been a man of superior culture, as he taught his son the elements of physics and mathematics. F.'s first teacher in art was, it is supposed, Allegrette de Nuzio. Subsequently, he went to Florence, and studied under Fiesole. Among his earliest works of note is a fresco of the Madonna in the cathedral of Orvieto. In 1423, he painted an "Adoration of the Kings" for the church of the Holy Trinity in Florence. This picture is one of the most admirable belonging to the school of Giotto. To the same period belongs a Madonna with saints (now in the Berlin museum). F. afterwards went to Venice, where he greatly increased his reputation by a picture of the bloody engagement between the fleet of the republic and that of the emperor Babarossa off the heights of Pirano. The Venetian senate was so delighted with the piece, that it conferred on the fortunate artist the dignity of a patrician, and a pension of a ducat *per diem* for life. Unhappily, this work has perished. Pope Martin V. now called F. to Rome, and employed him, along with Vittore Pisanello, in adorning the church of San Giovanni Laterano. As his share of the work, he painted various incidents in the life of John the Baptist, five prophets, and portraits of pope Martin himself and 10 cardinals. He died, while engaged on this building, some time after 1450. F.'s pictures indicate a cheerful and joyous nature. He had quite a child-like love of splendor and rich ornamentation, but is never extravagant or excessive in his coloring.

FABRI'CE, GEORG FRIEDRICH ALFRED VON, b. 1818; commander of the German army which occupied France in 1871. He was for a long time in the service of Saxony; was secretary of war in 1866, and reorganized the Saxon army after the Prussian plan. He showed admirable administrative ability as well as military genius.

FABRIC'IUS, CAIUS (FABRICIUS) LUSCINUS, a Roman gen., elected consul 282 B.C., and again in 280. He was sent, after the defeat of the Romans by Pyrrhus, to treat for the ransom and exchange of prisoners. Pyrrhus endeavored to bribe him, but all offers were rejected. At a later period, he made peace between the Romans and Pyrrhus.

FABRIC'IUS, or FABRIZIO, GIROLAMO, commonly named from his birthplace F. AB ACQUAPENDENTE, a celebrated anatomist and surgeon, was b. in 1537, and d. in 1619. He was the son of humble parents who, notwithstanding their poverty, sent him to the university of Padua, where, in addition to the usual instruction in the classics, he studied anatomy and surgery under the celebrated Fallopius with such success, that on the death of the latter in 1562, F. was appointed to fill the vacant professorship. He continued to hold this office for nearly half a century, during which period his high character for eloquence, general erudition, and professional knowledge, attracted students from all parts of the civilized world to the university of Padua. Amongst these students was our countryman Harvey (q.v.), who attended his prelections in 1598, and who, as will be seen in our notice of his life, derived from F.'s observations on the valves of the veins the first clue to his great discovery. He was a most laborious investigator of nature; and we find him comparing and contrasting the same organ in man, and in several of the lower animals, on a more methodical plan than had been attempted by any of his predecessors. In this way he treated of the eye, the larynx, the ear, the intestinal canal, the development of the fetus, and many other subjects. The improvements which his knowledge of anatomy enabled him to introduce into the practice of surgery were very great; and his *Opera Chirurgica*, which embraced every complaint curable by manual operation, was so highly valued, that it passed through seventeen editions. He was greatly esteemed by his fellow-citizens, for we find that the Venetian republic not only erected for him a spacious anatomical amphitheater, in which his name was inscribed, but at the same time conferred upon him an annual stipend of a thousand crowns, and created him a knight of the order of St. Mark. A few years before his death he retired with an ample fortune, from all professional duties, and died (some believe he was poisoned by his relatives) at the age of 82, in his ville on the banks of the Brenta, which still bears the name of the Montagnuola d'Acquapendente.

We have not space for a list of his numerous anatomical and surgical works. Upwards of a century after his death (in 1723), the celebrated anatomist Albinus collected and published a complete edition of all his anatomical and physiological works.

FABRIC'IUS, GEORG, 1516–71; b. Saxony; an archæologist. He made a minute examination of the antiquities of Rome, and wrote an elaborate work, so accurate in descriptions that many learned Germans believed it to be from the pen of some ancient writer. In 1553, he was appointed director of the college of Meissen, and held that office till his death.

FABRIC'IUS, JOANNES ALBERTUS, 1668–1736; b. Leipsic; a learned bibliographer. He stands pre-eminent among scholars for a series of literary catalogues entitled *Bibliotheca Latina*, *Bibliotheca Græca*, and *Bibliotheca Antiquaria*. He studied medicine, and afterwards theology; but most of his life was among books. A list of 128 of his works is given, of which, however, the greater part were merely edited.

FABRICIUS, JOH. CHRISTIAN, a Danish entomologist, b. at Tondern, Jan. 7, 1745, and d. at Kiel in 1807. He studied at Copenhagen, Edinburgh, Leyden, and Freyberg, and finally went to Upsala, to attend the classes of Linnæus. A warm friendship was cemented between master and pupil, and throughout his life F. was zealously employed in developing and applying the ideas and method of the great Swede. In 1775, F. was appointed to the chair of natural history at the university of Kiel, and from that time he devoted himself to the prosecution of his entomological studies, and to the fuller development of a system of classification of insects, based upon the structure of the mouth. Although his system has been found inapplicable to many families of insects, the observations on which it was based have tended materially to the extension of this branch of science. The *Systema Entomologiæ* (Copenh. 1775), in which F. expounded his views, constituted a new era in the history of entomology, while his *Genera Insectorum* (Kiel, 1776), *Mantissa Insectorum* (Copenh. 1787), and *Entomologia Systematica* (Copenh. 1792), opened hitherto unexplored fields of inquiry to the entomologist. F. was the author of several able treatises on the policy, statistics, and economy of Denmark, which were prepared by him in his capacity of councilor of state and prof. of rural and political economy at Kiel. F.'s death was said to have been hastened by the grief which he experienced in consequence of the political misfortunes of his country.

FABRO'NI, ANGELO, an excellent biographical writer, was b. at Marradi, in Tuscany, 7th Feb., 1732, educated at Faenza and Rome, and in 1773, was appointed tutor to the sons of Leopold, grand duke of Tuscany. He died 22d Sept., 1803. His *Vitæ Italorum Doctrina Excellentium qui Sæculo XVII. et XVIII. floruerunt* (20 vols., Pisa, 1778–1805), is one of the best Italian works of its kind, and contains quite a treasure of information; while his *Laurentii Medicei Vita* (2 vols., Pisa, 1784), and *Vita Magni Cosmi Medicei* (2 vols., Pisa, 1788–89), are reckoned model biographies.

FABYAN, or FABIAN, ROBERT, b. London, near the middle of the 15th c.; an English chronicler, alderman, and sheriff of London. His *Chronicle* extends from the time when "Brute enterd first the ile of Albion" to the year 1485. The chief value of the work is its details of city government and ceremonial.

FAÇADE (Fr.), the exterior front or face of a building. This term, although frequently restricted to classic architecture, may be applied to the front elevation of a building in any style. It is, however, generally used with reference to buildings of some magnitude and pretensions; thus, we speak of the *front* of a house, and the F. of a palace. The back elevation of an important building is called the rear F., in the same way as in England the back of a house is called the "*back front.*"

An edifice may have any number of façades when it shows a face or front in each direction. An elevation of the side of a building is called the *lateral* façade. The sides of a court or cortile are also called façades, and are distinguished as n., s., etc., façades.

FACCIOLA'TI, JACOPO, an Italian philologist and critic, was b. at Torreglia, not far from Padua, in 1682. He was educated in the religious seminary at Padua, where he became successively prof. of theology, prof. of philosophy, and superintendent-general of the classes, or rector of the institution. F. directed his attention chiefly to the revival of the study of ancient literature, and with this object, brought out a new edition of the *Lexicon Septem Linguarum*, called, from its original author, the monk Ambrosius of Calepio, the *Calepine Lexicon*. He was assisted in this work by his pupil, Forcellini, to whom is mainly owing the conception of a totally new Latin dictionary; an arduous undertaking, which F. continued till his death in 1769, and which was afterwards completed by Forcellini in 1771. F. and Forcellini, assisted by several others, likewise published a new edition of Nizoli's *Thesaurus Ciceronianus*. F.'s Latin epistles and orations are remarkable for the Ciceronian elegance of their style, and his notices on several philosophical writings of Cicero for their solidity, clearness, and taste.

FAC'ET, a term employed to denote the plane surfaces of crystals, or those artificially cut upon precious stones.

FACIAL ANGLE. See ANGLE.

FACIAL NERVE, the seventh cranial nerve in Sömmering's classification, originating in the medulla oblongata, passing through the temporal bone, and issuing from the skull through the stylomastoid foramen. It then branches over the superficial portions of the face, and acts as the muscle of expression. It was formerly classed as a portion of the seventh nerve, the *portio dura*, the other portion being the *portio mollis*, or auditory nerve; according to Sömmering, the 8th pair.

FACIAL NEURALGIA, paroxysmal pains in the head and face, caused by a morbid state of the nervous center, which may be the result of lack of nutrition, of blood-poisoning, or of hereditary predisposition. It may also be caused by irritation from bad teeth, and by inflammation of the facial nerve.

FACIAL PARALYSIS, a paralysis of the facial nerve on which depends the power to move the muscles of the face. One or both sides of the face may be thus affected, and the attack is quite certain to be attended with a partial or entire loss of the power of articulation.

FACILITY, in the legal terminology of Scotland, is a condition of mental weakness short of that which will justify *cognition* (q.v.), but which calls for the protection of the law, which is exercised by means of a process called interdiction (q.v.). The object of interdiction is to prevent the facile person from granting deeds to his own prejudice, and after its has taken place, he cannot contract without the consent of his interdictors. Even without interdiction, the deeds of a facile person, if to his prejudice, may be set aside, if there be proof of his having been circumvented or imposed on; and Erskine says that "where lesion in the deed, and facility in the granter concur, the most slender circumstances of fraud or circumvention are sufficient to set a deed aside."—B. iv. tit. 1, s. 27. See FRAUD, LESION, INSANITY. There is no corresponding term in English law, and the remedy of interdiction is unknown, but weakness of mind approaching to idiocy will, of course, form an important element in proving fraud.

FACTOR, in mathematics. The numbers 6 and 4, multiplied together, *make* 24; hence 6 and 4 are called *factors* of the product 24. Most numbers are products of two or more factors; thus $10=2\times5$; $12=3\times4$, or 2×6, or $2\times2\times3$. Every product can be divided by any of its factors without remainder; a factor, therefore, is often called a *divisor*, or measure. 2, 3, 4, 6, 8, 12, are all factors or divisors of 24. Numbers that have no factor or divisor above unity, such as 2, 3, 5, 7, 11, . . . 23, etc., are called *prime* numbers. See NUMBERS, THEORY OF.

FACTOR, in its most general sense, is the term applied to any one whc is employed to do business for another. Factory differs from the mandate of the Roman law in not being gratuitous. In mercantile transactions, the sale of goods is generally effected either by factors or brokers, both of whom are agents, remunerated generally by a commission. But the powers of factors are higher than those of brokers, inasmuch as the former are intrusted with the possession of the goods, and authorized to sell them as if they were their own; whereas the latter have no possession or apparent ownership, but act not only really but ostensibly as agents. Factors frequently act on the principle of the *del credere commission* (q.v.), receiving, that is to say, a higher remuneration in consideration of undertaking to guarantee the solvency of the purchasers. At common law, a sale or other transaction by a F. was bad, if it was not fully warranted by the nature of the authority which he derived from his principal; but this doctrine has been modified by several statutes which have been passed for the protection of strangers dealing with persons intrusted with the possession of goods, the extent of whose authority they had no means of ascertaining. By 6 Geo. IV. c. 94, called the factors' act, it was provided that any person in possession of a bill of lading is to be deemed the true owner of the goods therein described, so far as to give validity to any contract or agreement made with him regarding them. 7 and 8 Geo. IV. enacts that if any F. shall, for his own benefit, and in violation of good faith, deposit or pledge any goods, or order for their delivery, he shall be guilty of a misdemeanor. In 1842, the powers of 6 Geo. IV. c. 94, were defined and extended by 5 and 6 Vict. c. 39, which enacted that *bonâ fide* advances to persons intrusted with the possession of goods or documents of title, though known to be agents, should be protected; *bonâ fide* deposits in exchange were also protected, but it was provided that there should be no lien beyond the value of the goods given up. The agent's responsibility to his principal is not diminished, but it is provided that if he shall make consignments contrary to the instructions of his principal, he shall be guilty of a misdemeanor.

In Scotland, the term factor is applied to an agent managing heritable estates for another, letting farms, drawing rents, and the like, in which sense it is nearly synonymous with the English *steward*, a term which, in Scotland, again, is employed to denote an agent whose powers are of a far more limited kind than those of a F., and who generally acts under him. If a F. pay money into a bank on his own account, he takes the risk of the bank's failure. A F. cannot delegate his powers, but he may employ a third party to aid him in their discharge. He binds his principal to any engagement which he contracts within his powers. Factory may be recalled, and falls by the death of the principal; but actions already begun may go on, and those done in ignorance of the revocation or death are binding. Revocation is implied in the appoint-

ment of a new agent to do the same act. The mandate of factory subsists notwithstanding the supervening insanity of the mandant. Factors may be empowered to grant leases and pursue removings, but for these acts special powers are required. Writers to the signet in Edinburgh, and writers in country towns, frequently act as factors for the neighboring landed proprietors. In 1877, an act was passed to remove doubts and amend the previous factors acts (1823–77). See AGENT; JUDICIAL FACTOR.

FACTOR (*ante*), a man employed to sell the goods of another; in the United States usually called a commission merchant, because he has his compensation in a commission or percentage upon the goods he sells. He differs from a broker in that he has actual possession of the goods of his principal, and is empowered to deliver them to the purchaser precisely as if they were his own. He generally buys and sells in his own name, so that those dealing with him may not know whether he is owner or factor. Under some limitations for self-protection, he is bound by the instructions of his principal and responsible for damages arising from a violation thereof. A factor is entitled to his commissions only after he has rendered the full service by which they were to be earned. He is responsible to his principal for losses incurred by want of ordinary care and skill in the transaction of business. In the absence of particular instructions he must follow the established rules and methods of the business in which he is engaged. He cannot delegate his authority without express permission of his principal, except in conformity to general usage or by stress of peculiar circumstances. His discretion is large, but he is bound to use it with due regard to the interest of his principal. He cannot sell goods at a sacrifice for the purpose of obtaining his commissions and advances. It is generally held in the United States that a factor who has made advances upon goods acquires such an interest in them that the principal cannot take them out of his possession by a revocation of his authority. The latter can sell enough of them to reimburse himself, the principal having power over the remainder. In many American states, a factor is deemed to be the true owner in the sense that sales made by him to purchasers acting in good faith are valid. Generally he acts under what is called a "guarantee," or "commission," i.e., a commission received as a consideration for guaranteeing to the principal payment for the goods which he sells. A factor whose principal resides in a foreign country stands to purchasers, in most respects, in the relation of an absolute owner. If a factor commits any wrongful act in a sale, the principal has the right to recover his goods wherever he can trace them, unless they are in possession of one who purchased them in good faith.

FACTORIES are establishments where large numbers of persons co-operate in the production of some article of consumption, the principle of the division of labor being in all cases applied, and generally machinery to a greater or less extent. The factory system is opposed to the practice of individual labor at the homes of the artisans. Every production of art requires a longer or shorter series of operations, often varying considerably in their nature. The hand-worker performs most of these himself; one and the same person makes the complete article. In a factory, every article goes through as many hands or machines as there are separate processes required; each workman performs only one, and that always the same, process. The chief advantages of this way of proceeding are the following: Loss of time is avoided in passing from one operation to another, a loss which is the greater, the greater the difference in the nature of the operation. The workman, confined to one thing, in itself usually simple, not only learns it sooner, but attains a quickness and skill that one distracted with a variety of operations can never attain; besides, the constant occupation with one kind of work leads the workman to light upon improvements in tools and machines so as to increase their rapidity of execution and their precision. As only few of the processes are very difficult, it is possible to turn to some account less skillful workmen, and even children, and to assign to each person that kind of work at which he is most effective. All parts of the work, too, that are quite uniform in the case of each article, can generally be done by machinery. Lastly, in F., there is more opportunity of turning to advantage all kinds of refuse.

A necessary consequence of these advantages is, that the cost of production is less on the factory system than in the other way; and more than that, the articles themselves, when of a nature adapted to this mode of production, are better, and of a uniformity otherwise unattainable. Wherever a comparatively homogeneous material has to be made into a large number of uniform articles, there the factory system is in its proper place. The best examples are spinning, weaving, cloth-printing, pin and needle making, etc. But even in the manufacture of complex articles composed of different kinds of material, the factory system may be pursued with advantage whenever the number of the articles required is great, and the separate parts of such a kind that a great number can be made exactly alike. This is the case with watches, weapons, locks, etc. Such a manufacture divides itself into as many separate employments as there are parts in each article, and the putting together and adjusting forms another. The degree of complexity is carried still further in such cases as the manufacture of carriages, where operations of the most heterogeneous kind have to concur. In some cases, F. do not concern themselves with the putting together of the parts, but merely produce them for hand-workers and special professionists, as is the case in watch-mak-

ing. In making clothes and shoes and the like, where each individual article requires special adaptation, factory work is not so suitable. How far it is advisable in any case to employ machinery, depends on the nature of the work, the cost of the machinery, the scale on which operations are to be carried on, etc. Nowhere have the factory system and the employment of machinery been carried further than in America. In Cincinnati, for instance, one establishment has produced 200 doz. chairs a week, another 1000 bedsteads, most of the work being done by machinery; and one boot and shoe factory has used 600 bushels of shoe-pegs. Even the killing of pigs is done on this grand scale; one firm at Chicago killing and packing 373,725 hogs in four months.—F. cannot succeed in great numbers except in localities where the population is sufficiently dense to afford a sufficient choice of hands, and also to cause a comparatively low rate of wages. Other conditions of a good locality for factory production are abundance of water-power or the presence of coal for steam power, nearness to the raw material, and good communications.

While the rise and extension of the factory system, when looked at from the point of view of material economics, must be pronounced a decided improvement, it cannot be denied that, socially and politically considered, it has its dark side. The greater the capital and the training necessary for carrying on an extensive establishment, the less prospect the workman has of ever raising himself to independence. The chasm that separates the mill-owner from his dependants is infinitely greater than that which exists between a master artisan and his journeymen. The hope of gradual advancement afforded in the last case supplies a powerful moral support and means of discipline; the impassible gulf in the other acts as a stumbling-block and temptation. Factory-workers are especially disposed to enter heedlessly into marriage, as they require to make no provision for a workshop, tools, and other outlay once necessary for entering life; while they have the prospect of the wife, and soon of the children, as contributors to the support of the family. It may, at all events, be affirmed, that the increase and accumulation in masses of the class called *proletaires*, who have no provision for a week but the labor of that week, is favored by the factory system. Moreover, the employment of wife and child as fellow-laborers endangers the old and sacred bonds of the family; the father can no longer remain, to the extent that he ought to be, master of the house of which he is no longer the sole support; and how much the family affection is thus weakened, is painfully exhibited in the ill-treatment of the younger children, who are prematurely put to labor, and literally robbed of their childhood. At the same time, it cannot be allowed that these evils are incapable of remedy; legislation and public opinion can here do much; nor must it be forgotten that the evil is not peculiar to factory labor, but is a feature of the whole of our more recent industrial economics. The greatest abuses of the kind in England are found in the mining districts, and among the small domestic manufacturers. The very circumstances that give rise to the evils afford the means of obviating them, if they were only taken advantage of; for, the larger the establishment, the more good can an owner do for his people, and the less it is possible to conceal abuses. It cannot with justice be charged against factory labor that in itself it has a demoralizing tendency. Whatever brings together numbers of human beings increases, no doubt, opportunities and temptations to aberrations, especially in the intercourse of the sexes; but not more so in the case of a factory than in that of all large towns, and even less so than in some other cases of assemblage, as armies and garrisons.

FACTORY ACTS. From motives of humanity, several statutes have been passed in recent years for regulating the hours of work, preserving the health, and promoting the education of young persons employed in mills and factories. The leading act is 7 and 8 Vict. c. 15; though much had already been done by the old statute 42 Geo. III. c. 73, and by 3 and 4 Will. IV. c. 103, commonly called the factory act, amended by 4 Will. IV. c. 1. By these ast-mentioned acts, night-work—that is, between half-past eight in the evening and half-past five in the morning—was, with some exceptions, forbidden in the case of persons under 18 years of age; whilst their hours of labor were limited to 12 in the day, including one and a half hours for meals. The employment of children under 9 was prohibited, except in silk-mills; and under 13 the hours were restricted to eight a day, or ten in silk-mills. Holidays were allowed, and certificates of health required from a surgeon or physician previous to the admission of a child into a factory, under certain penalties. By 3 and 4 Will. IV. c. 103, also, inspectors of factories were appointed, and their powers and duties for its enforcement defined. Amongst the duties of the inspector was included that of seeing that every child within the restricted age was placed at school; and in case of the parents or guardians of the child omitting to provide for his education, to order the employer to pay to him (the inspector) one penny in every shilling of the weekly wages of the child, to be applied to that purpose. By 7 and 8 Vict. c. 15, the powers and duties of inspectors were more accurately set forth. Regulations are laid down for the protection of children working in web-spinning flax-mills, and it is enacted that the mill-gearing shall not be cleaned while in motion, and that the machinery shall be guarded. A child is defined to mean a person under 13; and a young person, one between the ages of 13 and 18. An abstract of the act and relative notices must be hung up in every factory. As to the time of children's

work, it is provided that they shall not be employed more than six hours and 30 minutes in any one day, or seven in silk factories; but they may be employed ten hours in one day on three alternate days of the week, provided that they be not employed in any manner in the same, or any other factory, on two successive days, or after half-past four on a Saturday. On the vacant days, the children are to be sent to school for five hours, provided the day be not a Saturday, when no school attendance of any child shall be required. Women above the age of 18 are to be employed as young persons; and work for all children and young persons is to cease on Saturday at half-past four. In addition to the regulations of the former act, it is provided regarding meal-times, that the hours allowed shall be between half-past seven in the morning, and half-past seven in the evening, and that one hour shall be before three o'clock. No child or young person shall be employed more than five hours before one o'clock without an interval for meal-time of at least 30 minutes. All young persons are to have their meal-times at the same hour, and are not to be allowed to remain in any of the rooms used for manufacturing processes. Eight half-holidays are to be given in every factory, in addition to Good-Friday and Christmas-day, and the sacramental fast-day in Scotch parishes. By the subsequent act, 16 and 17 Vict. c. 102, it is required that no person under 13 shall be employed in a factory before six o'clock in the morning or after six in the evening; or on Saturday after two o'clock; but between Sept. 30 and April 1, children may for one month be employed on any day but Saturday from seven in the morning till seven in the evening. By 8 and 9 Vict. c. 29, the powers of inspectors and the regulations in respect to the employment of women and children, are extended to calico-works; and rope-works are expressly exempted from them by 9 and 10 Vict. c. 40. By 10 Vict. c. 29, the hours of labor for young persons, and women above the age of 18, are reduced from 12, which the factory act had fixed, to 10, after 1st May, 1848; and by 13 and 14 Vict. c. 37, it is enacted that the same persons shall not be employed before six in the morning or after six in the evening, or after two o'clock on a Saturday. Meal-times must be between half-past seven in the morning and six in the evening. By 13 and 14 Vict. c. 37, children above 11 are to be viewed as young persons when employed in winding and throwing silk. 19 and 20 Vict. c. 38, limits the provisions of 7 and 8 Vict. c. 15, as to mill-gearing, to those parts with which children and young persons and women are liable to come in contact. By subsequent legislation, the provisions of the acts have been modified and extended. See WORKSHOP REGULATION ACT.

FACTORY ACTS. In 1876, the royal commission on factory and workshop acts reported that previous legislation had been to a large extent successful; and that, while some occupations were still undoubtedly unhealthy in spite of the sanitary regulations of these acts, the cases in which young children were employed in labor unfitted for their years, or in which young persons and women suffered physically from overwork, had become uncommon. The commissioners, however, proposed large changes in the law, and in particular they proposed the consolidation of the law, which was then dispersed through fifteen statutes, one of them, passed in the year 1802, requiring all apprentices in cotton and woolen factories to be instructed in the principles of the Christian religion. This has been accomplished by the factory and workshop act, 1878, 41 Vict. c. 16, which deals with five classes of works: (1) Textile factories, which remain very much under the regulations enacted by the factory acts of 1844, 1861, and 1874: (2) Non-textile factories, which include the occupations enumerated in the factory acts extension act, 1864, and the workshops act, 1867, whether using mechanical power or not, and also all occupations, not named in these acts, in which mechanical power is used: (3) Workshops, or all unnamed occupations, in which mechanical power is not used, except those named in the acts of 1864 and 1867: (4) Workshops in which none but women above the age of eighteen are employed: (5) Domestic workshops, in which the work is carried on in a private house, room, or place in which the only persons employed are members of the same family dwelling there. In class (1), where power is used, and the large majority of workers are women and children, the highest degree of regulation is reached. In class (2), where the labor is not so hard, or the strain of attendance on the moving power not so heavy, the statutory hours of work are somewhat relaxed, but education and sanitary provisions are still compulsory. In class (3), registers of children and young persons, and certificates of age and fitness, are, except in special circumstances, dispensed with. In class (4), the hours for work and meals may be changed, and the sanitary authority is responsible for the sanitary state of the shop. In class (5), there is still greater elasticity as regards hours for work and meals; the medical officer of health inspects the sanitary condition, but the employment of women is entirely unrestricted. The chief textile factories are those for the manufacture of cotton, wool, hair, silk, flax, hemp, jute, tow, China-grass, cocoa-nut fiber, or similar materials, either separately or in combination, or of any fabric made from these materials. The chief non-textile factories are print works, bleaching and dyeing works, earthenware works, lucifer-match, percussion-cap, and cartridge works, paper-staining works, fustian-cutting works, blast-furnaces, copper and iron mills, foundries of all kinds, metal and india-rubber works, paper-mills (including mills for converting cotton-waste into half-stuff), glass works, tobacco factories, letter-press printing works, book-binding works, and flax scutch-mills. The expression non-textile factory also includes

any premises in which manual labor is exercised in making, repairing, altering, ornamenting, or adapting for sale any article, and in which the manufacturing process is assisted by mechanical power. A workshop, again, is any premises, room, or place where manual labor is exercised for these purposes, and to which the employer of the persons working there has the right of access, or over which he has a right of control. The following premises or places are considered to be non-textile factories, if they have mechanical power to aid the manufacturing process; workshops, if they have not—namely, hat works, rope works (where mechanical power is not used to draw and spin the fibers), bakehouses, lace warehouses (where the process is entirely subsequent to the making of lace on a lace machine), ship-building yards, quarries, and pit-banks (not under the restrictions of the coal mines regulation act). A place used solely as a dwelling, a part of a factory used solely for some purpose different from the process carried on in the factory, and a school, are not considered to be workshops or factories. Straw-plaiting, pillow lace-making, glove-making, and some other handicrafts of a light character, may be carried on by a family in a private house or room, without fixing on the premises the legal liability of a workshop. Again, if the manual labor is exercised only at irregular intervals, and does not furnish the principal means of living to the family, the house will not become a workshop. The act does not apply to persons merely engaged to repair machinery in a factory.

In considering the main provisions of the act of 1878, it must be kept in view that a "factory" means a place in which machinery is moved by the aid of steam, water, or other mechanical power; a "child" means a person under the age of 14 years; a "young person" means a person between 14 and 18 years of age; a "woman" means a woman of 18 years and upwards; "parent" includes the person having the custody or control of any child; "night" means the period between 9 P.M. and 6 A.M. The general *sanitary provision* applicable to all factories and workshops is, that they shall be clean, free from effluvia, not overcrowded, and ventilated so as to render harmless, so far as practicable, the gases, vapors, dust, etc., which are generated in the process and are injurious to health. Where anything is wrong, the factory inspector gives notice to the sanitary (local) authority. Every factory is to be lime-washed once in 14 months, unless painted in oil once in 7 years, when it must be washed once in 14 months. The inspector may order fans to be used where dust is generated by grinding, glazing, or polishing on a wheel. Special provision is made for the painting of bakehouses, and for the protection of workers in the wet-spinning process. The obligation to fence factory machinery in an efficient manner applies to every hoist or teagle near to which any person is liable to be employed, every fly-wheel connected with mechanical power, every part of a steam-engine and water-wheel, and every wheel-race. The inspector may also require the fencing of any driving-strap, or band, or other part of machinery which he considers dangerous, or of any vat, pan, or other structure filled with hot liquid or molten metal so as to be a likely source of danger to the protected classes. Children must not be set to clean any part of the machinery while in motion; as regards young persons and women, the prohibition extends only to mill-gearing. No work is to be done between the fixed and traversing parts of a self-acting machine while moved by mechanical power. The general rules for the employment of young persons and women in textile factories are 6 A.M. to 6 P.M., or 7 A.M. to 7 P.M., except on Saturdays, and on Saturdays 6 A.M. to 12.30 or 1 P.M. (according to the time allowed for meals), or 7 A.M. to 1.30 P.M. Two hours (one of them before 3 P.M.) must be allowed for meals on every day except Saturday, on which half an hour is sufficient. The employment is not to be continuous for more than 4½ hours without an interval of half an hour for meals. The variations on these rules for young persons and women in a non-textile factory, and for young persons in a workshop, are that the minimum time for meals is reduced to 1½ hour, and the period of continuous employment is extended to 5 hours. As regards children in textile factories, they must be employed on the system of morning and afternoon sets, or on that of alternate days. Their morning set ends at 1 P.M., or dinner-time, if that is earlier; the afternoon set begins at 1 P.M., or after dinner, if that is later. The Saturday hours for children are the same as for others. Neither set is to be continued more than seven days, and no child may be employed on two successive Saturdays. Under the alternate day system, the hours for employment and meals are the same as for young persons. In workshops in which neither children nor young persons are employed, the hours for women are 6 A.M. to 9 P.M., with 4½ hours for meals and absence for work; and on Saturdays, 6 A.M. to 4 P.M., with 2½ hours for these purposes. As regards *domestic* workshops, the most important specialty is that the alternate system for children may not be used. The actual times for work and meals are not fixed, but overtime is prohibited, and the shops remain under the sanitary supervision of the local authority. The two points fixed by statute with reference to meals in factories and workshops generally are: That the three classes of children, young persons, and women must have their meals at the same hour; that during that hour none of them is allowed to remain in a room where the manufacturing process is being carried on. In every factory and workshop the period of employment, prohibitions, meal-hours, and system of children's labor, must all be published in a notice put up within the premises. Employment of children under ten, and of any of the protected classes on Sunday, is prohibited. The occupier is also bound to give eight half

holidays in every year, besides (in Scotland) the sacramental fasts. In trades carried on in connection with the retail business, the home secretary may authorize the giving of separate holidays to different classes of workers; and in other cases (e.g., in provincial towns where Saturday is the market-day) he may substitute another week-day for the Saturday half-holiday. A child, employed on the morning and afternoon set, must give one school attendance on each work day, and, if employed on the alternate day system, two attendances on each non-working day. The penalty is that the child cannot be employed in the following week before the deficiency in attendances has been made up. It is the duty of the employer to get every week from the teacher a certificate of attendance. He may also be obliged to pay to the school-manager a sum not exceeding 3*d.* a week, or one twelfth part of the child's weekly wages. A child of 13, however, on obtaining a certificate of proficiency, will be treated as a young person. No child or young person under the age of 16, is to be employed in a factory for more than seven days without a certificate of age and physical fitness granted after personal examination by the medical officer or certifying surgeon of the district. When an accident occurs in a factory or workshop which causes loss of life, or prevents the person injured resuming work within 48 hours, notice must be given to the inspector and the medical officer or certifying surgeon, the latter of whom must go at once to the premises and report to the inspector on the nature and cause of the death or injury.

It is impossible to mention all the special restrictions which the act imposes. For instance, no children or young persons are allowed to work at silvering mirrors by the mercurial process, making white lead, melting or annealing glass. Children must not be employed in dipping lucifer matches, or dry grinding in the metal trade. Girls must not be employed in making or finishing bricks or salt. In glass and earthenware works and others, certain parts of the works must not be used for taking meals. The home secretary has power to extend such restrictions to other unwholesome occupations. Again, where the customs and exigences of a trade require it, the home secretary may alter the hours of labor to 8 A.M. and 8 P.M., or even 9 A.M. and 9 P.M. Of the first class, lithographic printing, envelope making, biscuit making, and bookbinding are examples; of the second, the straw-hat making at Luton, and warehouses in London and elsewhere.

The administration of the act is carried on by inspectors, appointed and paid by government. They have large powers of entering factories, workshops, and schools, of asking for documents, of examining persons on oath. A special warrant is required to enter a dwelling-house. The inspectors report to government annually. The certifying surgeons appointed by the inspectors are entitled to charge for their statutory duties certain fees, which are paid by the employer, but which he may deduct from wages.

FACTORY ACTS (*ante*), laws enacted for the protection of persons working in factories, limiting the hours of labor, limiting the age at which children are permitted to engage in such work, and requiring them to have a certain amount of school instruction. Legislation of this kind in states where factories abound has been deemed necessary for moral and sanitary reasons.

FACULÆ (Lat. *facula*, a torch), in astronomy, are spots, brighter than the rest of the surface, which are sometimes seen on the sun's disk. See SUN.

FACULTIES, COURT OF, a court established by 25 Hen. VIII. c. 21, s. 4, whereby authority is given to the archbishop of Canterbury and his successors to grant dispensations, faculties, etc., by himself, or his sufficient and substantial commissary or deputy, for any such matters not being repugnant to the holy Scriptures and the laws of God, whereof before such dispensations, etc., had been accustomed to be had at the see of Rome. Up to the time of passing this act, the pope, notwithstanding the statutes which had been passed restraining his authority, continued to exercise his power, and to draw a considerable revenue for indulgences, etc. The chief officer of the court is called *magister ad facultates*. The sittings of the court have always been held at Doctors Commons (q.v.). On its first institution, there were various matters in which the dispensing power was called into exercise—such as the power to hold two or more livings (see PLURALISM), and the permission to eat flesh in Lent, etc. But of late years the matter which has chiefly occupied the court has been the granting license to marry without publication of banns. See LICENSE, MARRIAGE, DISPENSATION.

FACULTY. See UNIVERSITY.

FACULTY, a name applied to certain aptitudes or powers of the mind, especially those of the intellect. Reid considered that the characteristic of a faculty was its *primitive* character, as opposed to the acquired powers, or habits. Sir W. Hamilton remarks on this distinction as follows: "Powers are *active* and *passive*, *natural* and *acquired*. Powers natural and active are called *faculties*. Powers natural and passive, *capacities* or *receptivities*. Powers acquired are habits, and habit is used both in an active and passive sense."—Reid, p. 221. Hence, in discussing the intellect, whatever are considered its primary or fundamental functions, are its faculties. Perception, memory, reasoning, imagination, are the leading intellectual faculties, according to the older metaphysicians, who followed the popular classification. These would not now be con-

sidered as giving the ultimate analysis of the intellect. Conscience, or the moral sense, has sometimes been called the *moral* faculty. See INTELLECT.

FACULTY, GRANT OF, BY THE ORDINARY, an order by the bishop of a diocese to award some privilege not permitted by common law. A faculty is necessary in order to effect any important alteration in a church, such as the erection of a gallery or of an organ. Without a faculty, a person is not entitled to erect a monument within the walls of a church. But a monument having been put up, though without a faculty, cannot be removed till a faculty or order to that effect has been obtained. By the common law of England, every parishioner is entitled to a seat in church, but no one has a claim to any particular seat, unless the right has been given by a faculty. See PEWS.

FACULTY OF ADVOCATES. See ADVOCATES.

FÆCES, or SOLID EXCREMENTS, are the matters which an animal ejects from the lower end of the intestinal canal, and in greater part, consist of those portions of food which, on passing through the alimentary canal, have been rejected as comparatively worthless in the office of nutrition. In the higher animals, the F. generally contain about three fourths of their weight of water, the remaining one fourth consisting, in greater part, of organic remains; in the case of the ox, sheep, and other herbivorous animals, of undigested woody fiber. In the human subject, the quantity of F. yielded daily by an average healthy man is 5 to 6 ozs.; the peculiar brown color is due to the presence of decomposing biliary matter, and the odor to partially changed nitrogenous substances resembling casein. The following table gives the composition of human and ox fæces:

HUMAN.		OX.	
Water	73.3	Water	70.00
Organic remains	7.0	Woody fiber	22.50
Biliary and nitrogenous matter	14.9	Wax	0.76
Albumen	0.9	Sugar	3.00
Extract	2.7	Albumen	2.00
Salts	1.2	Resin and salts	1.74

For use as manure, these F. are of little value as compared with guano, dissolved bones, or superphosphates, and, indeed, the principal effete matters of importance to the agriculturist are resident in the urine or liquid excrement of the higher animals. In the case, however, of birds and reptiles, the urine and F. are voided together more or less moist, and hence the richness of such excrementitious matter, and its high agricultural value. See GUANO. The following table gives the composition of the F. of the boa constrictor:

Uric acid	90.16
Ammonia	1.70
Potash	3.45
Sulphate of potash	0.95
Phosphate of lime, etc.	0.80
Mucus and coloring matter	2.94
	100.00

FAED, JOHN, a popular Scottish painter, was b. in 1820 at Burley Mill, in the stewartry of Kirkcudbright where his father was an engineer and millwright. His love of art was manifested at an early period, and when hardly entered on his teens, he was in the habit of making tours through the villages of Galloway, painting miniatures. In 1841, he came to Edinburgh, where his talents ultimately won him a high reputation. The first picture of F.'s that obtained great popularity was "The Cruel Sisters" (1851). Since then, F. has executed, among other works, "Shakespeare and his Contemporaries," "The Cotter's Saturday Night," and "The Soldier's Return;" and, since coming to London in 1864, "The Wappenschaw," "The Old Style," "Tam o' Shanter," "Haddon Hall of Old," "The Stirrup Cup," "John Anderson my Jo," "The Gamekeeper's Daughter," and "The Hiring Fair."

FAED, THOMAS, brother of the preceding, was b. at Burley Mill in 1826, and has also followed the career of an artist. One of his earliest efforts was a drawing (in water-colors) from the *Old English Baron.* In 1849, he became an associate of the royal Scottish academy, and shortly after executed a very attractive work, entitled "Scott and his Friends at Abbotsford." In 1852, he removed to London, where his "Mitherless Bairn," exhibited in 1855, was declared by the critics to be "the picture of the season." Of his subsequent works, we need only mention "Home and the Homeless," "The First Break in the Family," "Sunday in the Backwoods," "From Dawn to Sunset," "Baith Faither and Mither," and "The Last o' the Clan." F. was made A.R.A. in 1859, R.A. in 1864, and elected an honorary member of the Vienna royal academy in 1875.

FAEN'ZA, a t. of Italy, 20 m. S.W. of Ravenna, is on the left bank of the Lamone, in a beautiful plain. It is built in the form of a square divided by four great streets,

which meet in the center. Among the chief buildings are an imposing cathedral, a fine market-place surrounded with arcades and adorned with a fountain, and numerous palaces and ecclesiastical edifices. Its manufacture of glazed and colored earthenware vessels, in Italy called "majolica," and in France "faience" (q.v.), has declined in importance, and its chief industry now is the making of silk, linen, and paper. Pop. '72, 36,299.

F., the ancient *Faventia*, was at one period a town of the Boii, was afterwards a *municipium* under the Romans, and was annexed to the states of the church in the 15th c. by pope Alexander VI., in which condition it remained till 1860, when, with the Emilian provinces, it was annexed to the kingdom of Italy under Victor Emmanuel.

FÆSULÆ. See FIESOLE, *ante*.

FAGGING is the name given to a usage peculiar to the great public schools of England, the nature of which will be presently described. The origin of the practice cannot be traced. No school statutes refer to it, no school traditions speak of a time when it was not. The statutes of Eton college rather indicate precaution against it, for they ordain that there be thirteen poor youths in the establishment to work for the college; but in Edward IV.'s time the college was much impoverished by royal depredations—the fellowships were cut down from ten to seven, and these *pauperes juniores* abolished. However, be the origin what it may, the institution, as we have said, exists, and in very nearly the same form, in all the public schools—that is to say, Eton, Harrow, Westminster, Winchester, and Rugby. Its main features are in every case much as follows: In each school there are two limits: the upper limit extending to the bottom of the first one or two forms (the public school designation of classes), below which a boy may not fag; and the lower limit, comprising the last four or five of the lowest forms, above which a boy may not be fagged. The boys between these limits, as also those who, although comprised within the lower limit, have been more than a certain time in the school, are devoid alike of rights and duties in connection with this practice. The services of a fag are of two kinds—the one comprising his duties to a special master, to whom he has been assigned; the other consisting of those due to the whole of the upper boys. The former comprise such tasks as preparing his master's breakfast, stoking his master's fire, carrying his master's messages, and smuggling into the house little forbidden delicacies for his master's consumption, and in this instance, if detected, bearing his master's punishment. Those services which a lower boy owes to the whole of the upper boys, consist of attendance at the games. In the cricket season, the fags perform the functions of a net, and stand behind the wickets to stop the balls while their seniors are practicing; and at all seasons they are liable to the drearier task of waiting attendance on the racket-players, and retrieving the balls which have been "skyed" out of the court. All cases of difficulty arising out of fagging are within the jurisdiction of the head-boy in the house, or the head of the school, and are settled by reference to him. Such are the main features of F. at the present day—the idea pervading the institution being, that no boy should be liable to the performance of any duties really menial, but only such as, in the absence of the practice, would naturally be performed by each boy for himself. Many of the abuses of this practice, which have from time to time been discovered and suppressed, afford whimsical illustrations of the peccant ingenuity of boy-nature. In one school, a senior boy once had a study, but was not studious; he might have let it out to a younger boy in want of a crib to read in at a rent of some five or ten shillings a term, but his mind soared beyond such paltry dealings; he conceived vaster and grander ideas of the management of his property: he set up a tap. He smuggled into his room a nine-gallon cask, called a "governo." There was a rapid succession of governors, and a brisk demand for beer; so he appointed his fag, a fine stout lad, as deputy-tapster to receive the coppers. The deputy grew attached to both his governors, and flourished long and happily in the faithful discharge of his duties. Another instance consisted of an equally whimsical and widely different exercise of power. A sixth-form boy, of high-church principles, made his fags, two very nice well-conditioned young scholars, get up early and come to his room every morning before school for prayers.

So prominent a feature in the constitution of English public schools as the institution of F., has, of course, received much criticism from educational reformers. The well-known author of the letters from Paterfamilias to the *Cornhill Magazine*, himself an Etonian, and one of those rare instances of a public-school man dissatisfied with the recollections of his school-life, speaks of the practice with the greatest bitterness. "Fagging," says he, "now happily almost obsolete, was also based upon the breeches-pocket question. I used often to doubt, when called off from my studies, whilst a lower boy at Harchester, to mend my master's fire, to prepare his meals, or to brush his clothes, whether a system which permitted and upheld such practices could really be beneficial to him or to me: but I never had any doubt that it was very beneficial to our tutor, inasmuch as it spared him the wages of some two or three servants, whose menial work was performed by the lower boys. Of course, the ingenuity of our masters discovered plenty of excellent arguments in support of practices so convenient to themselves; our parents used to be told that carrying coals for the upper boys, and toasting their muffins, made us helpful and docile, and took the nonsense out of bumptious lads; but such arguments would have applied just as aptly towards establishing the propriety

of setting young noblemen and gentlemen to assist the scullion, or to sort out the dirty linen for the wash." These are certainly sharp words, but doubtless many persons may be found to sympathize with a great deal of the censure contained in them. They will tell us that much vigilance is necessary to prevent the abuse of the power of exacting casual service on the part of the senior boys, and that the rules of F., such as they are, give no adequate security against serious vexation and waste of a small boy's time. They say that the favorite apology, on the ground of its taking the conceit out of those who have been spoiled at home, is fallacious; that football and parsing are sufficient curatives of this evil tone of mind; and that if the necessity to render service to a senior takes the conceit out, the subsequent privilege of the early exercise of power only too rapidly pours it in again. They deny, also, the validity of one very favorite assertion of the upholders of the system, that the relation between master and fag often, and indeed generally, gives rise to very pleasant intimacies between the upper and lower boys, and intimacies very beneficial to the latter. On the contrary, they maintain that no case of attachment between master and fag can be pointed to which would not have existed under any circumstances, and that this relation may often be found to have marred what would otherwise have been a very friendly recollection. The advocates of the system tells us, on the other hand, that the attendant evils are greatly exaggerated, and in some cases purely fictitious, while it is in many respects of very great, if not essential, service to the existence of a public school. They deny that it has been originated and upheld by the tutors from purely commercial considerations, as asserted by Paterfamilias; for, as has been already said, no really menial services are exacted of any boy, but only such as each boy might reasonably be expected to perform for himself, inasmuch as, in point of fact, many men at the university—not choosing or not being able to afford a gyp—do really prepare their own breakfast, stoke their own fires, and go on their own errands. That while abuses do occasionally occur, everything is against the probability of their frequency or extent, as the utmost facility exists on the part of the juniors for bringing their grievances before the proper authorities, and obtaining speedy redress. They say that, as a fact, the services of a fag are so light that he does not care or think about them, and they appeal in support of this statement to the tone in which the boys themselves are in the habit of referring to the subject. See the *Etonian*, a periodical published by some Eton boys 30 or 40 years ago; and the *Triumvirate*, a similar and more modern periodical from Harrow school. But the principal argument in the defense of the system must always rest, its supporters tell us, upon the security afforded by it against bullying. In public schools, where the ages of the boys vary from 10 to 20, a much greater liberty is given to the boys, and much greater confidence is reposed in them than in private schools—the idea being, that their characters can only be truly formed by as unrestricted intercourse as possible among themselves, not hampered by the constant presence of a superior. This constant presence of a master is, therefore, replaced by the traditions and constitution of the school, in which each boy has his assigned position, and his definite rights and duties; a constitution, therefore, which each boy feels a personal interest in upholding. Such a society necessarily requires a provision for the relation between older and younger boys, between the weaker and the stronger; for, in the absence of this, the ordinary aspects of barbarism would be presented, and brute force be alone predominant. Such a provision, acceptable and intelligible to the boys, and reasonable in itself, is believed to be found in the F. system. By this system, it is affirmed, provision is made alike for the claims of age and intellect, inasmuch as it is scarcely possible that any very stupid boy should fag, while no very old boy ever can be fagged.

These are the chief features of the F. system at public schools, and the principal arguments for it and against it. See PENNALISM.

FAGNA'NI, JOSEPH, 1819–73; an American artist, b. Italy. He studied in Vienna and Paris, and came to the United States with sir Henry Bulwer in 1849, and, in 1851, married an American wife. He returned to Europe and made portraits of a large number of public characters, among them Victor Emanuel, Abdul Aziz, Garibaldi, the empress Eugénie, and Ali Pasha. On returning to New York, he painted a series called "The Nine Muses."

FAGUS. See BEECH, *ante*.

FAHLCRANTZ, KARL JOHAN, 1774–1861; b. Sweden; a self-taught painter, whose landscapes were pronounced the best produced in his country.

FAHR'ENHEIT, GABRIEL DANIEL, the improver of the thermometer, was b. at Dantzic about the end of the 17th c., and was originally designed for the commercial profession. His inclination for natural philosophy induced him to quit that business, and having traveled through Germany and England for the purpose of enlarging his knowledge, he settled in Holland. In 1720, he first conceived the idea of using quicksilver instead of spirits of wine in the construction of thermometers, by means of which the accuracy of the instrument was very much improved. See THERMOMETER. In 1724, F. was elected a fellow of the royal society of London; and the *Philosophical Transactions* of that year contain several papers by him on points in natural philosophy. He died in 1740.

FAIDHERBE, Louis Léon César, b. France, 1818. He began a military career in Algeria in 1844; was a captain in Guadeloupe in 1848; again in Algeria in 1851–52, and, in 1854, was made governor-general of the French possessions in Senegal. He largely extended the French territory, and greatly improved the government and property of the colony. To do this, he was compelled to wage a war of extermination against the prophet El-Hadji Omar, who had formed the project of driving out all foreigners and founding an immense Mohammedan empire in central Africa. The struggle ended in 1860, by the submission of the ambitious Omar. In the war with Germany, Faidherbe had chief command of the army of the north. In 1871, he was a member of the national assembly. He is the author of valuable works on African geography and antiquities.

FAIENCE, or Fayence, a general term for all sorts of glazed earthenware and porcelain. The origin of the name is disputed. Some derive it from Fayence, a small town of Provence; others from Faenza, a city of Italy; while certain writers consider that the isle of Majorca is at least the place where it was originally manufactured, in proof of which they appeal to the fact, that the Italians still call Faience *Majolica* or *Mayolina*.

FAI-FO, a seaport of Anam (q.v.) is one of the more considerable marts of the empire. It stands on a river near its mouth, communicating with Turon, 15 m. to the n., by means of a canal. It exports sugar and cinnamon, its principal trade being with China. It contains 15,000 inhabitants, who are mostly Buddhists.

FAILLON, Michel Étienne, 1799–1870; b. Paris; a writer on theology. He was a Sulpician, and visitor to the homes of that order in America. He wrote several valuable books, chiefly on Canadian history.

FAILLY, Pierre Louis Charles Achille de, b. France, 1810. He was in the army in Algeria in 1828; afterwards director of the military school at Toulouse. For services in the Crimean war, he was made gen. of division. In 1859, he was one of Louis Napoleon's aids, and was especially distinguished at Solferino. In the war with Germany, he commanded the 5th army corps. He was surprised and defeated at Beaumont, and his military career ended with the capitulation of Sedan.

FAINÉANTS ROIS (the "do-nothing kings"), the sarcastic designation of the later Merovingian sovereigns of France, under whose name the famous mayors of the palace really governed the country. The first of the do-nothing kings was Thierry III., nominally monarch of Burgundy, Neustria, and Austrasia; the others were Clovis III., Childebert III., Dagobert III., Chilpéric II., Thierry IV., and Childéric III. The last of these was dethroned in 730 A.D., and he being shut up in a monastery, Pepin *le Bref*, mayor of the palace, caused himself to be formally declared king. This was the end of the Merovingian dynasty; it is curious that Louis V., the last of the Carlovingians, and a descendant of Pepin *le Bref*, also received the contemptuous epithet of *Fainéant*, as those monarchs had who were dethroned by his ancestors.

FAINTING, or Syncope (Gr. *syn*, and *koptō*, I fall down), is a condition in which, from a sudden mental or bodily impression, the circulation of blood is temporarily arrested or very much diminished in force and volume, the respiration and the functions of the nervous system being likewise suspended. The indications of F. to a bystander are chiefly a sudden pallor, accompanied by loss of power over the limbs, with disappearance of the pulse and movements of respiration; the eyes are commonly half open or closed, the countenance bloodless, but quite at rest, and not indicative of suffering or disturbance: the flaccid, motionless condition of all the limbs also tends to distinguish simple F. from epilepsy, and the other diseases attended with spasm; whilst the vanishing of the color, and the suppression of the pulse, make a marked distinction between fainting and catalepsy (q.v.), and other forms of hysteria (q.v.); with which disorders, however, F. may in some cases be associated. The mode of origin of F., and the study of its phenomena, alike lead to the conclusion that it is primarily an impression upon the nervous system, very much of the same nature as the collapse, or shock of a severe bodily injury; this reacts, in the first instance, on the heart, and through the circulation on all the other functions of the body. F. may end in death, if too prolonged, or if associated with disease of the internal organs, and especially of the heart; hence a particular variety of F. has been separately studied, and named *syncope anginosa*, or otherwise *angina pectoris*. See Heart, Diseases of the. Ordinarily, a person who faints from mental emotion, a hot and close atmosphere, or other transient cause, is readily restored by being laid on the back with the head low, and surrounded by abundance of cool fresh air. Any tight articles of dress should be loosened, and a stream of cold air, or a little cold water, should be directed to the face and neck, so as to rouse the respiratory movements. It is common, also, to apply ammonia or aromatic vinegar to the nostrils; but a more effective way of exciting the respiration is to compress the ribs, and allow them to expand again alternately, so as to imitate the natural movement. Care should be taken to ascertain that there is no obstruction in the throat or air-passages, as suffocation from mechanical causes has been mistaken for F., and the real origin of the mischief overlooked, with fatal consequences. Should all other

means fail, galvanism (q.v.) will sometimes succeed in restoring the respiration and heart's action.

FAIOUM. See FAYUM.

FAIR. See FAIRS.

FAIRBAIRN, PATRICK, D.D., 1805–74; was b. at Greenlaw, Scotland; graduated at the university of Edinburgh; he was settled, in 1830, as pastor in one of the Orkney islands; was transferred to Bridgeton, near Glasgow, in 1837, and to Saltoun in 1840. For some years he was a professor at Aberdeen, and in 1856, was chosen principal and professor of theology and Greek exegesis in the Glasgow theological college of the free church. His most important writings are *Typology of Scripture*, highly esteemed as learned, judicious, and evangelical; *Prophecy; Hermeneutical Manual; Revelation of Law in Scripture; Commentaries on Ezekiel and the Pastoral Epistles;* a translation of Hengstenberg's commentary on the Revelation, and a portion of that on the Psalms.

FAIRBAIRN, Sir WILLIAM, Bart., was b. at Kelso, in Roxburgshire, in 1789. Having learned a little reading, writing, and arithmetic at the parish school of Mullochy, in Ross-shire, and afterwards got some six months' instruction from an uncle, he was apprenticed to an engine-wright at Percymain colliery, North Shields. When his apprenticeship terminated, F. wrought for two years in London, and then visited many places in England, Wales, and Ireland, working a short time at each, in order to observe the various practices of different localities. Eventually, he commenced business on his own account in Manchester in 1817. It was a struggle in which, without money or connections, only great abilities and perseverance would have succeeded. The first great improvement introduced by F. was the substitution of iron for wood in the shafting of cotton-mills, and the substitution of light for heavy shafting where metal was already in use. This exchange economized the cost of machinery, and enabled the motion to be speeded from 40 to 160 revolutions per minute. F. was amongst the earliest of the iron ship-builders, and has originated various improvements in their construction. The firm has built more than a hundred vessels, varying from the smallest size up to the war-frigate of 2,600 tons.

In 1834–35, F. and Mr. E. Hodgkinson were invited by the British association for the advancement of science to seek out the cause of certain supposed defects in the iron produced by hot-blast furnaces, and a very interesting report thereon appears in the *Transactions* of the association. Nearly at the same time, F. tested the strength of the various kinds of iron of Great Britain, the report of which appears in the *Transactions* of the philosophical society of Manchester, and contains much useful information for engineers. Another report, published in the *Transactions* of the royal society, gives the tenacity of boiler-plates of various thicknesses, and determines the best mode of riveting. He also made a long series of experiments on the resistance of hollow tubes or cylinders to collapse from outward pressure, leading to valuable practical results.

The first idea of a tubular bridge across the Menai strait is due to Robert Stephenson, but its realization is due to F. more than to all other men. Stephenson's idea was a circular tube, supported by chains; but the Britannia and Conway bridges are rectangular structures, strengthened by a series of cells at the top and bottom, and without chains or any other support from pier to pier. The present form results from a long series of experiments upon model tubes—circular, egg-shaped, and rectangular—which were conducted entirely for a long time by F., and latterly, with the aid of Mr. E. Hodgkinson, as a mathematician, to deduce a law from the tabulated results of experiments. F. erected more than a hundred bridges upon this principle. See TUBULAR BRIDGE. F. was a fellow of the royal society; corresponding member of the institute of France, and of the royal academy of Turin; LL.D. of Edinburgh; was president of the British association for the advancement of science, 1861–62; was a chevalier of the legion of honor; and was created a baronet in 1869. His son Thomas was chairman of the art treasures exhibition at Manchester, 1857; was a commissioner for the exhibitions or 1851 and 1862; was high-sheriff of Hampshire, 1870; and was, in 1857, offered the honor of knighthood, which he declined. F., amongst other works and papers, published: *On Canal Steam Navigation; The Strength and other Properties of Hot and Cold Blast Iron; The Strength of Iron at Different Temperatures; The Strength of Locomotive Boilers; The Effect of Repeated Meltings on the Strength of Cast Iron; The Irons of Great Britain; The Conway and Britannia Tubular Bridges; Useful Information for Engineers,* 1st, 2d, and 3d series; and *A Treatise on Mills and Mill-work.* He died in Aug., 1874. See *Life of Sir William Fairbairn, Bart.*, by W. Pole (London, 1877); and Smiles' *Lives of the Engineers.*

FAIRBANKS, ERASTUS, LL.D., 1792–1864; b. Mass. In 1825, with his brother, he established a manufactory for scales in St. Johnsbury, Vt. Their work has a world-wide reputation. In 1836–38, he was a member of the Vermont legislature, and in 1852–53 and 1860–61, he was governor of the state. In all business and social relations he was a man of spotless fidelity and integrity. He was a liberal giver to religious and charitable objects.

FAIRCHILD, JAMES H., D.D., b. Mass., 1817; entered Oberlin college in 1834; was tutor in 1838; professor of languages in 1842; of mathematics in 1847; of theology in

1858; became president in 1866, and (1880) retains that office. He is the author of a work on *Moral Philosophy*, and articles on the education of women.

FAIRFAX, a co. in n.e. Virginia, on the Potomac, intersected by the Virginia Midland and Great Southern, the Richmond, Fredericksburg, and Potomac, and the Washington and Ohio railroads; 430 sq.m.; pop. '70, 12,952—4,284 colored. The surface is hilly, with considerable woodland. Chief productions, wheat, corn, oats, and butter. Washington's residence, Mt. Vernon, on the Potomac, 15 m. below Washington, is in Fairfax co. Co. seat, Fairfax Court-house.

FAIRFAX, JOHN CONTEE, Lord, b. Md., 1830; succeeded to the title on the death of his brother, the tenth lord. He resided in Bladensburg, Md., having formerly practiced medicine in Woodburne, Md. The Fairfaxes are Scotch peers, without a seat in the house of lords.

FAIRFAX, EDWARD, the translator of Tasso's *Jerusalem Delivered*, was a natural son of sir Thomas Fairfax of Denton, in Yorkshire. The year of his birth is not known. He spent his life at Fuystone, in the forest of Knaresborough, in the enjoyment of many blessings which rarely befall poets—competence, ease, rural scenes, and an ample command of the means of study. F. was alive in 1631, but he is supposed to have died shortly after. His celebrated translation of Tasso was made in the reign of queen Elizabeth, to whom it is dedicated. The first edition bears the date of 1600. For poetical beauty and freedom, it has been the theme of universal praise. Dryden ranked F. with Spenser as a master of English, and Waller said that he derived from him the harmony of his numbers. F. also wrote a treatise on *Demonology*, in which he was a believer—a credulity which was probably of no little use to him in the translation of a work full of the machinery of enchantment. Hence Collins says regarding him—

> Prevailing poet, whose undoubting mind
> Believed the magic wonders which he sung.

This treatise is still in manuscript.

FAIRFAX, THOMAS, Lord, gen. of the parliamentary troops in England during the civil wars under Charles I., was the son of Ferdinand, lord F., and was b. in 1611, at Denton, in Yorkshire. He studied at St. John's college, Cambridge, and afterwards served as a volunteer in Holland, under lord Vere, whose fourth daughter, Anne, he married shortly after his return to England. On the outbreak of the civil war in 1642, F. warmly espoused the cause of the parliament, and was appointed cavalry-gen. under his father, who commanded the parliamentary forces in the north. He distinguished himself so much by his valor, prudence, and energy, that in 1645, when the earl of Essex resigned his office of gen. of the parliamentary forces, F. was appointed in his room. In a short time, Cromwell, who had been appointed lieut.gen., obtained unbounded influence over him; and from this time, although nominally head of the parliamentary forces, he really played a secondary part. At last, in June, 1650, he refused to march against the Scots, who had proclaimed Charles II. king, and Cromwell was appointed commander-in-chief in his stead. F. now withdrew into private life, and did not come forward again until after the death of Cromwell, when he showed a zeal for the restoration of the king, gathered troops for that purpose to assist gen. Monk against Lambert; and was appointed one of the delegates dispatched to the Hague in 1660 to promote the return of Charles II. He died at Bilburgh, near York, 12th Feb., 1671. F. had a slight turn for literary pursuits, and wrote several works, prose and poetic; among others, one entitled *Short Memorials*, which was published in 1699.

FAIRFAX, THOMAS, Lord, 1690–1782; born England; educated at Oxford, and known as writer for the *Spectator*. He came to Virginia in 1739 to look after the estate inherited from his mother, the daughter of lord Culpepper, governor of the province. He found nearly six million acres on both sides of the Blue ridge between the Potomac and Rappahannock. He employed George Washington (then but 16 years old) to survey the estate, and the intimacy then formed lasted through life, notwithstanding their radical differences in views of government. In the revolution Fairfax was on the side of England. It is said that the Yorktown surrender so wounded his national pride that it was the immediate cause of his death.

FAIRFIELD, the s.w. co. of Connecticut, bordering on New York and Long Island sound; intersected by the New York and New Haven, the Housatonic, and the Danbury and Norwalk railroads; 647 sq.m.; pop. '70, 95,276. The surface is moderately even, and the soil good, producing cereals, tobacco, butter, etc. Manufacturing is largely carried on, there being more than 800 separate establishments. Co. seats, Danbury and Bridgeport.

FAIRFIELD, a co. in central Ohio, traversed by the Cincinnati and Muskingum Valley, and the Columbus and Hocking Valley railroads, and the Ohio canal; 490 sq.m.; pop. '70, 31,138. Surface undulating, and soil fertile, producing corn, wheat, oats, hay, etc. Co. seat, Lancaster.

FAIRFIELD, a co. in central South Carolina, between Broad and Wateree rivers, crossed by the Charlotte, Columbia, and Augusta, and the Greenfield and Columbia

railroads; 625 sq.m.; pop. '70, 19,838—14,101 colored. The surface is uneven, and the soil fertile, producing corn and cotton. Co. seat, Winnsborough.

FAIRFIELD, a t. and port of entry in Fairfield co., Conn., on Long Island sound and the New York, New Haven, and Hartford railroad, 51 m. n.e. of New York; pop. '70, 5,645. A part of the town has recently been annexed to the city of Bridgeport. The town has a number of villages of importance besides Fairfield, and Southport is the business center. Manufactures are the chief occupation of the people. The village was burned by Gov. Tryon in 1779.

FAIRFIELD, a city and seat of justice of Jefferson co., Iowa, at the junction of the s.w. branch of the Chicago, Rock island, and Pacific, and the Burlington and Missouri river railroads; 50 m. w.n.w. of Burlington; pop. 2,343. It has two institutions of learning, Parsons (Presbyterian) college and Fairfield (Lutheran) college; a court house, schools, and manufactures.

FAIR HAVEN (former town in Conn.). See NEW HAVEN.

FAIR HAVEN, a village in Bristol co., Mass., at the mouth of Acushnet river, on Buzzard's bay, reached by a branch connecting with the Old Colony railroad one mile e. of New Bedford, and 54 m. s. of Boston; pop. of township '70, 2,768. A bridge connects Fairhaven with New Bedford. There are several manufactories in the village.

FAIR HAVENS, a harbor on the s. coast of the island of Crete, the port of Lasaea, about 5 m. e. of cape Matala, and immediately e. of a bold headland, on the summit of which are the ruins of an ancient convent dedicated to St. Paul. On the s. of the harbor are two small islands, and between these and the shore there is safe anchorage. The apostle Paul sailed from this port in Oct., 60 A.D., and was ship-wrecked on the island of Malta a few days afterwards.

FAIR or BENMORE **HEAD**, a promontory of the n. coast of Antrim, Ireland, opposite Rathlin isle, which is 4 m. to the n.w. It rises 636 ft. above the sea. The lower 300 ft. consists of carboniferous strata, overlaid by greenstone columns, 20 to 30 ft. thick, and rising 280 to 300 ft. high. It is perpendicular to the sea, but slopes to the land. The table-land on the top is covered with rich pasture, and presents fine views of the neighboring coast, Rathlin isle, and the Argyleshire highlands, 16 m. distant. On the promontory are two small lochs, 500 ft. above the sea.

FAIRIES—ELVES (Ger. *elbe*, or *elfe*; Sw. *elf*; Dan. *ellefolk*; Old Norse, *alfr*; all allied apparently to Lat. *alb*(us), white, and signifying a bright, benign spirit; Fr. *fée*; Ital. *fata*), supernatural beings, generally of diminutive size, a belief in whom has been among the superstitions of the greater portion of the European nations. The etymology of the word *fairy* is doubtful; some derive it and the Fr. *fée* from a Celtic word *'fuer*, to charm or bewitch; others associate the Fr. *fée* and the Ital. *fata* (a friendly goddess or spirit) with Lat. *fatum*, fate; others, again, trace *fairy* to the *peri* of the Persians (pronounced *feri* by the Arabians), holding it to have been brought to Europe by the crusaders. Be this as it may, the Celtic fees or fairies are undoubtedly relics of those *matres* and *matronæ*, which appear on Gallo-Roman inscriptions as objects of popular belief. After the transfusion of the Teutonic and southern nations, the northern elves (which were originally of two kinds—the light elves, or elves proper, and the dark elves, or dwarfs) became mixed up with their Celtic kindred the fairies in inextricable confusion.

It is generally difficult to give any scientific definition of the nature of a superstition, because its phenomena are continually varying according to time, place, and other conditions. The fairy superstition especially defies definition, because it was the peculiarity of the creatures to whom it referred that they followed no regular law, human or divine, but obeyed the impulse of their own caprice; hence every fairy tale differs from another. Still, there are distinctions and specialities that can be made out from the examination of a large number of these narratives. In the first place, the superstition peculiarly belongs to modern Europe. We find nothing like it among the idolatries of the heathen referred to in Scripture, nor does the word occur in the English Bible, or its equivalent in the original texts. In classical mythology, there is nothing nearer to it than the nymph of the fountain or grove among the Greeks. In the next place, it may be determined that the varieties in the superstition correspond, in some measure, with those of the physical geography of the districts in which it prevails. In those parts of the world where there are mountains, mists, dangerous morasses, cataracts, and stormy oceans, all superstitions, being a belief in supernatural agencies, are naturally exaggerated, and, from the dangers to which the people are liable from the agencies they deem supernatural, the belief takes deep root in their minds. Accordingly, in flat and well-cultivated countries like England, the fairy superstition is simple and homely, connecting itself with matters of domestic routine, such as the sweeping of the dwelling-house, the skimming of the milk, the preservation of the butter, and the like; while in Scandinavia and the Highlands the fairy people are connected with storms and convulsions, betray people to their death, fly away with them into the infinite cloud-land, or lead them through endless caverns within the earth. It has been observed, as a further distinction, that the fairies of the German or Teutonic tribes are more harsh, fierce, uncomely, or deformed than those of the Celtic nations, which have a tendency rather

to the aërial and the graceful. Still, there is so great an amount of common characteristic in the superstition throughout Europe, and its peculiarities have been found so much more emphatically displayed in Scandinavia than elsewhere, as to have suggested to some the view, that the superstition is a remnant of the old mythology of the northern nations, communicated by them to a greater or less extent in all the countries over which their vikings carried their ravages.

There is a further distinction—at least in this country—between the fairies of poetic and heroic literature and those of popular belief—the former being princes and princesses of chivalry, only distinguished from human beings by their superhuman superiority in all the qualities which elicited respect in the age of chivalry; while those of popular belief are small in stature, sometimes decrepit, and endowed with dispositions generally more allied to malignity than magnanimity. It is common to all classes of them to be deemed under the condemnation of the religion of the gospel, and to be either conditionally or unconditionally excluded from the abodes of the righteous in the next world. In Ireland and the Highlands, they have been spoken of as a wandering remnant of the fallen angels. It is sometimes a symptom of geniality and kindliness in a people when their fairies are supposed to be capable of earning their own redemption. Sometimes they are supposed to be human beings, metamorphosed or disembodied, and this form of the superstition has made fairyland a place of purgation for those whose sins have condemned them to it. The analogy is carried out in the belief that the services of the living can extricate the souls so situated; but it is rather through dexterity and courage than pure piety that the feat is achieved, and the rescues from fairyland form some of the most wild and exciting of the elfin narratives—as, for instance, the strange, wild ballad of *Tamlane*.

There is still another broad distinction into those that dwell in the upper air, and those that dwell within the bowels of the earth, while a third class frequent the waters. The surface of the earth on which mankind reside is not deemed the proper place of any class except on special occasions. The Scandinavians called the fairy inhabitants of the air white elves; those of the earth, black. Whatever was genial, light, playful, and benevolent in the superstition, clustered round the former; the latter did all the work that was dark, cruel, and rapacious. Naturally enough, the black or subterranean kind frequented mining districts, where they might be seen extracting the ore for themselves, and thus unwittingly leading the miner to rich veins of metal. They might be seen in an occasional peep through an aperture of a hill in their underground retreats, in chambers supported on jasper columns, where they were stowing away their hampers of gold and silver—for they were generally held to be very affluent. Some of the most exciting tales about the German gnome, and the Irish leprechaun, who was a creature of the same kind, are founded on the efforts of adventurous mortals to get possession of their riches. There exists a legend, occurring in nearly identical terms in several countries, which connects some piece of valuable plate belonging to a church with the underground fairies. The story of the horn of Oldenburg is a type of these narratives. The pictures of it represent it as a beautiful drinking vessel, in the shape of a horn, exquisitely decorated with the finest fanciful silver-work, in the style contemporary with the richest Gothic architecture. The legend is, that one day, Otho of Oldenburg, being exhausted with hunting, and very thirsty, exclaimed: "O God, would that I had a cool drink!" Thereupon there appeared before him, as if coming out of the rock, a lovely maiden, who offered him a drink in the fairy horn. He made off with it, and saved himself from evil consequences by bestowing it on the church. Hence these relics are generally in churches; but one of them is, or lately was, in the possession of an English family, and as their prosperity was traditionally believed to depend on retaining it, it was called "the luck of Eden hall."

Puck and the pixies belong to the same class of beings. Of the ell-folks of Scandinavia, the male is old and ill-favored, but the evil element in the ell-woman or ell-maid consists in her beauty, which enables her to be very dangerous to foolish young gentlemen, whom she waylays either by her own proper charms, or by personating the objects of their affections.

In Ireland, and also in the border country of Scotland, the fairy superstition has been the theme of innumerable poetic legends and mystic traditions. T. Crofton Croker, in his *Fairy Legends and Traditions of the South of Ireland*, 3 vols., 1828, presents a full and amusing account of the Irish fairies or elves, which he describes as "a few inches high, airy, and almost transparent in body; so delicate in their form that a dew-drop, when they chance to dance on it, trembles indeed, but never breaks. Both sexes are of extraordinary beauty, and mortal beings cannot be compared with them." They do not live alone, or in pairs, but always in large societies, and are governed by a queen. The same author adds: "They are invisible to man, particularly in the daytime, and as they can be present and hear what is said, the peasantry never speak of them but with caution and respect, terming them the good people, or friends. They have their dwellings in clefts of rocks, caves, and ancient tumuli. Every part within is decorated in the most splendid and magnificent manner; and the pleasing music which sometimes issues from thence in the night, has delighted those who have been so fortunate as hear it." There are Irish fairies, however, of more special character. Among these are the Banshee, or female spirit who watches a particular family; the

Cluricaune, an elf of evil disposition, who usually appears as a wrinkled old man, and has a knowledge of hidden treasure; and the Phooka, a spirit of diabolical disposition, who sometimes appearing as an eagle or a black horse, hurries the person he gets possession of to destruction. Of similar varieties are the Scottish elves: the Brownie, or domestic spirit nearly corresponding to the Banshee; the Kelpy, a kind of water-horse, being little different from the Phooka; and the Cluricaune being as regards figure somewhat analogous to the being sung by Leyden in his charming ballad, "The Cout of Keilder" (*Minstrelsy of the Scottish Border*):

"Brown dwarf, that o'er the muirland strays,
Thy name to Keeldar tell!"
"The brown man of the muirs, who stays
Beneath the heather-bell."

According to Irish as well as Scottish fairy superstition, the elves, though in the main harmless, or at most tricky, have the bad reputation of stealing away young children from the cradle, and substituting for them a changeling who bears a resemblance to the stolen infant, but is an ugly little creature, and never thrives. On this theft of a female infant, who is carried to Fairyland, but in the course of years returns to her parents, James Hogg founded his fine ballad of "Kilmeny" (*Queen's Wake*). It need hardly be added, that in the progress of general intelligence, the fairy superstition has disappeared in Scotland as well as the greater part of Ireland, and now is as little a matter of credence as is the belief in England of that useful drudging fiend, Robin Goodfellow. Besides being embalmed in imaginative literature, the fairy has a perpetual memorial in the small exquisitely shaped arrowheads found so abundantly in northern countries, where they were long known as elf-arrows, or bolts with which the more malignant fairies sometimes slew or injured cattle and human beings; thus, when a poor man's cow or heifer was suddenly affected with some deadly and incomprehensible illness, it was said to be "elf-shot." See ELF-ARROWHEADS.

For the most comprehensive account in the English language of the various shapes assumed by this superstition, the reader is referred to *The Fairy Mythology*, by Thomas Keightley.

FAIR ISLE, a solitary isle in the Atlantic, 25 m. s.s.w. of Shetland. It is 4 by 2½ m. in extent, and rises 708 ft. above the sea, with high rocky cliffs and promontories. It affords copper ores, and hand-shaped sponges called "trowie gloves." Pop. '71, 226, chiefly fishers. At Stromceiler creek, was wrecked, in 1588, the duke of Medina Sidonia, admiral of the Spanish armada. He escaped, after most of his crew were murdered. From the Spaniards, on this occasion, the natives of F. I. acquired a knowledge of the art of making woolen articles, such as caps, mittens, and stockings, in divers colors, the preparation of which is still a staple employment in the island for purposes of export.

FAIR OAKS, BATTLE OF. See CHICKAHOMINY.

FAIRS (*foire*, from Lat. *forum*, a market place, or *feriæ*, holidays), great periodical markets, some of which are chiefly devoted to one kind of merchandise, while others, of a wider scope, afford opportunity for most of the sales and purchases of a district. F. have long been regularly held in most parts of Europe and in many parts of Asia; but as they belong rather to a state of things which is passing away, than to modern civilization, they have not been established or have not acquired the same importance in America. In Europe, they appear to have originated in the church festivals, which were found to afford convenient opportunities for commercial transactions, the concourse of people being such as took place upon no other occasion. This origin of F. is commemorated in their German name *messen*, which is derived from the word employed to denote the most solemn part of the church service. See MASS. Some festivals, from circumstances of place and season, speedily acquired a much greater commercial importance than others, and began, therefore, to be frequented by buyers and sellers even from remote parts of the world. When the ordinary means of communication between countries and of the exchange of commodities were very limited, F. were of great use. Princes and the magistrates of free cities found it to their advantage to encourage them, and many privileges were granted to them, which in some places still subsist. Courts of summary jurisdiction—commonly called *pié poudre*, from the dusty feet of the suitors—were established distinct from the ordinary courts of the county or city, for the determination of questions which might arise during the fair. In connection with all this, the practice was necessarily adopted of publicly proclaiming the commencement and duration of the fair, and this still subsists where scarcely any other vestige remains of the old privileges of F., and where they have ceased to be of any real use to the community, and might, perhaps, with advantage to all the interests of society, be now abolished, as in the case of some of the annual F. still held in the great cities of Britain.

In western Europe, the goods exposed for sale at F. are chiefly those in respect of which there is a frequent change of fashion. Provisions are seldom an article of merchandise in them; and while in some parts of the continent persons of all ranks still wait for the great yearly F. to make their principal purchases of clothing and of manufactured articles of every description—such things as corn, wine, spirits, tea,

coffee, sugar, tobacco, oil, etc., are seldom seen in them. It is otherwise, however, in places on the outskirts of civilization; and almost all the produce of great provinces is sold, and all the inhabitants require is bought at such F. as those of Kiachta and Nishnij-Novgorod. The British F. really of much use at the present day are chiefly those at which cattle are exposed for sale; of these some held on the borders of the Scottish highlands, and elsewhere in Scotland, are frequented by buyers and sellers from all parts of the kingdom, and bring together the breeders of cattle and the graziers, by whom the animals are to be fed for the butcher. Such are the F., or trysts, as they are called, at Falkirk, Doune, Edinburgh, etc. At other great yearly F. in the south of Scotland, lambs and wool are sold; and F. chiefly for the sale of the annual produce of pastoral districts are common in almost all parts of the world.

The greatest F. in the world are the Easter and Michaelmas F. at Leipsic. These are not to be confounded with the Leipsic book-fair, which is chiefly an occasion for the settlement of accounts among booksellers and publishers. Next to the Leipsic F., those of Frankfurt-on-the-Maine are the most important in Germany. The F. of Frankfurt-on-the-Oder, and of Brunswick in Germany, of Zurzach in Switzerland, Pesth in Hungary, Sinigaglia and Bergamo in Italy, Beaucaire and Lyon in France, and Nijni-Novgorod (q.v.) in Russia, are among the most important in Europe. After the great F. of Leipsic, that called the fair of St. Peter and St. Paul at Nijni-Novgorod is the greatest in the world, and is frequented by buyers and sellers from different parts of Europe, and of northern and central Asia. The F. of Tanta in upper Egypt, of Kiachta in the south of Siberia, of Irbit, also in Siberia, of Mecca in Arabia, and of Hurdwar in western India, are also of very great importance, and are the most considerate F. out of Europe. That of Kiachta is a sort of barter-market, where almost all the commercial transactions between the Russian and Chinese empires take place. The F. in Britain have latterly sunk for the most part to insignificance, and in many instances have entirely disappeared. They were gatherings adapted to a comparatively backward state of society, when the provincial stores of goods were few, and the means of communication defective. The prevalence of good roads, populous towns with dealers in miscellaneous wares, and other tokens of advancement, have superseded the necessity for the ordinary class of F., and in consequence they have in some cases degenerated into scenes of merriment; such was Bartholomew fair, London, now extinct; also Greenwich fair, Glasgow fair, and Donnybrook fair, near Dublin; this last being likewise either extinct, or nearly so. The boisterous merriments at these F. were of old the devices employed as likely to attract a great concourse of people; hence each fair had its sport or drollery—football, wrestling, yawning, cudgel-playing, throwing at cocks, sack races, flying dragons, grinning through horse-collars, mock-giants, monstrous fishes, soaped pigs, smoking matches, eating hot hasty-pudding, whistling, wheel-barrow races. M. Bottin, the author of a statistical *View of the Fairs of France*, says that on examining his work it will appear that they were placed for the most part on the frontiers of the kingdom, or on the marches of ancient provinces; or at the foot of high mountains, at the beginning or end of the snow-season, which for months shuts up the inhabitants in their valleys; or in the neighborhood of famous cathedrals or churches frequented by flocks of pilgrims; or in the middle of rich pastures. A fair in the north of Scotland, held in June, when the nights are very short, began at sunset, and ended an hour after sunrise; it was called "sleepy market."

FAIRS (*ante.*) There are in the United States no fairs of the kind so common in the old world; but the term is applied to a variety of exhibitions, especially of cattle and agricultural products. In a wider sense it includes exhibitions and sales for charitable purposes, and indeed, almost any show where people are expected to bestow patronage and make purchases. During the war of the rebellion, what were called sanitary fairs were held in many cities of the northern states to raise funds for the U. S. sanitary commission, and their success was something entirely unprecedented. Some of the net results were as follows: The New York Metropolitan fair, $1,184,487.72; at Philadelphia, $1,035,398.96; Brooklyn and Long Island, $305,513.83; Boston, $50,000; Baltimore, $40.234.54, etc. The most universal fairs in this country are the annual cattle shows, which are held in more than half of the 3,500 counties in the union. The originator of agricultural fairs in the United States was Elkanah Watson, a prosperous merchant of Albany, N. Y. In 1819, the state legislature, mainly through his influence, appropriated $10,000 a year for six years for premiums on agricultural products and family manufactures. In 1832, the state agricultural society was incorporated. The county societies report to the state society, and that body reports to the legislature. A similar system prevails in many other states. Besides these regular agricultural fairs there are such exhibitions as the fairs of the American institute, of the Franklin institute, of the Maryland institute, and of many other organizations.

FAIRY RINGS are spots or circles in pastures, which are either more bare than the rest of the field, or more green and luxuriant. Frequently a bare ring appears, like a footpath, with green grass in the center, and the circle which the ring forms, or of which it might form a part, is often some yards in diameter. These rings began to attract the attention of men of science in the latter part of the last century, and various hypotheses were suggested to account for them. Some imagined that they might be the effect of

lightning. Dr. Withering appears to have been the first to ascribe them to the growth of fungi. Dr. Wollaston further investigated the subject, which has more recently been very fully investigated by prof. Way; and it is now perfectly ascertained and universally admitted, that F. R. result from the centrifugal development of certain kinds of fungi, especially of *Agaricus oreades*, *A. gambosus*, *A. coccineus*, and *A. personatus*. The common mushroom (*A. campestris*) shows a tendency to grow in the same manner. Probably the spot where the agaric has already grown is unfitted for its continued nourishment, and the *mycelium* (spawn) extends outwards to new soil, the fungus unfitting the soil to which it extends for the immediate nourishment of grass, but enriching it afterwards by its own decay. The *mycelium* of many fungi has certainly a tendency to extend outwards from a center; and decayed fungi, containing not a little of the phosphate of potash, are a highly stimulant manure for grasses. F. R. of large size sometimes occupy the same situation for many years. The circle is almost always imperfect, some accidental circumstance having arrested the growth of the mycelium on one side.

FAITH is used by theologians in various senses. It is sometimes taken to denote the mere assent of the understanding to a set of facts or of propositions set before it; it is more peculiarly used to express the living reception by the heart of the "truth as it is in Christ." Some divines have enumerated no fewer than four kinds of F.: 1. The F. of miracles, or that immediate persuasion of the almighty presence and power of their Master, which enabled the early Christians to work miracles—a persuasion, apparently, which might exist and issue in astonishing results without being associated with moral excellence. "Though I have all faith," says St. Paul, "so that I could remove mountains, and have not charity, I am nothing." 2. Historical F., or the assent of the understanding to truth the evidence of which is irresistible, such as we have described above. 3. Partial or temporary F., such as our Lord implies in his exposition of the parable of the sower, and as appeared to animate those who, after having followed after Christ, turned back and walked no more with him; and 4. Saving F., or the persuasion of Christian truth wrought in the heart by the Holy Spirit.

These distinctions are rather theological refinements than anything else; the proper and characteristic meaning of the term F. in Scripture has little to do with any of them except the last. "Faith," says the writer of the Epistle to the Hebrews, "is the substance of things hoped for, the evidence of things not seen." It is a vision, quality, or capacity of soul whereby spiritual truth is apprehended, and spiritual life engendered. The distant is brought near by it, and substantially appropriated; the unseen is felt to be a reality. F. is the organ by which the soul passes beyond the present and the visible to the eternal and the invisible. Still more characteristically, perhaps, F. is the living affection which binds the Christian to Christ *as a Savior*. "Faith is a saving grace whereby we receive and rest upon Christ alone for salvation, as he is freely offered to us in the gospel." This is its highest and most comprehensive meaning, out of which all the others come. "What shall I do to be saved?" asked the Philippian jailer of Paul. "Believe on the Lord Jesus Christ," he replied, "and thou shalt be saved." And it is remarkable how frequently it is Christ or God—a living person—rather than any mere truth or series of truths which is represented as the proper object of Christian faith. "Ye believe in God; believe also in me." "We believe in him that raised up Jesus our Lord from the dead." "Abraham believed God, and it was accounted to him for righteousness." "Come unto *me* all ye that labor and are heavy laden, and I will give you rest."

F., therefore, in this its highest view, is nothing but trust in God and in Christ. This is the F. which "worketh by love," and "overcometh the world"—the faith of which St. Paul and St. John alike speak. The F. mentioned by St. James in apparent conflict with works is different; it seems to have been a mere religious distinction. "Thou hast faith, and I have works." One party put forth F. as their religious badge—another works. The spiritual or true meaning of either the one or the other was little regarded.

F., in the distinctly Christian sense, can only exist by the operation of God's Holy Spirit. "For by grace are ye saved, through faith; and that not of yourselves; it is the gift of God." Orthodox divines greatly insist on the nesessity of this operation of the Spirit of God, yet not so as to exclude the active co-operation of man. The Pelagian and Antinomian extremes respectively throw out—the former the divine, the latter the human element. Orthodoxy combines the two, attributing to God the effective agency, but to man a real and voluntary concurrence. Some of the principal theological controversies connected with F., and not here already mentioned, will be noticed under JUSTIFICATION.

FAITH, ANALOGY OF. See ANALOGY, *ante*.

FAITHFULL, EMILY, b. England, 1835. She was early presented at court, and introduced to fashionable life in London, but became interested in improving the condition of working women. In 1860, she established a printing office in which women were employed as compositors, with great opposition, but with the approval of the queen. In 1863, she issued the *Victoria Magazine*, a monthly advocate of her work, and in 1868, *Change upon Change*, a novel. She also delivered public lectures on the employments of women, lecturing in 1872–73 in the United States. In 1877, she began the

publication of the *West London Express*, the type-setting being wholly by women. The success of this publication has led to the employment of large numbers of women, and the introduction of steam machinery into the office.

FAITHORNE, WILLIAM, a very eminent English engraver, was b. in London in the early part of the 17th c., but the exact date is not known. He was a pupil of Mr. (afterwards sir Robert) Peake, printer and printseller. On the outbreak of the civil war, he followed his master, who had taken up arms for king Charles. Both were taken prisoners at Basing-house. F. was sent to London, and imprisoned in Aldersgate, but after some time was released, and obtained permission to leave the country. He went to France, where he increased his proficiency in the art of engraving, and returning to England about 1650, commenced business as a printseller near Temple Bar. He also engraved steadily for the booksellers at the same time. About 1680, he gave up his shop, but still prosecuted his art, besides executing portraits in crayon, and painting in miniature. He died in May, 1691. F.'s engravings are for the most part portraits. Walpole has given a pretty full list of them, a few of which we may mention, such as the portraits of "Thomas Hobbes," ætat 76; "Henrietta Maria;" "Cromwell;" "Prince Rupert;" "Sir Thomas Fairfax;" and "John Milton," ætat 62. At first F. imitated the Dutch and Flemish manner of engraving; but his residence in France appears to have considerably modified his earlier style. F. is also an author, having published in 1662 a treatise on engraving, dedicated to his old master, and entitled *The Art of Graveing and Etching, wherein is expressed the true Way of Graveing in Copper; also, the manner and Method of that famous Callot and M. Borse in their several Ways of Etching.*

FAITH, RULE OF, is that which determines what man is to believe concerning his origin, duty, and destiny. I. Many persons, denying either the possibility or the fact of a supernatural revelation, maintain that human reason alone, as possessed by all persons of sound mind, is both the source and ground of all religious knowledge and conviction of duty. II. Others, either denying or depreciating the authority of any external revelation, affirm that every man, in connection with his reason, yet as the enlightener of it, has an inward revelation—God with him—to which pertains the supreme authority in the belief of truth and knowledge of duty. III. The Roman Catholic church, admitting that truth supernaturally revealed is the rule of faith, teaches that the revelation actually given is partly written (as contained in the Old and New Testaments and the Apocrypha) and partly unwritten (as treasured up in divine and apostolic traditions); and that, consequently, the rule of faith includes both Scripture and tradition. And, as the people cannot surely and perfectly understand either of these, the only authorized interpreter of them both is the church, the infallibility of which is vested in the pope. Thus, ultimately, for every Roman Catholic, the rule of faith is the teaching of the infallible pope of Rome; and this, practically, for the mass of the people, resolves itself into the dictum of the parish priest, from whom they are bound to receive whatever he tells them as the judgment of the pope. IV. Protestants believe that all extant revealed truth is contained in the canonical Scriptures of the Old and New Testaments; and therefore teach that these (received by every man, after due inquiry, as the word of God, and interpreted according to his own judgment, enlightened through the use of all accessible helps, human and divine) constitute for him the rule of faith. Among those holding this general principle of Protestantism there are recognized diversities, according as, on the one hand, the authority of the Bible —even in its letter—is intensified, or, on the other hand, the sphere of human reason in interpretation of its spirit is enlarged. Also to the *consensus* of the church are assigned differing degrees of authority in the interpretation of Scripture among different sections of Protestants

FAIZÁBÁD, a division in British India comprising the districts of Faizábád, Gonḍá, and Bharaich; 7,671 sq.m.; pop. '68, 3,379,262, of whom 3,028,502 were Hindus.

FAIZÁBÁD, a district in Oude, British India, between the Gogra and Gumti rivers; 1649 sq.m.; pop. 1,024,092. Ajodhya, the capital of the ancient kingdom of Oude, so conspicuous in the Sanscrit epics, is in this district. In more modern times the district was the center of the nawab vizier's influence, and contained his capital until the removal of his court to Lucknow in 1775. The district is intersected by the Oude and Rohilcund railroad, and has important trade in rice, wheat, sugar, indigo, opium, etc.

FAIZÁBÁD, a city, the administrative headquarters in the district of the same name, on the Gogra river, India. A suburb of the city is the old Ajodhyá, the ancient capital of king Daswratha, the father of Ráma, the hero of Rámáyaná. Of this ancient city, said to have covered a large area, scarcely a trace remains. The city of Faizábád was founded about 1730 by Alí Khán, the first nawab of Oude, who made it his capital. The place rapidly grew in importance until 1775, when the court of Oude was removed to Lucknow. It then rapidly decayed, all the leading merchants, bankers, etc., abandoning the place. In 1839, Butter estimated its pop. at 100,000, but fast diminishing, owing to the exactions and oppressions by the native officials of the nawáb's government. At the time of the census in 1869, Faizábád contained only 37,804 inhabitants; but it is now again advancing in prosperity, and is rapidly becoming an emporium of trade. At the time of the annexation of Oude in 1856, Faizábád was made, and still continues to be, a large military station. On the outbreak of the mutiny in 1857, the cantonment

contained two regiments of infantry, a squadron of cavalry, and a light field battery of artillery—all natives. Owing to their threatening demeanor after the Meerut massacre, many of the European ladies and children were sheltered by one of the great landholders of Oude, and others were sent forward to less disturbed parts of the country. The troops rose, as was anticipated, and although they at first permitted their officers to take boats and proceed towards Dinapur, a message was afterwards sent to a rebel force lower down the river to intercept the fugitives. Of four boats, one succeeded in reaching Dinapur safely, having passed the rebels unnoticed. Of the occupants of the other three boats, one person alone escaped. Faizábád is now a station for European as well as native troops.—[Condensed from *Encyclopædia Britannica*, 9th ed.]

FAKIR', a word derived from the Arabic *fakhar* (poor), and designating a member of an order of mendicants or penitents, chiefly in India and the neighboring countries. In Persia and Turkey, the word is also used for Moslem priests and dervishes (see DERVISH). The origin of fakirism, an institution which reaches back to the most remote antiquity, is lost in mythical darkness. The common account of the son of a mighty rajah, who, expelled from his home and country by the cruelty of his father, made a vow, half in revenge, and half in contrition, henceforth to roam a beggar through the world, and to win proselytes to a life of poverty and self-mortification, as the one most befitting in man, and most pleasing to the Deity, can hardly be called historical. The same yearning for rest, for peace, and pious contemplation, for escape from the noise and turbulence of the world, which has everywhere and always led still and pensive minds into seclusion and solitude, must naturally have been more powerful here, in a land which yielded almost of itself, and in abundance, all that was necessary for the sustenance of man—in a climate of flower and sunshine, where a hermit's calm retreat might well rise before the wearied eye in all the soft sunset hues which surround the abode of the recluse in the Ramayana, or in the Sakoontala. But constant seclusion and ceaseless meditation here, as elsewhere, produced in all but exceptional minds their sad results. Piety is no longer enough; sanctity is the goal. Thus, abstinence becomes mortification and self-torture; mental repose, mystic self-absorption, or frenzied exaltation. This leaning of the Hindus to a life of asceticism was fostered by their primeval religion, which enjoins various exercises of penance and mortification upon the three higher castes in general, but upon the Brahmins in particular. These, having passed through different stages of regeneration, end by becoming Sanyassis ("who have left everything"), and are dead to the law. The world and its usages have no more any claim upon them; even religious ceremonies are no longer necessary to the "united with God." They go naked, or in filthy rags, receive the meanest food only, and that without either demand or thanks. Their ethical code consists in the observance of truth, chastity, internal purity, constant repentance, and contemplation of Deity. After these models fakirism seems chiefly to have been framed, and its adherents were not only pious men, but occasionally saints, workers of miracles, and healers of all ills, especially epilepsy and sterility. The halo which from the first surrounded fakirism, and the ready worship offered by the people, attracted to its ranks, at a very early date, many whose motives were anything but pure, and who, under a garb of humility and mendicity, collected fabulous treasures. Strabo already distinguishes these vagabonds from the more honest members of their class, and if we may trust the travelers of our own day, the more respectable element has now altogether disappeared. Their number is variously stated. In the time of Tavernier's visit, there were more than 1,200,000 Hindu, and 800,000 Mohammedan fakirs in the East Indies, and their present number is said to exceed 3,000,000. Papi describes the Mohammedans as guilty of the greater follies. At times, especially in their return from distant pilgrimages, they are even dangerous, as the killing of an unbeliever is supposed to be an infallible introduction to the glories of paradise. They live either separately as hermits or solitary mendicants, or unite in large gangs, carrying arms and a banner, beating drums, and sounding horns as they approach a town or village. Their appearance is disgusting in the extreme; they go naked, besmeared with the dung of the holy animal, the cow. Some bedeck themselves with the skins of serpents, some with human bones; others array themselves in the garb of women. Their fearful shrieks, and the hideous rollings of their eyes, add to the disgust of their appearance. Imitating madmen, they generally end by becoming madmen. The height to which self-torture is frequently carried by these wretched fanatics, and of which we meet with signs even so far back as the Ramayana, where a penitent is described as perpetually sitting with upraised arms between four fires, the sun forming the fifth, is so appalling that human nature shrinks from the mere description. Some pass their whole lives in iron cages, laden with heavy chains; some clinch their fists till their nails grow through the hand; others hold aloft both their arms till they become like withered branches; while others, again, tie their hands and feet together, and roll head over heels for thousands of miles. Not the least sad feature in all this is, that these religious antics are not confined to men, but that youths, and even children of tender age, are occasionally initiated therein.

FALABA, a t. in w. Africa, 190 m. n.w. of Freetown, in Sierra Leone, on the Fala river. It was founded by the Sulimas who revolted from the Mohammedan Foulas, and its warlike inhabitants soon attained supremacy over the neighboring villages and country. The town consists of 4,000 to 5,000 small huts arranged in clusters around

squares or court-yards; and although built of clay, they are neat and in some instances even elegant.

FALAISE, a t. of France, in the department of Calvados, is situated on a lofty plat form bordering on a precipice, or *falaise*, whence its name. It is situated on the Anté, a feeder of the Dive, 22 m. s.s.e. of Caen. It has three suburbs, one of them, Guibray, a mile to the e., rivals the town itself in size and population. The buildings of interest are the ecclesiastical edifices, the hospital, the public library, and, more than all, the old and ruined castle, once the seat of the dukes of Normandy, and the birthplace of William the conqueror. In the castle, the chamber in which the conqueror was born is still shown, as well as a tower called "Talbot's" tower, which is supposed to have been built by Talbot when lord warden of the district, after the capture of F. by Henry V. of England. F. has manufactures of cottons, hosiery, and bobbin-net. At Guibray, an important annual fair is held, at which great numbers of horses and cattle are sold. It takes place between the 10th and 25th of August. Pop. '76, 8,120.

FAL'ASHAS (i.e., Exiles), the degenerate Jews of Abyssinia, found in considerable numbers in the provinces w. of Takazze. It is doubtful whether they are to be ethnologically identified with the seed of Abraham, or regarded, like the Khazars of the 8th c., as, for the most part, mere proselytes to Judaism. As to the date when the race or the religion was introduced there is no authentic information, one account carrying it back to the days of Solomon and his hypothetical son Menelek by the queen of Sheba, another to the time of the Babylonian captivity, and a third only to the 1st c. of the Christian era. That one or the other of the earlier dates is probably correct may be gathered from the fact that the Falashas know nothing of either the Babylonian or Jerusalem Talmud, make no use of the tephilin, and observe neither the feast of Purim nor the dedication of the temple. They possess—not in Hebrew, of which they are altogether ignorant, but in Ethiopic (or Geez)—the canonical and apocryphal books of the Old Testament; a volume of extracts from the Pentateuch, with comments, given as they think from God to Moses on Mount Sinai; the Te-e-sa-sa Sanbat, or laws of the Sabbath; the Ardit, a book of secrets revealed to twelve saints, which is used as a charm against disease; lives of Abraham, Moses, etc.; and a translation of Josephus called Sana Aihud. A copy of the Orit or Mosaic law is kept in the holy of holies in every mesgeed or synagogue. Various pagan observances are mingled in their ritual; every newly-built house is considered uninhabitable till the blood of a sheep or fowl has been spilt in it; a woman guilty of a breach of chastity has to undergo purification by leaping into a flaming fire; the Sabbath has been deified, and, as the goddess Sanbat, receives adoration and sacrifice, and is said to have ten thousand times ten thousand angels to wait on her commands. There is a monastic system, introduced it is said in the 4th c. by Aba Zebra, a pious man who retired from the world and lived in the cave of Hoharewa, in the province of Armatshoho. The monks must prepare all their food with their own hands, and no lay person, male or female, may enter their houses. Celibacy is not practiced by the priests, but they are not allowed to marry a second time, and no one is admitted into the order who has eaten with a Christian, or is the son or grandson of a man thus contaminated. Belief in the evil eye or shadow is universal, and spirit-raisers, soothsayers, and rain-doctors are in repute. Education is in the hands of the monks and priests, and is given only to boys. Fasts, obligatory on all above seven years of age, are held on every Monday and Thursday, on every new moon, and at the Passover (the 21st or 22d of April). The annual festivals are the passover, the harvest feast, the Baala Mazâlat or feast of the tabernacles (during which, however, no booths are built), the day of covenant or assembly, and Abraham's day. It is believed that after death the soul remains in a place of darkness till the third day, when the first taskar or sacrifice for the dead is offered; prayers are read in the mesgeed for the repose of the departed, and for seven days a formal lament takes place every morning in his house. No coffins are used, and a stone vault is built over the corpse so that it may not come into direct contact with the earth. The Falashas are an industrious people, living for the most part in their own villages, or, if they settle in a Christian or Mohammedan town, occupying a separate quarter. They engage in agriculture, manufacture pottery, ironware, and cloth, and are especially sought after for their skill in mason-work. Their numbers are variously estimated at from 80,000 to 200 000. [Largely from *Encyclopædia Britannica*, ninth edition.]

FALCHION. See SWORD.

FALCIDIAN LAW, so called because proposed by a Roman tribune named Falcidius. It was enacted in the time of Augustus, 37 years before the Christian era, and provided that testators could dispose of only three fourths of their property by will, and that the remaining one fourth should go to the heir. The common law imposes no such restriction, but allows a testator to dispose of his whole estate among strangers, leaving his family unprovided for. In some of the American states there are laws restricting the power of the testator in making bequests to charitable institutions. In New York one half only of a man's property, after the payment of his debts, can go to charitable uses, if a wife, child, or parent survive.

FALCON, *Falco,* in the Linnæn zoology, a genus of birds, including all the diurnal birds of prey, now known as the family of *falconidæ;* but in its present use as a generic name, limited to nearer accordance with its popular use, as a designation of those species which, in the language of falconry, were styled *noble birds of prey.* The true falcons are characterized by a bill curved from the base, the upper mandible hooked at the point, and the cutting edge of the upper mandible furnished with a strong projecting notch, or *tooth.* The claws are also sharp, curved, and strong; and in accordance with all this powerful armature, the whole frame is very robust and muscular. The legs are rather short, and have great power in striking or seizing prey. The keel of the sternum (breast-bone) is very large, and adapted for the attachment of powerful muscles; the furcula and coracoid bones (see BIRDS) are also very strong, so as to afford a sufficient resisting base for very powerful action of the wings. The wings are long and pointed, the first and third quill-feathers of equal length, the second rather the longest, the first and second quill-feathers emarginated near the tip. The true falcons are bolder in proportion to their size than any other falconidæ—even eagles. Their acuteness of vision is wonderful; and they have very great powers of flight. A F. is known to have traversed the distance between Fontainebleau and Malta, not less than 1350 m., in 24 hours. The speed attained by a F. in pursuit of its prey has been calculated to be at the rate of 150 m. an hour. They soar to a prodigious height in the air, always endeavoring to outsoar any bird of which they may be in pursuit, and to swoop down upon it from above; although it is far more difficult for them to rise vertically in a calm atmosphere than for birds of short and rounded wing, and they either rise obliquely—often also making their onward flight in a series of arcs—or avail themselves of the wind, and by flying against it, are borne aloft as a boy's kite is. The species are pretty numerous; some of them are of very wide geographic distribution, whilst others are peculiar to certain countries or climates. The British species are the gyrfalcon (q.v.), or jerfalcon (*F. gyrfalco*), also known—although, perhaps, with difference of variety—as the Iceland F. and Greenland F.; the peregrine F. (q.v.) (*F. peregrinus*), of which the female is *par excellence* the F. of falconers (see FALCONRY), and the male is the tercel, tiercel, or tercelet; the hobby (q.v.) (*F. subbuteo*); the red-footed F., or red-legged F. (*F. rufipes*), a small species, much resembling the hobby; the merlin (q.v.), (*F. æsalon*); and the kestrel (q.v.), or windhover (*F. tinnunculus*). For the species chiefly used in falconry, see FALCONRY.

Very closely allied to the true falcons are the species constituting the genus *hierax,* very small, but remarkable for strength and courage, natives of the East Indies. The upper mandible has two notches. In the *harpagons* (*harpagus* or *bidens*) of South America, both mandibles have two notches. None of these, however, are equal to the true falcons in length of wing.

For particulars regarding the falconidæ, as subservient to field-sports, see FALCONRY.

FALCO'NE, ANCILLO, an eminent Italian battle-painter, b. at Naples in 1600. A fellow-student of Salvator Rosa's at Spagnoletto's studio, he himself subsequently became the founder of an academy of much resort. In accordance with his turbulent impulsive nature, he flung himself into the political struggles of the times, and during Masaniello's outbreak, organized his numerous scholars and dependants into a secret band, which inflicted deadly retaliation on the Spaniards. On the suppression of the insurrection, F. fled to France, but subsequently returned to Naples, where he died in 1663. The works of this painter, representing chiefly military scenes, are few in number, and costly in price; they are prized for their extreme fidelity to nature, as much as for their harmony and brilliancy of color, and their variety of expression.

FALCONER, HUGH, 1808-65; b. Scotland; botanist and paleontologist; graduated at Aberdeen, and in medicine from Edinburgh university. He went to India as assistant surgeon, where he became deeply interested in paleontology and geology. On his recommendation the culture of the tea plant was undertaken in India. In 1848, he was professor of botany in the Calcutta medical college. He was a member of many learned societies.

FALCONER, WILLIAM, was b. in Edinburgh in 1732, and was one of a family of whom all, excepting himself, were deaf and dumb. He went early to sea, serving his apprenticeship on board a merchantman; and before he was 18 years of age he was second mate, in a vessel in the Levant trade, which was shipwrecked off cape Colonna, himself and two others being the only portion of the crew saved. He published *The Shipwreck* in 1762, and during the next year he entered the navy as midshipman in the *Royal George.* When peace came, he resided in London, where he wrote a satire on Wilkes, and compiled a *Nautical Dictionary.* He proceeded to sea in Sept., 1769, as purser in the *Aurora* frigate; reached the cape of Good Hope in Dec.; and perished with his companions—the *Aurora* having gone down—in the Mozambique channel.

F. wrote several poems, but *The Shipwreck* is the one on which his fame rests. It abounds in nautical language, and has the rare merit of being interesting. It is not a great poem, but it has always had its readers and admirers. In the second edition, the author added the characters of Albert, Rodmond, Palemon, and Anna—characters bearing the same relation to actual sailors that Alexis and Chloe bear to actual shepherds and shepherdesses—and to some extent destroyed that singleness of impression which was the chief merit of his work.

FALCONET, a name used in the 15th and 16th centuries for the smallest class of cannon. The ball weighed from 1 lb. to 3 lbs., and the gun from 5 cwt. to 15 cwt.

FALCONI'DÆ, a family of diurnal birds of prey (see ACCIPITRES), corresponding with the Linnæan genus *falco*, and exhibiting those characters of muscular vigor, armature of beak and talons, and power of flight, which are to be found in their highest perfection in the true falcons (q.v.), and in a scarcely inferior degree in the eagles (q.v.). The species are numerous; the British museum alone contains specimens of almost 200 unquestionably distinct species; but very many supposed species have been named and described by ornithologists, which, in the progress of science, have been ascertained to owe their distinctive characters merely to age and sex. The female is generally larger than the male; and the plumage of the young different from that of the adult. There are, in the different groups, considerable diversities in the curvature and strength of the bill, which also has the cutting edges of the mandibles either notched, festooned, or plain; the legs and toes also exhibit diversities as to length, strength, feathering, etc.; and in some groups, the wings are much longer, and at the same time more pointed, than in others. This is particularly the case with the true falcons, as contrasted with eagles, hawks, buzzards, kites, harriers, etc., and, in the language of falconry, the former—having the second quill-feather longest, and the first nearly equal to it—are called *noble birds of prey* (see FALCONRY), being those usually domesticated and trained for the service of man; the latter—having the fourth quill-feather longest, and the first very short—are called *ignoble birds of prey*, even eagles receiving this designation. The F. are distributed over all parts of the world; and almost all kinds of vertebrate animals, except the largest quadrupeds, are the prey of some of them. Some also devour insects. Like the *felidæ* among ravenous quadrupeds, the F. do not willingly feed on carrion, but generally seize and kill their own prey. As in the *felidæ*, also, there is a provision for the preservation of the claws from being blunted by unnecessary contact with the ground, or with any hard substance, the F. contracting the toes so as to elevate their claws. The F. generally live in pairs.

The lämmergeier (q.v.) connects this family with the vultures; the secretary (q.v.), whilst in many respects agreeing with the F., is peculiar in some of its characters.

FALCONRY, the term applied to the art of training certain of the falcon tribes to the pursuit and capture, on the wing, of birds such as the heron, partridge, lark, rook, magpie, wild duck, pigeon, etc. In ancient times, this sport was called HAWKING, a term still preserved in many places, and which, perhaps, is the more strictly correct of the two. Nowadays, *falconry* is the term applied to the sport and all that pertains to it; *hawking* to its actual practice in the the field. F. is of very ancient origin, and has been traced back, as an eastern sport, to a period anterior to the Christian era. In Britain, it seems to have been followed before the time of the heptarchy; and in the celebrated Bayeux tapestry, Harold is figured with a hawk upon his hand. It seems, however, to have been practiced in eastern countries, and in central Europe, long before it became established in Great Britain; and to such a height did the sport reach in Germany, that nobles, and even kings, seem to have devoted to it the greater part of their time. As an instance of this, the emperor Frederick II. of Germany was a passionate admirer of the sport, and is said to have written a treatise on F., published by J. G. Schneider in 1788 (3 vols. Leip.). In England, after the Norman conquest, F. seems to have taken rapid strides, being much indulged in by kings, nobles, and ladies; and in those days the rank of the individual was indicated by the particular species of hawk carried on his wrist. Thus, an earl carried a peregrine falcon. In the 17th c., the sport declined; in the 18th c., it partially revived, but again fell off about the year 1725, when the art of shooting birds on the wing came into fashion. In the present day, an attempt is being made in several quarters in England to restore this noble sport, and already its restoration is being attended with growing success. In India, Persia, and other eastern countries, F. is still eagerly practiced, the methods there followed being for the most part nearly similar to those of Great Britain.

In F., two distinct kinds of hawks are used—the long-winged or true falcons, and short-winged. The first (noble birds of prey) are represented chiefly by the gyrfalcon and peregrine; the second by the goshawk and sparrow-hawk; and though for certain purposes the male is superior, as a rule the *females* of each species are much more highly esteemed for sporting purposes, from their being larger and more powerful. "Long-winged" hawks may also, as a rule, be distinguished from the "short-winged," by their having a "tooth" or notch on the upper mandible; from the second feather of the wing being either longer, or as long, as the third; and from their impetuous "stoop" at their prey.

The gyrfalcon (q.v.) is the largest species, but from its extreme rarity in the British islands, is seldom used. The peregrine falcon is the bird in greatest favor with falconers, and if taken from the nest, as is usually the case, and carefully trained, affords better sport than any other British species. We shall therefore confine our remarks, for the most part, to the sport as it is practiced with this bird.

No hawk is fit for sporting purposes until it has undergone a careful process of training. The young hawk is more easily trained than that which has been caught in a wild state, but in either case, a number of operations require to be gone through before the

sportsman ventures to take his falcon into the field. Taken from her nest on some high and dangerous cliff when nearly fledged, the *eyess*, or young falcon (with her companion-fledglings, usually two in number), is carefully conveyed to the falconer's home: there she is kept in an open shed in a nest of straw, and fed several times a day upon fresh beef, with an occasional change of birds or rabbits. At this somewhat critical period, she should never be handled, except to put on the *jesses* and *bells*, which afterwards becomes permanent fixtures. Her powers of flight, too, being as yet very limited, she depends upon her master for regular supplies of food, and soon learns to come for her meals at his call. Her meat is usually fixed to an apparatus termed the *lure*, and thus the hawk is early accustomed to that important instrument, the further uses of which are explained below. By degrees her powers of flight are strengthened, and she is permitted to fly at large (returning to the lure at her master's will to be fed, or in hawking language, to remain *at hack*) for several weeks, during which time her meals are gradually reduced to one a day. While at hack, she sometimes becomes wild, wanders far from home, and kills game for herself; and when this is the case, she is usually caught by enticing her to a bow-net, close to which a pigeon or some meat is fastened to the ground. After being "taken up" from hack, she is kept at the *block*—the stand upon which she sits—for a few days before her regular training begins. At this time, also, hawks require a bath twice or thrice a week.

The first of the principal operations in training is *hooding*, an operation which, if successfully performed by the trainer during his earlier efforts, paves the way for overcoming many subsequent difficulties. It demands the greatest patience and the tenderest manipulation. The hood is a cap of leather, made to fit the head of the falcon in such a manner as totally to obscure the light, a single aperture only being left, through which the beak protrudes, and a slit behind, through which are passed the braces or ties that secure the hood to the head. By shutting out the light, the hood is serviceable in tending to make the hawk quiet and tractable, but to accustom the falcon to submit to its use requires much time and great management. When, after great perseverance, this is achieved, the hawk is said to be "*made to the hood*," during which process she also learns to sit balanced upon the fist. Besides tending to induce docility by hiding the light, the hood is of further service in shutting out from view any object which might cause the hawk to flutter or *bait* off the fist or *cadge* on its way to and from the field, etc. Hence the hawk is carried always hooded—the short-winged only being exempt. To the falcon's legs are attached two small hollow globes of thin metal, called *bells;* these, again, are fixed to their place by leather straps called *bewits;* and both, together with the jesses, become permanent fixtures even during the bird's flights. *Jesses* are two leathern straps, 5 or 6 in. in length, attached to each leg immediately below the bells; the jesses, again, are themselves attached to another leathern strap, called the *leash*, about four times the thickness of a boot-lace, by two rings or *varvels;* and the bird being thus caparisoned, the falconer winds the leash through his fingers, and so prevents the falcon's escape while on his wrist. Instead of varvels, some falconers follow the Dutch plan of using a swivel: the former method, however, is now considered the best. A long cord, called the *creance*, is further attached to the leash, and is used for the purpose of giving the bird greater freedom during her training than that afforded by the leash alone.

The *lure* is a bunch of feathers attached to a cord and tassel, and in the center of the feathers is usually a piece of spliced wood, to which a piece of meat may be attached. By accustoming the hawk to feed off the lure, or to come to it at a certain call or whistle to be fed when on the wing, the lure becomes an important adjunct to the falconer's apparatus, as by it he is enabled to entice his bird back after an unsuccessful chase. On such occasions, the falconer reclaims his bird by swinging the baited lure round and round his head, accompanying the action by some well-known call. Four wings tied together make a good lure. The *tabur stycke* and *drawer* were formerly used for the same purpose as the lure, but were made in the form of a stick.

In Europe, hawks are carried on the left wrist (while in the east they sit upon the right); and to protect the falconer's hand from being injured by the bird's claws, a glove of stout buckskin leather is used. And here it may be remarked, that the claws and beak of wild caught or *haggard* falcons, are usually pared or *coped*. If the bird to be trained, instead of being a nestling, happens to be a wild one, the difficulties of training are immeasurably increased, and can only be overcome by days and nights of unwearying exertion. If it proves unusually restless and difficult to tame, it is kept on low diet, is prevented from sleeping for several days and nights, and has cold water poured upon it by means of a sponge, etc. By these and other means, the falcon gradually loses much of its restiveness, and submits with tolerable readiness to the processes of training.

For training the *eyess*, or young falcon, to the lure, as preparatory to entering at game, sir John Sebright says: "Take the hawk out while very hungry, and let an assistant swing the lure round his head steadily, and at full length of the cord; upon this the falconer casts off his hawk with the usual whistle or halloo, still holding the *creance*, and the assistant suffers the lure to fall to the ground, for fear of injury to the hawk, by striking it in the air with the two strings attached. When this lesson is perfect, the assistant, instead of suffering the lure to fall, withdraws it, and disappoints the hawk, which flies by him, and then returns, when he may be suffered to strike the lure and

feed upon it. In process of time, the creance may be removed, and the hawk enticed to the lure from a considerable distance, and may then strike it in the air (if the lure is a light one), while swinging round the head of the assistant. After a still greater time, the hawk becomes so perfect that she will circle round the head of the falconer, waiting for the lure to be thrown, and is then said to '*wait on*' perfectly. When the hawk is feeding on the lure, the falconer should encourage her, and suffer her to finish without alarm, by which she will be shown that she may do so without fear, and will readily suffer herself to be taken after flying. She should also be accustomed to horses, men, and dogs."

Having "made the hawk" to *the fist, the hood,* and *the lure,* she is next "entered" at her game (the *quarry*). This is done by tying a long cord or *creance* to the varvels of the jesses, and flying the hawk from the hand at a bird thrown out to it, also restrained by a cord. The hawk is next flown several times without a creance at birds *shortened in their flight,* after which it is ready to be entered at wild quarry. In case of failure, however, a live bird, similar to that at which she is flown, should be carried to the field, and thrown out to her in a creance by way of encouragement.

The heron is, and always has been, a favorite object of pursuit in British F., the period of the year best adapted for the sport being the breeding season. Having previously ascertained the feeding-place of that bird, the hawking party makes for the spot, usually towards evening, if possible in a direction *down-wind* from the heronry, so as to intercept the bird in its *up-wind* flight homewards. When a heron is seen to pass, a couple (a cast) of hawks are unhooded and "cast off," and the chase commences. The heron, seeing the falcons approach, disgorges its food, to lighten itself, and immediately ascends in the air; the hawks, eager in pursuit, and quicker of wing, speedily make upon it, and strive to gain a greater elevation by a series of beautiful gyrations. When one of the hawks succeeds in rising above the heron, it *stoops,* that is, descends swiftly, and in a direct line, upon the game, aiming a stroke with its outstretched legs and talons at its body; this the heron almost always succeeds at first in eluding, by a rapid and sudden movement aside. The second hawk, which by this time has also soared, then stoops, while the first is regaining its former altitude; and so on for many successive times, till one hawk at length clutches the heron or *binds,* upon which her companion joins her, and the three, buoyant by the motion of their wings, descend gently to the earth. The falconer's imperative duty is now to be up or near the spot where the three birds are descending, to divert the attention of the hawks before they reach the ground, and entice them from the quarry to him, by means of live pigeons as lures. This is very necessary, as the heron is extremely dangerous, and has been frequently known to injure the hawks with its sharp back when on the ground, though it is all but perfectly harmless while in the air. When the heron's wounds have been dressed—for this bird is rarely killed in such encounters—a ring with the captor's name is usually affixed to its leg, after which it is set at liberty, and so becomes available for future sport. The falconer's usual cry of encouragement to his hawks upon the springing of the quarry, is "Hooha-ha-ha-ha!" His cry when the quarry is killed, is "Whoop!" A falcon takes its pray either by tearing or *raking* it with the *hind* claw of each foot at the instant of passing, or by clutching the victim with its talons, and when she thus succeeds in binding to her quarry, she slowly descends with it to the ground. The supposition that the hawk strikes its quarry with the beak or breastbone in its swoop is a mistaken one.

Besides the peregrine falcon, the merlin is trained for F., and is extremely bold. This bird, however, is flown at small game, chiefly larks. The goshawk, though it does not soar and stoop, flies direct at its game: it is used chiefly for pheasants, rabbits, hares, etc., in an inclosed country. The sparrow-hawk, from its extreme boldness, is a great favorite, but is flown at smaller kinds of birds only, such as blackbirds and thrushes, etc. The hobby is seldom or never used.

The following are the principal terms used in falconry. A falcon's legs, from the thigh to the foot, are termed *arms;* toes, *petty singles;* claws, *pounces;* wings, *sails;* tail, *train;* crop, *gorge;* lower stomach, *pannel;* feathers, hair, etc., ejected at the mouth, *the castings.* A young hawk from the nest is *an eyess* or *eyas;* one that can hop, but not fly well, *a brancher;* a nestling hawk reared at liberty, is a *hack-hawk;* a young hawk able to take game, a *soar-hawk;* a mature wild hawk is a *haggard* or *blue hawk;* young hawks taken in their migrations, are *passage-hawks,* or *red hawks*—the term *red* being applied merely as a title of distinction between the young hawk and the eyess or nestling, the colors of the two being in reality the same. The training of the passage-hawk and haggard is termed *reclaiming;* fluttering, is *baiting;* fighting with each other, *crabbing;* sleeping, *jouking.* The prey is termed the *quarry.* When the hawk strikes her quarry in the air and clings to it, she *binds;* when she flies off with it, she *carries;* when she plucks it, she *deplumes.* Dead game is *the pelt. Stooping* or *swooping* is the act of descending with closed wings from a height at prey. Direct flight, without soaring, is *raking off;* changing from one bird to another, *checking.* When games flies into a cover, it *puts in.* When the hawk is molting her feathers, she is *mewing;* after her first molt, she is *intermewed;* with complete plumage, *summed;* when in good condition, she is *enseamed;* when out of condition, *seamed.* Mending the feathers artificially (an operation frequently performed when one has been accidentally broken) is termed *imping;*

blunting bill and talons, *coping*. When the falcon is obediently flying round in the air, she *waits on her master;* flying long-winged hawks from the wrist, is termed *flying out of the hood;* a couple of hawks is a *cast*. The *cadge* is a frame of wood, with four legs. It is carried by means of straps, which pass over the bearers' (the cadgers') shoulders, and is used, when there are several casts of hawks, to be taken to the field. The *block* is a round piece of wood, such as would be made by sawing a foot of wood out of a felled larch-tree of some 20 years' growth; and upon this the hawk sits when out of doors. Through the bottom of the block runs an iron spike, which being driven into the ground, secures the block to its place, and so prevents the hawk from dragging it away. Falcons are very pugnacious, and if not carefully kept separate, would soon kill each other. The *screen* or *perch* is a perch guarded by a falling piece of canvas, to support the hawks in case of their leaping down; upon this, the hawks are placed at night in an apartment called the *mews*.

The best works on the subject are those of Turberville and Latham respectively, as old treatises; and that of sir John Sebright, as comparatively modern. Of the more recent treatises, *Falconry in the British Isles*, by Salvin and Broderick; and *Falconry, its Claims and Practice*, by Freeman and Salvin, are standard authorities. See also Stonehenge's *British Rural Sports* (Lond., Warne & Co.)

The village of Falconswaerd, near Bois-le-Duc, in Holland, has for many years furnished falconers to almost all Europe. Sir John Sebright says: "I have known many falconers in England, and in the service of different princes on the continent, but I never met with one of them who was not a native of Falconswaerd."

FALE'MÉ, one of the most important tributaries of the Senegal (q.v.), into which it falls in lat. about 14° 40′ n., and long. 11° 48′ west. Its course has not yet been fully explored.

FALE'RII, a city of ancient Etruria, was situated w. of the Tiber, and n. of Mount Soracte. Its earliest historical appearance is in 437 B.C., when, according to Livy, the inhabitants (who were called Falisci) joined with those of Veii in assisting the Fidenates against the Romans. The Falisci were among the most dangerous enemies of Rome, and were the last of the Etrurians who submitted to its power. Their city was at last destroyed by the Romans (241 B.C.), and they themselves were compelled to choose a new site a few miles off. Here a Roman colony was settled in the time of the triumvirs, whence the place took the name of *Colonia Junonia Faliscorum*. But this Roman F. does not appear to have ever acquired any importance, for the temple which anciently attracted so many pilgrims, stood on the site of the older town. During the middle ages, however, a new city sprung up on the ruins of the Etruscan F., which finally obtained the name of *Civita Castellana* (q.v.). Ruins of the Roman or later F., consisting of a part of the ancient walls, are still visible.

FALER'NIAN WINE, so called from *Falernus Ager*, the district in which it was grown—and which lay in the northern portion of Campania, between the Massican hills and the northern bank of the Vulturnus—was one of the favorite wines of the Romans. It is described by Horace as, in his time, surpassing all other wines then in repute. In the time of Pliny, however, Falernian wine had already, owing to a want of care in its cultivation, begun to decline in quality.

FALIE'RI, MARINO, a celebrated Venetian, was b. about the year 1284. He was elected in 1354, at the age of 70, doge of Venice, and was the third of his name called to this supreme dignity. At the siege of Zara, in 1346, he defeated an army of 80,000 Hungarians, vigorously pursuing at the same time extensive siege-operations, and in the course of the war, having assumed the command of the fleet, captured Capo d'Istria. Subsequently he became ambassador of the repnblic to Rome and Genoa. Of an ungovernable and implacable temper, his bitter resentment seems to have been roused by a grossly offensive libel on his fair and youthful wife, the author of which, a young patrician named Michele Steno, owed some grudge to the doge. The punishment awarded to the young noble by a patrician tribunal seemed to F. wholly inadequate to the offense by which his ducal dignity had been outraged, and in order to avenge this double slight, he organized an audacious plot, with the object of overthrowing the republic, and massacring the heads of the aristocracy, to be followed by his own assumption of sovereign rights. The conspiracy was, however, revealed on the eve of its execution, and F. was arrested. He suffered death by decapitation on the 17th of April, 1355. In the hall of the great council, which contains the portraits of all the doges, the space allotted to that of F. is draped with a veil of sable, and bears the following inscription: "Hic est locus MARINO FALETRO, decapitati pro criminibus." A faithful representation of the plot, and of its chief confederates, is given in Byron's drama of *Marino Falieri*.

FALK, JOHANN DANIEL, 1768–1826; b. Germany. By the fame of a volume of satires, he made his way into the best literary society of the time. When the French invaded Germany, he went into the army, and so distinguished himself at the battle of Jena that he was made a councilor of legation. In 1813, he started a society for friends in necessity, and about the same period he founded an institute for the care and education of neglected orphan children, which subsequently became a free public school. In

1804, he published *Amphytrion*, a comedy, and *Prometheus*, a tragedy. For six years he published a satirical almanac, in which he so vigorously attacked the management of hospitals, that a movement for reform was begun and resulted successfully. In 1806, he founded a critical journal called *Elysium and Tartarus*.

FALK, PAUL LUDWIG ADALBERT, b. Prussia, 1827. He was the son of a Protestant clergyman, attended the Friedrich's gymnasium at Breslau, and studied law at the university of the same city. In 1847, he entered the state service of Prussia; in 1850, he was appointed state attorney at Breslau, and in 1853 state attorney at Lyk. In 1858, he was elected to the Prussian chamber of deputies, and served as a member of the committee on petitions, budget, and military affairs, 1858–61. In 1862, he was appointed councilor of the court of appeals in Glogau, Silesia, and in 1867 was elected to represent that district in the provisional parliament of the North German union. In 1868, he was permanently assigned as privy-councilor to the ministry of justice, and devoted himself zealously to the new codification of laws for the North German union, and afterwards for the German empire. In 1871, the emperor appointed Dr. Falk one of the representatives of Prussia in the federal council, where he acted as chairman of the committee of justice, and rendered important services in the reorganization of the system of legal proceedings. In 1872, Von Mühler, the secretary of state for ecclesiastical, educational, and medical affairs, resigned; and Falk was appointed his successor. In 1872, he introduced a law, which was passed Mar. 11 of the same year, according to which the supervision of all schools was declared to be the exclusive prerogative of the state. The law was carried against the united efforts of the Roman Catholic and conservative Protestant parties of the Prussian parliament. The bishops of the Roman church made a determined opposition to the new policy, instructing the clergy in a joint pastoral letter not to lay down their offices as school inspectors without previously consulting the diocesan bishop, In a memorial addressed to the government, they declared that they regarded this law as an encroachment upon the inalienable holy right of the church. Falk, however, continued by a number of measures to assert the exclusive right of the state to legislate in all school affairs. A rescript of June 15, 1872, excluded members of ecclesiastical orders and congregations from holding positions in the public schools. In May, 1873, an act was passed conferring upon the state the right of supervising Roman Catholic seminaries. It was required also that candidates for the clerical office should undergo a certain amount of secular training at the universities, and that every ecclesiastical appointment should receive the sanction of the secular authorities. A royal tribune for ecclesiastical matters was also set up. This legislation, which the pope denounced as invalid, was disregarded by the Roman Catholic bishops, and prince Bismarck, supported by Dr. Falk, imposed penalty after penalty in order to establish the supremacy of the state. Refractory bishops were imprisoned, deposed, and banished; the contributions of the government were withdrawn from the clergy who incurred its displeasure; religious orders were dissolved; and the administration of church property was taken from the clergy and invested in bodies of laymen. These measures have been famous as the May laws. Dr. Falk lost his seat for Berlin at the general election of members of the imperial parliament in July, 1878. Puttkamer, the present minister of ecclesiastical affairs, is of a more conciliatory nature, and, acting on instructions from prince Bismarck, he introduced a bill popularly known as the *Canossa* bill. This new bill is a great modification of the Falk laws, and was adopted July 14, 1880, in the diet, by only 206 against 202 votes. Its period is limited to Jan. 1, 1882. The most important concession consists in the permission granted to German clergymen to be educated in institutions of learning over which the Prussian government has no control, and over which the Jesuits preside. The alleged motive was to relieve the distress of the Roman Catholic population, and to fill numerous vacancies created by former removal of refractory priests.

FALKIRK, a Scottish parliamentary burgh, finely situated on a rising ground in the midst of a populous mineral and manufacturing district in Stirlingshire, and overlooking an expansive "carse," through which the river Forth, with its beautiful landscapes and constant life of sailing-vessels, slowly winds its devious way. F. consists principally of a long, irregular street, where there is an equestrian statue to the duke of Wellington, erected by public subscription in 1854. In 1859, a commodious exchange was built, in which a well-attended stock-market is held every Thursday. In 1868, excellent county buildings were erected, as well as also a new prison and county police-office. A hall, with accommodation for prosecuting various studies, was opened in 1878, for the Falkirk school of arts. A little to the s. of the town, the Union canal passes through a tunnel nearly half a mile in length. Pop. '71, 10,338. In 1600, F was made a burgh of barony by king James VI., in favor of Alexander lord Livingstone, afterwards earl of Callander, in whose favor also it was in 1646 created a burgh of regality by king Charles I. In 1715, it passed to the crown by the forfeiture of the earl of Linlithgow and Callander; and it was not till the passing of the reform bill in 1832 that it was made a parliamentary burgh, and received a municipal constitution, with a council of twelve, including a provost, three bailies, and seven councilors. It unites with Airdrie, Hamilton, Lanark, and Linlithgow, in sending a member to parliament. It has nine yearly fairs, an extensive inland trade, various local manufactures, and charitable insti-

tutions. Its parish church—the Eglais Bhrec, Varia Capella, or Speckled Kirk of our chartularies and of local tradition—has one or two monuments of some antiquity, but was itself rebuilt in the year 1810. The church, church lands, and barony belonged of old to the abbey of Holyrood. Near F., in 1298, sir William Wallace made his masterly retreat from the disastrous battle (see FALKIRK, BATTLE OF) in which he lost his brave companions in arms, sir John Graham and sir John Stewart, both said to be interred in the parish church-yard. The inscribed stone alleged to cover the grave of sir John Graham, is apparently more modern than his time. In 1746, the neighborhood of F. was the scene of another battle, in which the royal troops were defeated by those of prince Charles Edward. It is now chiefly noted for its cattle-trysts (cattle fairs), at which stock is yearly sold to the value of about £1,000,000. In the immediate vicinity are the Carron iron-works. F. is a station on the North British railway, and has water communication by the Forth and Clyde canal.

FALKIRK, BATTLE OF. Wallace had followed up his victory over the English near Stirling in 1297, by taking possession of some of the more important fortresses of Scotland. In the following year, king Edward, having returned from Flanders, summoned a great army to meet him at York, and marched northward to Roxburgh, and thence along the e. coast of Scotland and the shore of the firth of Forth. It was not till the day of the battle, the 22d July, 1298, that Edward first saw the enemy. The Scottish infantry, much inferior in numbers to the English, were arranged in four circular bodies on a small eminence near Falkirk, and were armed with lances, and with bows and arrows. The cavalry, numbering only 1000 men, were placed in the rear. This array was charged by the English cavalry. The Scottish footmen bravely withstood the onset of the well-appointed English horse; but the cavalry, dismayed by the preponderating numbers of the enemy, rode from the field without striking a blow. Thus left without support, the spearmen and archers were compelled to yield, and the retreat became general. The loss on the Scottish side is said to have amounted to 15,000 men. The results of this defeat were, that the military power of Scotland, such as it was, was broken; and Edward returned to England master of all the important strongholds of the south.

FALKLAND, a royal burgh of Scotland, in the co. of Fife, is situated at the north-eastern base of the Lomond hills, 22 m. n. of Edinburgh, and 10 m. s.w. of Cupar. The e. Lomond hill rises so abruptly behind the town as to intercept the rays of the sun from it for several weeks during winter. F. was in early times a manor of the earls of Fife. It passed from them to the crown in 1425, and was made a royal burgh by James II. in 1458. Within the town are the remains of Falkland palace—a large tower (in the same style as the north-western tower of Holyrood) above a vaulted doorway leading into the courtyard, built about 1500, and two sides of a quadrangle, built between 1530 and 1550, fine and interesting examples of Scottish architecture. The palace was a favorite residence of king James IV., and after his death, in 1513, his widow, the impetuous sister of king Henry VIII. of England, was here kept in restraint for a season. Here her son, king James V., died in 1542. The last king who occupied the palace was Charles II., who passed a few days in it in 1650. Of the more ancient castle in which David, duke of Rothesay, was imprisoned and starved to death by the duke of Albany, in 1402, no traces now remain. F. is frequently alluded to in the verses of sir David Lindsay. Pop. '71, 1283, who support themselves mainly by hand-loom weaving.

FALKLAND, LUCIUS CARY, Viscount, was b., it is believed, at Burford, in Oxfordshire, in 1610, and educated first at Trinity college, Dublin—his father, Henry Cary, viscount F., being at that time lord-deputy of Ireland—and afterwards at St. John's college, Cambridge. Even during his father's lifetime he enjoyed an ample fortune, left him by his grandfather. His earlier years were wholly devoted to study, and to the conversation of learned men, among whom he himself, by all accounts, must have occupied a first place. His residence (Burford) was only 10 m. from Oxford, and here, according to Clarendon, "he contracted familiarity and friendship with the most polite and accurate men of that university." The praise which that historian bestows on him is extraordinary; but F. is one of those historical personages whose character and abilities we must take on the word of friends and panegyrists, if at all, for his deeds and writings are not equal to his fame. In 1633, he was made one of the gentlemen of the privy-chamber to Charles I., and took part in the expedition against the Scots in 1639. In 1640, he entered parliament as member for Newport in the isle of Wight, and was at first distinguished by his patriotic zeal for the laws and constitution of his country. Against such men as Strafford and Finch he exhibited great severity of speech, though even in their case his almost finical love of the forms of legal procedure was manifested. Shortly after, he conceived it to be his duty to assume quite a different political standpoint, and to oppose what seemed to him the excesses and illegalities of the popular party. On the breaking out of the civil war, he consequently took part with the king, though mourning deeply the miseries which his country was about to suffer. He died a soldier's death at the battle of Newbury, Sept. 20, 1643. F. was quite unfitted to play a practical part in the sanguinary politics of his time; but his genuine love of England, and of the rights of the nation, which burned in him as

strongly when a royalist as when attacking Strafford and the bishops, enables us to understand better than we might otherwise have done, the deep indignation that possessed the English gentlemen who represented the commons, at the arrogant and unprincipled policy of Charles's advisers. F. wrote various treatises, etc., the principal of which is *A Discourse on the Infallibility of the Church of Rome.*

FALKLAND ISLANDS, the only considerable cluster in the South Atlantic, lie about 300 m. to the e.n.e. of the strait of Magellan, stretching in s. lat. from 51° to 52° 30', and in w. long. from 57° 40' to 61° 20'. After having successively belonged to France and Spain, they have, since 1771, formed part of the British empire, and in 1833 they began to be settled, being, as a whole, the most southerly of the organized colonies of England. These islands number about 200, presenting a total area of about 6500 sq. miles. The two largest members of the group, East Falkland and West Falkland, comprise between them more than half the surface; and of the remainder the chief ones are Great Swan, Saunders, Keppel, Pebble, Eagle, and Jason. This possession is valuable mainly from its position with respect to the Southern and Pacific oceans, being in this connection all the more valuable on account of its many excellent harbors. Both the soil and the climate are much better adapted to pasturage than to cultivation. While the natural grass is extremely luxuriant, scarcely anything but a few vegetables is grown in the settlement. The coasts teem with fish, more especially with cod; and in certain seasons of the year, penguins and seals are killed in great numbers, for the sake of their oil. The temperature is very different from that of the corresponding parallels in the s. of England—being both lower in summer and higher in winter. The mean of the former season is about 53° F., and the latter about 40°. These averages considerably exceed the vague estimates of early navigators, who, coming suddenly down from the tropical heats, appear to have felt here, by comparison, something of hyperborean cold. Though there is no timber worthy of the name, yet peat abounds to the depth of 10 feet. Pop. '71, 803; '77, 1336, of whom only 384 were females. Revenue of the colony in 1877, £3,286; expenditures, £6,266. Imports from England in 1877, £27,809; exports (chiefly wool, with oil, hides, tallow, and seal skins), £65,891. A good many acres have been reclaimed for horticulture in the neighborhood of Stanley, the seat of government; and a little barley and oats is cultivated. There is only one indigenous quadruped found, a kind of fox. Large cattle are now numerous. The sheep are chiefly Cheviots and Southdowns, of which the mutton finds a ready market on the spot. There are deposits of guano on West Falkland. The governor, the executive council, and the legislative council of the F. I. are all appointed by the crown.

FALL. The doctrine of the F. is the doctrine of the historical introduction of evil into the world, as described in the third chapter of the book of Genesis. The statement of this chapter, in its natural and obvious meaning, is to this effect, that the serpent, which "was more subtil than any beast of the field which the Lord God had made," tempted the woman to eat of the tree of the knowledge of good and evil, regarding which the Lord God had said, "Thou shalt not eat of it: for in the day that thou eatest thereof, thou shalt surely die." In contempt of this command and warning, "the serpent said unto the woman: 'Ye shall not surely die; for God doth know that in the day ye eat thereof, then your eyes shall be opened, and ye shall be as gods, knowing good and evil.' And when the woman saw that the tree was good for fruit, and that it was pleasant to the eyes, and a tree to be desired to make one wise, she took of the fruit thereof, and did eat, and gave also unto her husband with her, and he did eat." The result of this was, that their eyes were opened, and they knew that they were naked; and when they heard the voice of the Lord in the garden, they hid themselves; and on being summoned, they acknowledged their transgression, and were driven forth from Eden. Separate punishments, also, as the consequence of the transgression, were denounced against the serpent, the woman, and the man. The first was cursed above all cattle, and condemned to go upon its belly, and to eat dust all the days of its life. Enmity was to be put between it and the woman, and between its seed and her seed; "it shall bruise thy head, and thou shalt bruise his heel." The woman was to bring forth children in sorrow, and to be subject to her husband, to whom her desire was to cleave. The ground was cursed for the man's sake, and he was to eat of it in sorrow all the days of his life; in the sweat of his face he was to eat bread till he returned to the ground.
